- Women and Prisons. 163.
- Working Life of Women. By Miss B. L. Hutchins. 157.
- Workmen's Compensation Act. 82.

Why are the Many Poor?

WE live in a competitive society with Capital in the hands of individuals. What are the results? A few are very rich, some well off, the MAJORITY IN POVERTY, and a vast number in misery.

Is this a just and wise system, worthy of humanity? Can we or can we not improve it?

Hitherto it has escaped condemnation only because we are so ready to accept established custom, and because such general ignorance prevails both as to the evils to which our industrial disorder inevitably gives rise and as to our power to avert them.

The competitive system, which leaves each to struggle against each, and enables a few to appropriate the wealth of the community, is a makeshift which perpetuates many of the evils of the ages of open violence, with an added plague of tricks of trade so vile and contemptible that words cannot adequately denounce them.

What can be said in favor of a system which breeds and tolerates the leisured "masher," who lives without a stroke of useful work; the wage-slave workers, who toil for the mere mockery of a human life; the abject pauper and the Ishmael-minded criminal;—which makes inevitable and constant a three-cornered duel of dishonesty between the producer, the middleman, and the consumer?

What is Capital?

It is the sum of our instruments of production, and of the advantages of the work of former years. Its use is to be found in devoting it to the benefit of all; its abuse in leaving it in the hands of a few to waste its revenues in their own personal gratification. The present system gives to the few the power to take from the workers a huge portion of the product of their labor—

the labor which alone makes fruitful the capital bequeathed by generations of social industry.

What does it give to the many?

Their portion is poverty. This is the inevitable outcome of their competition for wages, and none know so well as the workers the full burden of that terrible and long-continued demoralisation which is brought about, not merely by the poverty of a generation, but by generations of poverty. With the smallest of chances the poor are expected to display the greatest of virtues. On scanty and uncertain wages they must struggle to maintain the independence, self-respect, and honesty of men and women, and to put by something for the rainy day that is sure to come.

Let the least depression take place in the labor market, and the worker is pitted against his fellow. The poverty of one is underbid by the greater need of another; and the competition for work reduces the highest wage of some and the lowest wage of all occupations to a pittance just above the starvation point, at which the least failure of health or work leads to pauperism.

This happens to nearly every worker; whilst the capitalist often retires with a fortune on which he, his children, and his children's children live without useful industry. Here is one out of many instances. The son of an owner of ironworks is now in the House of Lords; he has a fine town house and two or three country mansions; his children are brought up in ease and luxury. But where are the children of those whose work made the fortune? They toil from morning to night for a bare living as did their fathers before them.

This ceaseless labor of the workers continually enriches those already rich, until extreme wealth enables a privileged minority to live in careless luxury, undisturbed by the struggle for existence that goes on beneath them.

Have laborers no right under the ~~sun~~ but to work when capitalists think fit, and on such terms as competition may determine? If the competitive standard of wage be the true one, why is it not applied all round? What, for instance, would be the competitive value of a Duke, a Bishop, or a Lord-in-Waiting?

Do economists, statesmen, and sociologists stand hopeless before this problem of Poverty? Must workers continue in their misery whilst professors and politicians split straws and wrangle over trifles?

No! for the workers must and will shake off their blind faith in the Commercial god Competition, and realise the responsibility of their unused powers.

If Capital be socialised, Labor will benefit by it fully, but while Capital is left in the hands of the few, Poverty must be the lot of the many.

Teach, preach and pray to all eternity in your schools and churches: it will avail you nothing until you have swept away this blind idol of Competition, this misuse of Capital in the hands of individuals.

You who live dainty and pleasant lives, reflect that your ease and luxury are paid for by the misery and want of others! Your superfluities are the parents of their poverty. Surely all humanity is not burnt out of you by the gold your fathers left you!

Come out from your ease and superfluities and help us!

You who suffer, think of this also; and help forward the only cure for these evils. The time approaches when Capital can be made public property, no longer at the disposal of the few, but owned by the community for the benefit of all. You can help to do this; without you it cannot be done. The power is in your hands, and chances of using that power are constantly within your reach. Neglect those chances, and you and your children will remain the victims of Competition and Capitalism—ever struggling—ever poor!

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

FABIAN ESSAYS IN SOCIALISM. New Preface by BERNARD SHAW. Paper 6d. net; cloth 1/6; postage 2½d. and 4d.

WHAT TO READ on Social and Economic Subjects. Fifth edition, revised to October, 1910, and enlarged. Interleaved, paper, 1s. n. cloth 2s. n., post. 2d.

THIS MISERY OF BOOTS. By H. G. WELLS. 3d., post free 4d.

TRACT INDEX AND CATALOGUE RAISONNÉ. 3d.

FABIAN TRACTS and LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 78, 3s.; post free 3/5. Bound in Buckram, 4/6 n.; post free 5s.

I.—General Socialism in its various aspects.

State Control of Trusts. 86. Municipal Drink Traffic. 84. Economics of Direct Employment. 83. State Arbitration and the Living Wage. **LEAFLET.**—104. How Trade Unions benefit Workmen.

III.—Local Government Powers: How to use them.

TRACTS.—137. Parish Councils and Village Life. 109. Cottage Plans and Common Sense. By RAYMOND UNWIN. 76. Houses for the People. 99. Local Government in Ireland. 82. Workmen's Compensation Act. New edition for the Act of 1906. 62. Parish and District Councils. 54. The Humanizing of the Poor Law. By J. F. OAKESHOTT. **LEAFLETS.**—134. Small Holdings, Allotments and Common Pastures: and how to get them. 20. Questions for Poor Law Guardians. 68. The Tenant's Sanitary Catechism. 71. Ditto for London. **FABIAN MUNICIPAL LEAFLETS** (Nos. 32, 37 and 90 to 93). Municipalization of the Gas Supply. A Labor Policy for Public Authorities. Municipalization of Milk Supply. Municipal Pawnshops. Municipal Slaughterhouses. Women as Councillors. 1/- per 100.

IV.—General Politics and Fabian Policy.

127. Socialism and Labor Policy. 116. Fabianism and the Fiscal Question: an alternative policy. 108. Twentieth Century Politics. By SIDNEY WEBB. 70. Report on Fabian Policy. 41. The Fabian Society, its Early History. By BERNARD SHAW.

Fabian Tract No. 5.

FACTS FOR SOCIALISTS

SHOWING

THE DISTRIBUTION OF THE NATIONAL INCOME
AND ITS RESULTS.

PUBLISHED AND SOLD BY

THE FABIAN SOCIETY.

"No one can contemplate the present condition of the masses of the people without desiring something like a revolution for the better" (Sir R. GIFFEN, "Essays in Finance," vol. ii., p. 393).

TWELFTH EDITION (REVISED AND ENLARGED). 137TH THOUSAND.

PRICE TWOPENCE.

LONDON :

THE FABIAN SOCIETY, 25 TOTHILL STREET, WESTMINSTER, S.W.
MAY, 1915.

FACTS FOR SOCIALISTS

FROM THE
POLITICAL ECONOMISTS AND STATISTICIANS.

I.—The Nation's Income.

THE annual income of the United Kingdom has been estimated by the following authorities :—

Sir R. Giffen, <i>The Wealth of the Empire</i> , Journal of Royal Statistical Society, vol. lxvi. part iii. 1903	£ 1,750,000,000
Professor A. L. Bowley, M.A. (Appointed Teacher of Statistics, University of London), <i>Economic Journal</i> , September, 1904 ; Income for 1903	1,800,000,000
Professor A. L. Bowley (<i>Economic Journal</i> , March 1913, p. 54), for 1907	1,945,000,000
<i>Census of Production</i> for 1907, between 1,918 and 2,158 millions (Cd. 6,320, 1912, p. 33), say	2,000,000,000
Mr. L. G. Chiozza Money, M.P., <i>Riches and Poverty</i> (1912 edn., p. 47), for 1909	1,844,000,000
<i>The Statist</i> (27th April, 1912), for 1912, in- cluding allowance for married women, housekeepers, and others	2,250,000,000
The Chancellor of the Exchequer (Mr. Lloyd George) in his War Budget Speech (November, 1914), for 1914 ...	2,300,000,000

The gross assessments to income tax have risen from £601,450,977 in 1881-2 to £1,111,456,413 in 1912-13 (Inland Revenue Report, Cd. 7,572). Allowing for a corresponding rise in the incomes not assessed and in the wages of manual labor, we may estimate the **national income for 1912** at not less than **£2,200,000,000**. The population in 1911 being 45,221,615 (Cd. 7,022), the average annual

income is about £48½ per head, or £195 per adult man. In 1840 it was about £20½, in 1860 £26½ per head (Mulhall, *Dictionary of Statistics*, p. 245), and for 1905-6 we estimated it at £46½ per head (*Facts for Socialists*, 11th edn., 1908).

These figures (which are mainly computed from income tax returns and estimated average rates of wages) mean that the price in money of the commodities and services produced in the country during the whole course of a year was about £195 per adult man.* Most of these commodities and services were used up within that period in maintaining the 45,221,615 inhabitants, but no less a sum than £320,000,000 to £350,000,000 was saved annually previous to the war of 1914. (*Census of Production*, Cd. 6,320, 1912, p. 33. Estimate for 1907.) The bulk of this "saving" consists of new houses and of new railways, steamers, machinery, and other aids to future labor, partly for use in this country and partly sent abroad. It was calculated that £100,000,000 was in this way invested abroad in 1907 (*Census of Production*, p. 32).

Total Income £2,200,000,000.

II.—Who Produces It.

The desirable commodities and useful services measured by this vast sum are produced solely by the "efforts and sacrifices" (Cairnes), whether of muscle or of brain, of the working portion of the community, employed upon the gifts of Nature.

"No wealth whatever can be produced without labor" Professor Henry Fawcett (Cambridge) (*Manual of Political Economy*, p. 13).

"That useful function, therefore, which some profound writers fancy they discover in the abundant expenditure of the idle rich turns out to be a sheer illusion. Political economy furnishes no such palliation of unmitigated selfishness. Not that I would breathe a word against the sacredness of contracts. But I think it is important, on moral no less than on economic grounds, to insist upon this, that no public benefit of any kind arises from the existence of an idle rich class. The wealth accumulated by their ancestors and others on their behalf, where it is employed as capital, no doubt helps to sustain industry; but what they consume in luxury and idleness is not capital, and helps to sustain nothing but their unprofitable lives. By all means they must have their rents and interest, as it is written in the bond; but let them take their proper place as drones in the hive, gorging at a feast to which they have contributed nothing." (*Some Leading Principles of Political Economy*, p. 32, by the late John Elliott Cairnes, M.A., Emeritus Professor of Political Economy at University College, London; 1874.)

III.—Who the Workers Are.

Those who profess to be taking part in the work of the community were divided, at the census of 1911, as follows:

* The estimated amount of metallic money in the country was, in 1911, about £148,000,000, or about £3 per head. The Report of the Deputy Master of the Mint, (1911), puts the value of gold coins in circulation at £113,000,000 (of which sum the bankers hold about £45,000,000), and to this must be added gold bullion at the Bank of England, about £20,000,000, and silver and bronze coins in circulation, estimated at £15,000,000. (In 1914 the currency system was somewhat changed by the war.)

			Males.	Females.	Total.
Industrial	10,177,042	3,239,011	13,416,053
Agricultural	1,862,575	167,300	2,029,875
Commercial	727,457	125,412	852,869
Domestic	398,662	1,618,108	2,016,770
Professional	880,726	439,618	1,320,344
			<hr/>	<hr/>	
			14,046,462	5,589,449	19,635,911
Unoccupied, under 20...			7,091,183	7,706,380	14,797,563
Unoccupied, over 20	808,850	9,979,291*	10,788,141
			<hr/>	<hr/>	
Total	21,946,495	23,275,120	45,221,615

(Compiled from Reports of the 1911 Census of England and Wales, Scotland and Ireland.)

The figures for England and Wales may be given in more detail as follows :

			Total.	Males.	Females.
Domestic Indoor Service	1,302,438	41,765	1,260,673
Agriculture	1,229,555	1,184,714	94,841
Coal Mining	971,236	968,051	3,185
Building	817,942	814,989	2,953
Cotton Manufacture	623,825	250,991	372,834
Local Government (including Police and Poor Law)	588,951	412,501	176,450
Railway Companies' Service...			542,969	535,799	7,170
Engineering and Machine Making, Ironfounding and Boilermaking	510,226	502,942	7,284
Dressmaking	336,955	3,826	333,129
Teaching	300,831	89,648	211,183
Inns, Hotel Service	289,056	178,550	110,506
Grocery	269,322	210,387	58,935
Tailoring	254,828	127,301	127,527
Printing, Bookbinding and Stationery	249,465	161,856	87,609
Wool and Worsted Manu- facture	233,189	105,552	127,637
Boot, Shoe, etc., Making	217,986	172,000	45,986
Drapery	204,126	93,171	110,955

A MILLION CIVIL SERVANTS.

299,599 persons, comprising 248,624 males and 50,975 females are classified as being engaged in the Central Government of the country, an increase of 46 per cent. since 1901, or 42·3 for males and 69·5 for females. The Post Office workers, excluding artisans and laborers (125,698), form nearly three-quarters of the total, and nine-tenths of the females. In addition, the men and women engaged in the

* Most of these are married women engaged in unpaid domestic work, although not so described.

local government service numbered 588,951. The total for the United Kingdom amounts to probably a million national or local government officials.

Professional occupations and their subordinate services accounted for 714,621 (367,578 males and 347,043 females) in England and Wales alone, or 108,361 more than in 1901. The comparative totals for the principal professions were :

	1901.	1911.
Barristers and Solicitors	20,998	21,380
Law Clerks	34,433	36,265
Physicians and Surgeons	22,698	25,048
Dentists	5,309	7,674
Veterinary Surgeons... ..	2,941	2,612
Midwives	3,055	6,602
Teachers (excluding Music)... ..	230,345	251,968
Art, Music, and Drama	102,305	125,006

Among the professed workers there are, of course, many whose occupation is merely nominal. The number is swelled by the "sleeping" partners, the briefless barristers, the invalids, and the paupers, prisoners, and sinecurists of every description. Many thousands more have occupations useless or hurtful to the community; and others, as for example many domestic servants, labor honestly, but for the personal comfort of the idlers, and they might, therefore, as far as production is concerned, as well be themselves idle.

IV.—How the Idle Rich Live.

"Whence is their purchasing power derived? It does not descend to them from the skies; nor is it obtained by submarine telegraph direct from California or Australia; nor is its presence exhaustively accounted for by the presence of certain figures on the credit side of their accounts in their bankers' books" (Professor J. E. Cairnes, *Some Leading Principles of Political Economy*, p. 31).

They live, in the main, upon the portions of the national product which are called rent and interest, by the legal "guarantee to them of the fruits of the labor and abstinence of others, transmitted to them without any merit or exertion of their own" (J. S. Mill, *Political Economy*, Popular Edition, p. 129).

"It is at once evident that rent is the effect of a monopoly" (J. S. Mill, *Political Economy*, p. 255).

"Monopoly, in all its forms, is the taxation of the industrious for the support of indolence, if not of plunder" (*Ibid*, p. 477).

V.—Rent of Land and Houses.

The total profit from the ownership of lands, houses, tithes, etc., as assessed for income tax in 1912-13, was £279,536,396; the rents of mines, quarries, ironworks, gasworks, waterworks, canals, fishings, shootings, markets, tolls, etc., amounted to £47,042,115 (Inland Revenue Report, 1912-13, Cd. 7,572). Many of these are notoriously far from being fully assessed. The total "rent" of immovables of the United Kingdom must therefore amount to at least £330,000,000,

or more than one-seventh of the total produce.* Of this amount about £90,000,000 may be estimated as the annual rental value of the bare site, without buildings.†

“Great landlords are everywhere an idle class” (J. S. Mill, *Political Economy*, Popular Edition, p. 153).

Total Income, £2,200,000,000. Rent, £330,000,000.

VI.—Interest on Capital.

Interest is distinguished by economists from rent on the one hand, and “wages of superintendence,” or other payment for services on the other; but a large part of the “rent” already dealt with may also be deemed interest on capital embodied in land in the form of houses, etc.

The Income Tax Returns disclose the fact that the following sums were received as income in 1912-13 not in return for contemporaneous work, viz. :

From Public Companies	£ 323,055,934
„ Local Authorities	27,407,199
„ Coupons collected by Banks	45,482,597
„ Government Securities...	50,288,570
			<hr/>
			£ 446,234,300

A small part of this goes to institutions, foreigners, etc., and another small part to the relatively poor (Cd. 7,572).

That these amounts are understated may be inferred from Sir George Paish, who estimates “the net total of our investments in other lands” up to 1910 “at not much short of £3,500,000,000,” about half of it in our Colonies and Dependencies, and the other half in the United States and other foreign countries. Only some 5 per cent. is invested in European countries. The income from this might, he thinks, be taken at 5 per cent., or £175,000,000. (*Royal Statistical Society's Journal*, Jan., 1911.) Nearly the whole of this vast income may be regarded as being received without any contemporary services rendered in return by the owners as such.

We have, however, to add the interest on capital employed in private undertakings of manufacture or trade. This is included with “wages of superintendence” in business profit, both for the purpose of the income tax returns and in ordinary speech. The total amount of **interest** cannot therefore be less than **£490,000,000.**

Adding hereto the rent mentioned in the preceding section, we have a total of £820,000,000 for rent and interest together.

Total Income, £2,200,000,000. Rent, £330,000,000.

Interest, £490,000,000.

* In 1843 the total was (for Great Britain only) £95,284,497; in 1855 (for the United Kingdom) £124,371,885.

† L. G. Chiozza Money (*Daily Mail Year Book*, 1913), £90,000,000 for 1910-11. Sir Thomas Whittaker (*Ownership, Tenure, and Taxation of Land*, 1914, p. 95), £91,500,000.

VII.—Profits and Salaries.

But those who enjoy the vast unearned income just mentioned cannot all be accurately described as the "idle rich," though they would forego none of it by refusing to work. If they are disposed to increase it by leading active lives, they can do so; and most of them adopt this course to some extent, especially those whose share is insufficient for their desires.*

When the members of this endowed class elect to work, they are able to do so under unusually favorable conditions. Associated with them in this respect are the fortunate possessors of exceptional skill in hand or brain and the owners of literary, artistic, or commercial monopolies of every kind. These workers often render inestimable service to the community, and they are able to exact in return remuneration proportionate neither to their utility nor to the cost of their education or training, but to the relative scarcity of the faculty they possess.

The numbers and total income of this large class cannot be exactly ascertained. It includes workers of all grades, from the exceptionally skilled artizan to the Prime Minister, and from the merchant's clerk to the President of the Royal Academy.

It is convenient for statistical purposes to include in it all those who do not belong to "the manual labor class." If we take the "rent of ability" to have increased in the same proportion as the assessments to income tax, this prosperous body may be estimated to receive as **profits and salaries** for its work about **£550,000,000** annually.

THE INCOMES OF THE OWNERS AND MANAGERS.

The total amount of rent, interest, profits, and salaries was estimated some years ago as follows:—

Professor Leone Levi, <i>Times</i> , 13th January, 1885	£753,000,000
Mr. A. L. Bowley, <i>Statistical Society's Journal</i> , vol. lviii., part 2, p. 284 (1891) 912,000,000

* As the unearned income is not equally distributed, some of the participants are in comparatively humble circumstances; but it may be observed that the "manual labor class," or the poor, possess but a small fraction of the land and capital.

In 1912	The Deposits in P.O. Savings Bank	were	£182,104,564
	Trustee "	"	53,811,899
	Consols purchased for small holders	P. O. S. B....	"	26,077,858
		Trustee S. B.	"	2,704,859
	The Capital of Building Societies	was	48,896,015
	The Funds of Trade Unions, Co-operative, Friendly and other Provident Societies...	were	129,027,953
In 1911	The Funds of Industrial Life Assurance Societies	..	"	55,118,452

£497,741,600

(see *Statistical Abstract*, 1912, Cd. 7,022, and Report of Registrar of Friendly Societies), or perhaps one-thirtieth part of the total accumulated wealth (which is variously estimated at from £13,000,000,000 to £17,000,000,000), and about £42 per head of the adult workers in the "manual labor class," even supposing the whole was owned by members of that class. Against this, too, must be set the debts of the laborers to pawnbrokers, shopkeepers, and others, which amount, in the aggregate, to a considerable sum. Some of it, moreover, is counted twice over.

Since these estimates were made the wealth of the country has grown greatly, and on the basis of the increase in gross assessments to income tax, we estimate that the total drawn by the upper, middle, and trading classes amounts at present to about **£1,370,000,000** yearly, or little less than two-thirds of the total produce.

Total Income, £2,200,000,000. Rent, £330,000,000.

Interest, £490,000,000. Profits and Salaries, £550,000,000.

VIII.—The Income of the Wage-earners.

The total amount of wages has been estimated by the statisticians :

Sir R. Giffen, <i>Essays in Finance</i> (1886), vol. ii., p. 467	£ 550,000,000
Mr. J. S. Jeans, <i>Statistical Society's Journal</i> , vol. xlvii., p. 631, for 1880	600,000,000
Prof. A. L. Bowley (as above), 1891.	699,000,000
Sir R. Giffen (Evidence to Labor Commission, Question 6,909, etc.), 1893	633,000,000
Mr. L. G. Chiozza Money, for 1908 (<i>Riches and Foverty</i> , 10th edn., p. 31)	703,000,000
Mr. Sidney Webb (as below), for 1912	740,000,000

Table showing estimated earnings of employed manual wage-earners in the United Kingdom in 1912 (including board and lodging, overtime, and all other emoluments), compiled by Mr. Sidney Webb, and published in *The New Statesman*, May 10th, 1913 (figures for women revised) :—

MEN.

Class.	Numbers.	Average earnings in full week, including emoluments.	Average Wages Bill for a full week.	Yearly Wages Bill.*
		s. d.	Million £.	Million £.
Men in situations :				
Below 15s. ...	320,000 = 4%	13 0	0·21	10
15s. to 20s. ...	640,000 = 8%	18 0	0·58	27
20s. „ 25s. ...	1,600,000 = 20%	22 6	1·80	85
25s. „ 30s. ...	1,680,000 = 21%	27 6	2·31	109
30s. „ 35s. ...	1,680,000 = 21%	32 6	2·73	128
35s. „ 40s. ...	1,040,000 = 13%	37 6	1·95	92
40s. „ 45s. ...	560,000 = 7%	42 6	1·20	56·5
Over 45s. ...	480,000 = 6%	50 0	1·20	56·5
Men in situations	8,000,000 = 100%	30 0	12·00	564
Casuals ...	700,000	12 0	0·42	18·5

Boys ...	1,900,000	10 0	0·95	44
All males ...	10,600,000	25 3	13·38	626·5

Average earnings per adult man $\frac{582·5}{8·7} = \text{£}66·95$, or 25s. 9d. a week.

WOMEN.

Class.	Numbers.	Average earnings in a full week.	Average weekly Wages Bill for a full week	Yearly Wages Bill (net, as above).
		s. d.	in £100,000.	£.
Women in situations :				
Below 12s. ...	1,000,000	9 0	450	21,150,000
12s. to 15s. ...	1,500,000	13 0	975	45,825,000
Over 15s. ...	500,000	17 0	425	19,975,000
Women in Situations ...	3,000,000	12 4	1,850	86,950,000
Casuals ...	100,000	3 6	17½	822,500
Adult women ...	3,100,000	11 7	1,867½	87,772,500
Girls ...	1,500,000	7 6	565	26,550,000
All females ...	4,600,000	10 7	2,432½	114,322,500
Total Wages Bill	£740,822,500

Average earnings per adult woman throughout the year,

$$\frac{87·772}{3·1} \text{£}28·31, \text{ or } 10\text{s. } 10\frac{1}{2}\text{d. per week.}$$

Allowing for the increase since these estimates were made, we may safely say that the manual labor class receives for all its millions of **workers** at most some **£830,000,000** per annum.

* Allowing five weeks for short time, sickness, involuntary holidays and unemployment.

Rent	£ 330,000,000
Interest	490,000,000
Profits and Salaries...	550,000,000

Total (that is the entire income of the upper, middle, trading, clerical, and professional classes	1,370,000,000
Income of manual labor class	830,000,000

Total produce	£2,200,000,000*
-----------------------------	------------------------

IX.—The Classes and the Masses.

But the division of the nation's income into its economic categories does not coincide with its actual distribution among social classes. Many owners of land and capital work for profits, salaries, or wages. Many manual workers enjoy small shares of rent and interest. In particular, we have to notice the great development during the past half-century of a class numbering about three or four million persons who do not belong to what is usually spoken of as the wage-earning class (artizans and laborers of all kinds), but whose annual earnings are below £160 per family group. The total income of this class (which includes the great mass of teachers, clerks, minor officials, junior professionals, independent craftsmen, and small shop-keepers and dealers) is estimated at £232,000,000 (Chiozza Money, *Riches and Poverty*, 10th edition, p. 19) or £350,000,000 (Report of Committee of Economic Section, British Association, *Statistical Society's Journal*, December, 1910, p. 65), according as three or four millions are placed within this class.

Dividing the nation's income, not according to its economic categories, but according to how it is actually allotted, we get the following distribution for 1912 :

	Numbers.	Amount.
<i>Riches.</i> —Persons with incomes of £700 and upwards and their families	1,500,000	£700,000,000
<i>Comfort.</i> —Persons with incomes between £160 and £700 and their families	4,500,000	300,000,000
<i>Poverty.</i> —Persons with incomes less than £160 and their families ...	39,220,000	{ 830,000,000 370,000,000
	45,220,000	£2,200,000,000

(Adapted, the figures being brought down to date, from Chiozza Money, *Riches and Poverty*, 10th edn., p. 9.)

This unequal division of the fruits of the combined labor of the working community divides us, as Lord Beaconsfield said, into "two nations," widely different from each other in education, in comfort,

* In this connection it may be mentioned that the total income of the charities of the United Kingdom, including endowments, amounted in 1912 to $\frac{1}{2}$ per cent. of this total, viz., £11,295,000, besides, in addition, £1,445,000 from legacies. The total cost of poor relief in 1912-13 was £17,784,579 (*Statistical Abstract*, Cd. 7,636).

and in security. There is some limited central territory between, and some luckier few escape from the large camp in which their fellows are toiling to the more comfortable fortress of the monopolists, from which, on the other hand, others sink into destitution from extravagance or misfortune. But for the great majority the lines between these two nations are practically impassable.

The division is not based on any essential differences between individuals in industry or morality.

"Since the human race has no means of enjoyable existence, or of existence at all, but what it derives from its own labor and abstinence, there would be no ground for complaint against society if everyone who was willing to undergo a fair share of this labor and abstinence could attain a fair share of the fruits. But is this the fact? Is it not the reverse of the fact? The reward, instead of being proportioned to the labor and abstinence of the individual, is almost in an inverse ratio to it; those who receive the least labor and abstain the most" (John Stuart Mill, *Fortnightly Review*, 1879, p. 226, written in 1869).

We have seen what the "two nations" each receive; it remains to estimate their respective numbers, and the following facts supply materials for this computation:

(a) *The Comparatively Rich.*

It has been shown that the adult males without professed occupation numbered 808,850 in 1911. This represents a population of over 3,000,000, all of whom were living on incomes not derived from any specified occupation.

About 120,000 people, one-seventieth part of the population, own "about two-thirds" of the entire accumulated wealth of the United Kingdom (Chiozza Money, *Riches and Poverty*, 10th edn., 1912, p. 79).

The landlords (of more than ten acres) number only 176,520, owning ten-elevenths of the total area (Mulhall, *Dictionary of Statistics*, p. 341).

Only one hundred out of every 1,000 persons dying leave behind them £300 worth of property (including furniture, etc.), and only thirteen per hundred leave any property worth mentioning at all.

The number of estates exceeding £10,000 in value in 1912-13 upon which Estate Duty was paid was 4,002, their capital value was £192,121,358. They include five-

(b) *The Comparatively Poor.*

Mr. Mulhall, *Dict. of Statistics*, p. 320; families ... 4,774,000

Mr. L. G. Chiozza Money, *Riches and Poverty*, 11th edn., p. 47, estimates that the lower middle and working classes numbered in 1909... 39,000,000

The number of persons "employed" at wages in the industries of the Kingdom is placed at thirteen to fourteen millions, and this includes over four million women.

Mr. J. S. Jeans, *Statistical Society's Journal*, vol. xlvii., p. 631, places the number at about ... 14,000,000

Sir R. Giffen, *Essays in Finance*, vol. ii., p. 461 (1886) (separate incomes of man-

(a) *The Comparatively Rich.*

sevenths of the total net capital of the estates liable for duty (Inland Revenue Report, C. 3,686).

In 1912-13 the estates of 76 persons were proved for £61,259,339, or nearly one-quarter of the value of all estates. Of these, eleven were more than £1,000,000, twenty-four over £500,000 (Cd. 7,022).

More than one-third of the entire income of the United Kingdom is enjoyed by less than one-thirtieth of its people (Chiozza Money, *Riches and Poverty*, p. 48).

The payers of income tax (1,100,000), representing 5,500,000 people, take £909,000,000, nearly half the national income (L. G. Chiozza Money for 1908, *Riches and Poverty*, 1912, p. 44).

Mr. L. G. Chiozza Money estimates that 1,250,000 people take £600,000,000 a year, 3,750,000 people take £250,000,000 (*Daily Mail Year Book*, 1908).

Abounding Prosperity.—In addressing the Leeds Luncheon Club on May 11th, 1914, the Rt. Hon. Frederick Huth Jackson (Vice-President of the Institute of Bankers, and a Director of the Bank of England) said: "Let me ask you to compare our position now with what it was twenty years ago. The volume of our foreign trade has more than doubled, having risen from 681½ millions to 1,400 millions. Our banking deposits have just about doubled. In 1893 they were 433 millions, while they are now 867 millions. The amounts due to depositors in Post Office and Trustee Savings Banks have risen from 123 millions to 236 millions, again about double what they were. And the London Clearing House returns are even more impressive; they show an increase from £6,478,000,000 in 1893 to £16,436,000,000 in 1913."

(b) *The Comparatively Poor.*

ual labor class)... 13,200,000
Mr. A. L. Bow-
ley, *Statistical*
Society's Jour-
nal, June, 1895,
manual laborers 13,000,000

In 1908, of persons with incomes of less than £160, 39,000,000 out of 44,500,000 took £935,000,000, or a shade more than half the national income (Chiozza Money, *Riches and Poverty*, 12th edn., 1912, p. 47).

Eight hundred and seventy out of every 1,000 persons (about half of whom are adults) die without property worth speaking of, and eight hundred out of every 1,000 without furniture, investments, or effects worth £300 (Cd. 7,022).

From returns obtained from 8,121 private and Government works, employing 862,365 persons, it appears that the average annual wage per head amounted to not more than £50. These returns include the police and other public servants, but do not take any account of agricultural and general laborers (Annual Report of Labor Department, Board of Trade, 1893-4, C. 7,565).

From the table given on a preceding page it will be seen that only six per cent. of manual working wage-earning men get over 45s. per week, and that the average earnings of all the adult men are only 25s. 9d. per week. The average earnings of all the adult women are only 10s. 10½d. per week.

ACCUMULATED WEALTH.

It is very difficult to arrive at even an approximate estimate of the total value of real and personal property stored in the hands of those who have been favored by fortune. Mr. Chiozza Money, in his *Riches and Poverty* (p. 65), puts the total figure at £13,762,000,000. He constructs the following table, entitled :

THE DIVISION OF PROPERTY—AN ARGUMENT FROM THE DEAD TO THE LIVING.

Classes of estate.	<i>The Dead.</i>		<i>The Living.</i>		Average value of estates per head.
	Averages of the Death Duty Records in the five years 1904-5 to 1908-9.		Figures of columns 1 and 2 multiplied by 30 upon the assumption that each dead property owner in column 1 corresponds to 30 living ones.

£250,000 to £500,000 net..	54	20,600,000	1,620	618,000,000	381,481
£500,000 to £1,000,000 net	19	13,600,000	570	408,000,000	715,789
Over £1,000,000 net ...	7	18,100,000	210	543,000,000	2,585,714
Total estates over £500 ...	31,301	268,300,000	939,030	8,049,000,000	8,571
Grand Total ...	81,536	279,200,000	2,446,080	8,376,000,000	3,424

The Public Trustee now administers a large and increasing number of estates, the following comparison being instructive.

1908-09 ... 381 estates, valued at £3,133,000

1913-14 ... 1,573 estates, valued at £13,425,000

1908 was the first year of operation, and nearly half the estates administered are under £2,000 in value (Cd. 7,343).

STATISTICS OF INCOME AND INCOME TAX IN THE UNITED KINGDOM.*

During the past few years there has been a rapid increase in the gross income reviewed by the Inland Revenue for income tax purposes. The figures are as follows :—

* The Chancellor of the Exchequer estimates the number of income tax payers for 1913-14 at 1,190,000, as against 950,000 ten years ago, and the taxable income per income tax payer at £780.

Year.	Gross Income Reviewed. £	Income Taxed. £	Net Produce of Tax. £
1900-01 ...	833,355,513	594,106,253	29,705,312
1901-02 ...	866,993,453	607,550,919	35,440,470
1902-03 ...	879,638,546	608,606,903	38,037,931
1903-04 ...	902,758,585	615,012,373	28,188,067
1904-05 ...	912,129,680	619,328,097	30,966,404
1905-06 ...	925,184,556	632,024,746	31,601,237
1906-07 ...	943,702,014	640,048,238	32,002,412
1907-08 ...	980,117,000	671,313,000	32,380,000
1908-09 ...	1,009,935,926	693,323,082	33,408,754
1909-10 ...	1,011,100,345	686,812,104	37,679,602
1910-11 ...	1,045,833,755	697,074,032	38,344,767
1911-12 ...	1,070,142,343	720,640,587	39,631,630
1912-13 ...	1,111,456,413	755,577,547	41,574,277

In their annual report the Commissioners, as far as possible, identify income derived from investments in foreign and colonial countries. This source of income is one that is growing steadily, as the following figures show :—

1907-08 ...	£85,116,246	1910-11 ...	£100,952,723
1908-09 ...	88,837,393	1911-12 ..	103,894,667
1909-10 ...	93,264,604	1912-13 ...	110,421,797

HIGH PRICES MAKE THE POOR POORER.

On the other hand, the rise in the prices of food and other things in recent years has worsened the condition of the wage-earners. Recently the Board of Trade conducted an investigation into the matter, and, selecting the chief articles of common consumption, mainly prime necessities of life, produced the following figures (the War prices, 1914 and March, 1915, are added) :—

Average price of commodities as compared with the price of 1900 (taken as equal to 100):

	1896.	1900.	1906.	1909.	1910.	1911.	1912.	1914.	1915.
Wholesale prices ...	88·2	100	109·8	104·1	108·8	109·4	114·9	—	—
Retail prices of food (London only) ...	91·7	100	102·0	107·6	109·4	109·4	114·5	125·5	155·9

It is interesting to compare these official figures with a table prepared by the Co-operative Wholesale Society showing the cost of an average weekly family grocery order. This indicated that in a working class budget prices increased by over 20 per cent. between 1898 and 1910 (as contrasted with a 16 per cent. general rise over the same period), and shows that the wage-earning classes have been hit more heavily than other sections of the community.

All this means that unless their wages have risen considerably the workers are actually earning less now than they did in 1900, and

still less than in 1895, as the following table, drawn up by Mr. G. S. Barnes, C.B., of the Labor Department of the Board of Trade, to show the purchasing power of the sovereign, proves :—

A sovereign was worth :

Year.	s.	d.	Year.	s.	d.
1895	20	0	1905	17	11
1896	20	0	1906	18	0
1897	19	3	1907	17	7
1898	18	6	1908	17	2
1899	19	4	1909	17	3
1900	18	5	1910	16	11
1901	18	4	1911	17	0
1902	18	3	1912	16	3
1903	17	11	1914*	14	7
1904	18	0	1915*	11	10

* War prices added March, 1915.

X.—The Competitive Struggle.

Disguise it as we may by feudal benevolence, or the kindly attempts of philanthropists, the material interests of the small nation privileged to exact rent for its monopolies, and of the great nation thereby driven to receive only the remnant of the product, are permanently opposed. "The more there is allotted to labor the less there will remain to be appropriated as rent" (Fawcett, *Manual of Political Economy*, p. 123).

It is therefore "the enormous share which the possessors of the instruments of industry are able to take from the produce" (J. S. Mill, quoting Feugueray, *Principles of Political Economy*, p. 477, Popular Edition of 1865) which is the primary cause of the small incomes of the comparatively poor. That neither class makes the best possible social use of its revenues, and that both waste much in extravagance and vice, is an apparently inevitable secondary result of the unequal division, which it intensifies and renders permanent ; but it is a secondary result only, not the primary cause.

The force by which this conflict of interests is maintained, without the conscious contrivance of either party, is competition, diverted, like other forces, from its legitimate social use. The legal disposers of the great natural monopolies are able, by means of legally licensed competition, to exact the full amount of their economic rents ; and the political economists tell us that so long as these natural monopolies are left practically unrestrained in private hands, a thorough remedy is impossible.

In 1874, Professor Cairnes thought that some help might be found (at any rate by the better-paid laborers) by means of co-operation in production. He then wrote :

"If workmen do not rise from dependence upon capital by the path of co-operation, then they must remain in dependence upon capital ; the margin for the possible improvement of their lot is confined within narrow barriers, which cannot be passed, and the problem of their elevation is hopeless" (Professor J. E. Cairnes, *Some Leading Principles of Political Economy*, p. 348 ; 1874).

Forty years have passed away since these words were written, and it must now be apparent, even to the most sanguine of individualists, that the chance of the great bulk of the laborers ever coming to work upon their own land and capital in associations for co-operative production, has become even less hopeful than ever.

Professor W. J. Ashley, writing in 1914 of J. S. Mill's hopes for the future of co-operative production (self-governing workshops) as an alternative to capitalism, says :

"But these expectations have been grievously disappointed. Hundreds of experiments have been made, and there is a noble story to tell of persistence and self-denial in the scraping-together of capital ; but undertakings for co-operative production in Mill's sense have without exception failed completely, either from the business or from the co-operative point of view" (*The Economic Organization of England*, 1914, p. 175).

Yet this, according to authorities so eminent, is the only hope for the laborer under the present arrangements of society.

XI.—Some Victims of the Struggle.

The statistics hitherto quoted have been mainly based on the assumption of reasonable regularity of employment. But of the great permanent army of the "unemployed," no reliable statistics can be obtained. From returns rendered to the Labor Department of the Board of Trade by Trade Unions, it appears that in the seven years, 1905-11, the mean percentage of members unemployed was 5·4 (Abstract of Labor Statistics, Board of Trade, Cd. 6,228). The average number of persons in London whose home is the "common lodging-house" is over 30,000.

As regards the four millions of persons in the metropolis, Mr. Charles Booth tells us that 37,610, or 0.9 per cent., are in the lowest class (occasional laborers, loafers, and semi-criminals) ; 316,834, or 7·5 per cent., in the next (casual labor, hand-to-mouth existence, *chronic want*) ; 938,293, or 22·3 per cent., form "the poor" (including alike those whose earnings are small, because of irregularity of employment, and those whose work, though regular, is ill-paid). These classes, on or below the "poverty line" of *earnings not exceeding a guinea per week per family*, number together 1,292,737, or 30·7 per cent. of the whole population. To these must be added 99,830 inmates of workhouses, hospitals, prisons, industrial schools, etc., making altogether nearly 1,400,000 persons in this one city alone whose condition even the most optimistic social student can hardly deem satisfactory (*Life and Labor of the People*, edited by Charles Booth, 1891, vol. ii., pp. 20-21).

The ultimate fate of these victims it is not easy adequately to realize. In 1911 no less than 100 persons (44 in London) were recorded as having died from starvation, and of these 11 were in receipt of Old Age Pensions (Cd. 6,980). Actual starvation is, however, returned as the cause of death in but a few cases annually ; and it is well known that many thousands of deaths are directly due to long continued under feeding and exposure. Young children especially suffer.

In England and Wales in 1911, 106,642 deaths were registered as having taken place in poor law institutions, workhouses, infirmaries, schools, hospitals, and asylums, or 20·11 per cent. of the total deaths; the proportion during the ten years immediately preceding having averaged 17·88 per cent. Of these, 55,570 occurred in workhouses, 39,899 in hospitals, and 10,636 in lunatic asylums.

In London in 1911 four persons in every ten died in the workhouse, hospital, or lunatic asylum. Out of 68,505 deaths, 27,146 being under twenty years of age, 15,328 were in workhouses, 10,591 in hospitals, and 2,474 in lunatic asylums, or, altogether, 28,393 in public institutions (Registrar-General's Report, 1912, Cd. 6,578).

It is worth notice that a large number of those compelled in their old age to resort to the workhouse have made ineffectual efforts at thrifty provision for their declining years. In January, 1913, out of 275,292 inmates of workhouses, 70,087 were women, and 70,676 were children (Cd. 6,980). Among the men a very large number had been members of benefit societies, a former return revealing the fact that 25 per cent. of male inmates had in this way made an attempt to provide for a "rainy day." It is probable that one in every three London adults will be driven into these refuges to die, and the proportion in the case of the "manual labor class" must, of course, be still larger. And the number of persons who die while in receipt of outdoor relief is not included in this calculation. As in 1911 the mean number of outdoor paupers in the metropolis was 42,673 (Cd. 6,980), and the average death-rate in London was 15·3 per 1,000, it may be assumed that upwards of 650 persons died while in receipt of outdoor relief—often from its being insufficient.

16,465 persons died by fatal accidents in 1911 (Registrar-General's Report, Cd. 6,578), 1,491 losing their lives in mines, quarries, etc.; 835 on railways; 741 on mechanically propelled vehicles; 262 in working machinery; 456 by poisoning and poisonous vapors; and 203 in building operations. These are figures for England and Wales alone, and would be much increased by including the accidents in Scotland and Ireland.

The Board of Trade Report on "Railway Accidents" during the year 1913 shows that 330 railway servants were killed, and 5,379 injured, by accidents caused by the movement of trains. Of these 12 were killed and 679 injured whilst coupling or uncoupling vehicles (Cd. 6,932), and 59 men were killed and 3,060 injured in connection with shunting operations. Accidents from causes other than the movement of trains, such as unloading goods, seem to be seriously on the increase. In 1912, 53 men were killed and 22,498 injured in this way, the average of the preceding six years being 41 and 16,944 respectively. Excessive hours are referred to in the Official Report (Cd. 6,931). In one month—February, 1913—in 35,200 cases, men worked 13 hours; in 14,125 cases, 14 hours; in 5,959 cases, 15 hours; in 2,383 cases, 16 hours; in 1,154 cases, 17 hours; and in 1,361 cases, 18 or more hours.

Many of the workers, by reason of their occupation, are peculiarly liable to accident, industrial disease and poisoning. The industrial accidents and cases of poisoning reported have been as follows:—

INDUSTRIAL ACCIDENTS.

	Killed.	Injured.		Killed.	Injured.
1903 ...	4,154	115,564	1909 ...	4,133	154,357
1904 ...	3,085	115,515	1910 ...	4,704	167,653
1905 ...	4,268	122,386	1911 ...	4,307	190,764
1906 ...	4,369	135,693	1912 ...	5,252	197,958
1907 ...	4,453	156,278	1913 ...	4,863	222,061
1908 ...	4,154	158,356			

The Chief Inspector's Annual Report, 1913 (Cd. 7,491), refers to the difficulty of securing proper reporting of accidents. One firm, employing over 4,000 workpeople, reported only nine out of 73 reportable accidents in six months; another two out of 65. Scouts are posted to give warning of inspectors' visits, yet prosecutions numbered 3,872. Liverpool reported 80 accidents where from 12 to 30 hours continuous work had been performed.

CASES OF POISONING AND ANTHRAX IN FACTORIES AND WORKSHOPS.

	Cases.	Deaths.		Cases.	Deaths.
1905 ...	663	42	1910 ...	573	48
1906 ...	707	54	1911 ...	755	49
1907 ...	653	40	1912 ...	656	50
1908 ...	727	40	1913 ...	625	34
1909 ...	625	42			

Certain cases of poisoning are not reported under the Acts. In 1912 the number of these cases was 256, and included 47 deaths, making a total for that year of 912 cases and 97 deaths from poisoning.

"At present the average age at death among the nobility, gentry, and professional classes in England and Wales was 55 years; but among the artisan classes of Lambeth it only amounted to 29 years; and whilst the infantile death-rate among the well-to-do classes was such that only eight children died in the first year of life out of 100 born, as many as 30 per cent. succumbed at that age among the children of the poor in some districts of our large cities. The only real causes of this enormous difference in the position of the rich and poor with respect to their chances of existence lay in the fact that at the bottom of society wages were so low that food and other requisites of health were obtained with too great difficulty" (Dr. C. R. Drysdale, Report of Industrial Remuneration Conference, 1885, p. 130).

"Anyone who is acquainted with the state of the population of all great industrial centres, whether in this or other countries, is aware that amidst a large and increasing body of that population there reigns supreme . . . that condition which the French call *la misère*, a word for which I do not think there is any exact English equivalent. It is a condition in which the food, warmth, and clothing, which are necessary for the mere maintenance of the functions of the body in their normal state, cannot be obtained; in which men, women, and children are forced to crowd into dens wherein decency is abolished, and the most ordinary conditions of healthful existence are impossible of attainment; in which the pleasures within reach are reduced to brutality and drunkenness; in which the pains accumulate at compound interest in the shape of starvation, disease, stunted development, and moral degradation; in which the prospect of even steady and honest industry is a life of unsuccessful battling with hunger, rounded by a pauper's grave" (Professor Huxley, *Nineteenth Century*, February, 1888).

B. S. Rowntree estimated that the average income from all sources of the 11,560 working class families in York in 1899 was 32s. 8½d. per week, or £85 a year. But 1,465 families, comprising 7,230 persons, that is, 15·46 per cent. of the wage-earning class and

9·91 per cent. of the population of York, were living in "primary poverty," that is, on less than enough to provide the minimum of food, clothing, and shelter.

INFANT MORTALITY.

"The best indication probably as to whether the conditions of life in any locality are healthy or the reverse is the infant mortality" (*The Dwelling House*, by G. V. Poore).

In the Forty-Second Annual Report of the Local Government Board, 1912-13, Dr. Newsholme says: "It is a well-established fact that the circumstances of life in most urban communities are unfavorable to infants.* At birth the urban excess is usually about 8 per cent., during the first three months 11·6 per cent., in the next three months 43 per cent., and in the second half of infancy 67 per cent. higher in the urban than in the rural counties." Stalybridge had the highest infantile death-rate, 189·0 per 1,000 births in 1907-10, and in the counties the towns with the highest infantile mortality are Lancashire, Cheshire, Staffordshire, Derbyshire, Glamorganshire, and Yorkshire (West Riding), while such important centres of industry as Rhondda, Merthyr Tydvil, Hull, Nottingham, and Huddersfield earn an unenviable notoriety. The infant mortality is, as might be expected, high among the poor and low among the well-to-do, the rates being 77 per 1,000 among the upper-middle classes, 133 among the wage-earners (77 among agricultural laborers), 148 among textile operatives, 160 among miners, and 152 in the unskilled labor class (Cd. 6,909).

OVERCROWDING STATISTICS. From Censuses 1901 and 1911, General Report.

ENGLAND AND WALES—OVERCROWDING.

Tenement with	No. of 1 to 4 roomed tenements with more than two occupants per room.		No. of occupiers of such tenements.		Percentage of population in such tenements.	
	1901.	1911.	1901.	1911.	1901.	1911.
1 room	66,669	57,835	245,586	211,770	0·8	0·6
2 rooms	147,527	135,092	884,672	804,071	2·7	2·2
3 rooms	102,556	130,272	807,596	1,023,925	2·5	2·8
4 rooms	75,662	81,811	729,652	792,716	2·2	2·2
	<hr/> 392,414	<hr/> 405,010	<hr/> 2,667,506	<hr/> 2,832,482	<hr/> 8·2	<hr/> 7·8

The total number of tenements in England and Wales was, in 1911, according to the returns, 8,005,290, which gives, with a population of 36,070,492, an average of 4·5 persons to each tenement.

The five great towns in which the percentage of overcrowded persons (that is, over two persons per room) was the highest were as follows:—

Gateshead	33·7	Newcastle-on-Tyne	...	31·7
South Shields	32·9	Tynemouth	...	30·8
Sunderland	32·6			

* The infant mortality in England and Wales as a whole was 95 per 1,000 births in 1912, a welcome drop from 130 per 1,000 in 1911.

The five registration counties with most overcrowding were :—

Northumberland	...	28·7	Denbigh	10·4
Durham	28·5	Yorkshire (West Riding)	...	10·3
London	17·7			

Speaking generally, it would appear that the coal-bearing counties are those where the crowding of dwellings is most severe.

OVERCROWDED AREAS IN LONDON (CENSUS 1911).

Borough.	Tenement dwellings. Percentage consisting of				Persons living more than 2 in a room in tenements of less than 5 rooms.			
	1 room.		2 rooms.		Number.	Percentage of population.		
Bermondsey ...	14·7	...	23·8	...	26,714	...	21·2	
Bethnal Green ...	17·5	...	26·9	...	39,377	...	30·7	
Finsbury ...	27·7	...	33·6	...	33,322	...	37·9	
Hampstead ...	6·7	...	12·7	...	5,355	...	6·2	
St. Pancras ...	21·6	...	29·4	...	50,264	...	23·0	
Shoreditch ...	24·8	...	28·5	...	37,933	...	34·0	
Southwark ...	19·7	...	26·4	...	44,881	...	23·4	
Stepney ...	18·1	...	27·1	...	88,776	...	31·7	

The highest percentage of one-room tenements are in Dublin, 33·9; Glasgow, 20·0; and London, 13·4. Of three-room tenements, in Birmingham, 30·5; Edinburgh, 21·9; and London, 21·3. The proportion of population living more than two in a room to the total population was, in Birmingham, 16·8; London, 31·1 (Finsbury, 39·9); Edinburgh, 37·9; and Dublin, 53·6. Of the private family population in Hampstead about 300 of every 1,000 dwell in tenements of ten rooms or more; in Kensington, 250; in Westminster, 200; in Bethnal Green, 3; in Bermondsey and Shoreditch, 4; and in Poplar and Stepney, 6. At the Dublin housing inquiry, 1913, evidence was tendered by Councillor Miss Sarah C. Harrison showing that :—

12,296 persons were living 4 in one room.

11,335	5	..
8,928	6	..
5,978	7	..
3,448	8	..
3,014	9	..
686	10 and over.	(Cd. 7,317, p. 98.)

PAUPERISM.

We clog our public poor relief with irksome and degrading conditions, so that the honest poor often die lingering deaths rather than accept it. Mr. Charles Booth states that "as regards entering the workhouse, it is the one point on which no difference of opinion exists among the poor. The aversion to the 'house' is absolutely universal, and almost any suffering and privation will be endured by people rather than go into it" (*The Aged Poor in England and Wales*). Yet the paupers in actual receipt of public relief on one day number nearly a million :

England and Wales, January 1st, 1913	785,345	cost	£14,935,605
Scotland, January 15th, 1913	... 108,145	"	1,576,116
Ireland, January 4th, 1913	... 77,900	"	1,272,858
			<hr/>
	971,390		£17,784,579

(Statistical abstract for the United Kingdom, Cd. 7,636.)

But this relief is not usually given permanently; to obtain the number of different individuals who receive relief during a year we must multiply the mean daily number by 2.15 (Royal Commission on the Poor Law (Majority) Report, 8vo. edn., p. 32). The mean daily number of paupers in 1913 was 966,836, and therefore the total number of individuals in receipt of relief was about 2,080,000, or 1 in 8 of the manual labor class.

But in addition to this public expenditure, the various charitable societies spent, in 1912, £9,139,167 on hospitals, orphanages, and similar charities (Burdett's *Hospitals and Charities*, 1914, p. 82), and the charity of individuals is known to be enormous. The numbers of the destitute class must therefore be largely increased. Sir R. Giffen spoke, in 1886, of the class of five millions "whose existence is a stain on our civilization" (*Essays in Finance*, vol. ii., p. 350).

"To me, at least, it would be enough to condemn modern society as hardly an advance on slavery or serfdom, if the permanent condition of industry were to be that which we behold, that 90 per cent. of the actual producers of wealth have no home that they can call their own beyond the end of the week; have no bit of soil, or of so much as a room that belongs to them; have nothing of value of any kind except as much old furniture as will go in a cart; have the precarious chance of weekly wages which barely suffice to keep them in health; are housed for the most part in places that no man thinks fit for his horse; are separated by so narrow a margin from destitution, that a month of bad trade, sickness, or unexpected loss brings them face to face with hunger and pauperism. . . . This is the normal state of the average workman in town or country" (Mr. Frederic Harrison, p. 429, Report of Industrial Remuneration Conference, 1885).

XII.—The Evil and the Remedy.

"The deepest root of the evils and iniquities which fill the industrial world is not competition, but the subjection of labor to capital, and the enormous share which the possessors of the instruments of industry are able to take from the produce" (J. S. Mill quoting Feugueray, *Principles of Political Economy*, p. 447, edition of 1865).

"We have been suffering for a century from an acute outbreak of individualism, unchecked by the old restraints, and invested with almost a religious sanction by a certain soul-less school of writers" (Prof. H. S. Foxwell, University College, London, p. 249, of essay in *The Claims of Labor*, 1886).

Socialists affirm that the evil can never be remedied until the "two nations" are united by the restitution to public purposes of rent and interest of every kind, and by the growth of social sympathy promoted by the accompanying cessation of class distinctions. It will be seen by the above quotations that this position is based on the facts of the case as ascertained and declared by the recognized authorities in statistics, and is in entire harmony with the doctrines of Political Economy.

XIII.—Some Steps already taken towards Socialism.

The restriction to public purposes of rent and interest of every kind cannot be effected by revolution, or by one or a dozen Acts of Parliament. Legislative reforms must be supplemented by a thoroughly organized exercise by all local authorities, from Parish to County Councils, of the powers they already possess, as well as by the acquisition of new and more far-reaching powers. The supply of water, milk, gas, and electric light; the establishment of markets, slaughter-houses, tramways, steamboats, baths, wash-houses, cemeteries, harbors, libraries, bands, art galleries, museums, open spaces, gymnasia, allotments; the building of workmen's dwellings and municipal lodging-houses, are being carried on, here and there, by municipal authorities for the common good. They might be extended to every urban community in the kingdom if public opinion and public enterprise were sufficiently alert to their opportunities. The following figures show the influence of Socialistic principles in our municipal administration. A House of Commons Return, issued in December, 1902, gives a summary of the reproductive undertakings carried on by 299 out of the 317 municipal boroughs in England and Wales: total capital, £121,172,372; balance outstanding, March 31st, 1902, £104,925,853; average annual income for four years to March 31st, 1902, £13,368,702; average annual working expenses for the same period, £8,228,706; average annual net profit for the same period, £4,812,005 (H. C.—308, December 16th, 1902). No later returns have been made.

The transfer of rent and interest from private pockets to public purposes will be mainly brought about by means of progressive taxation in the shape of graduated death duties, a graduated differentiated income tax, and the rating of land values. The budgets of 1904, 1905, 1907, and 1909 have not only cleared the way for the application of Socialist principles to taxation, but have brought a largely increased revenue into the national exchequer. An estate duty, varying from 1 per cent. on estates of £500 to 15 per cent. on those over £1,000,000, in addition to which legacy duties varying according to the relationship of legatees from 1 per cent. to 10 per cent., are payable. The income tax is not only graduated, but also differentiated as between earned and unearned incomes. During the year 1912-13 the revenue from the death duties was £25,406,369. In the period 1894-5 to 1912-13 no less than £347,959,570 was collected from death duties, an average of £19,331,087 a year, as against £9,979,691 in 1893-4 (Cd. 7,022).

The extension of these means by the Socialist Chancellors of the Exchequer of the future will extinguish unearned incomes and, so far as taxation can do it, bring about the emancipation of the people from private monopoly.

XIV.—The Organized Forces of Socialism, Trade Unionism and Co-operation.

The strength of Socialism at home and abroad is fairly accurately represented in the following table. Where possible the figures have

been stated with as close an approximation to accuracy as is possible, and in other cases estimates have been made on a conservative basis.

Country.	Socialist-Labor Vote.	No. of M.P.'s.	Trade Unionists.	Co-operators.
Australia ...	678,812	—	433,224	42,680
Austria ...	1,041,948 (1907)	82	506,905	2,400,000
Belgium ...	600,000 (1912)	39	116,082	500,000
Denmark ...	107,015 (1913)	32	128,224	614,200
Finland...	308,782 (1913)	90	23,000	200,000
France ...	— (1914)	—	1,029,238	865,842
Germany ...	4,250,329 (1912)	111	3,629,403	4,800,000
Holland ...	144,000 (1913)	15	169,144	355,000
Italy ...	915,000 (1913)	53	847,530	1,666,800
Norway ...	126,000 (1912)	23	60,378	120,000
Russia...	800,000 (1912)	14	550,000	3,000,000
Sweden...	172,000 (1911)	65	220,000	160,000
Switzerland ...	125,000 (1911)	16	127,514	600,000
United Kingdom	529,193 (1910)	40	3,993,769	3,011,390
United States ...	900,868 (1912)	—	2,282,361	140,000

TRADE UNIONISM IN THE UNITED KINGDOM.

The growth of trade unionism in the United Kingdom is shown by the following figures :—

Year.	No. of Trade Unions.	Membership.	Percentage Increase.
1893 ...	1,221	1,488,457	—
1898 ...	1,287	1,688,531	—
1903 ...	1,218	1,931,043	—

1913 ...	1,133	3,993,769	21.5

In 1910 to 1912 the expenditure of the 100 principal Trade Unions was as follows (Cd. 7,733, p. 219) :—

	1910	1911	1912
Unemployment ...	£701,733	456,510	597,662
Dispute Benefit ...	352,346	317,912	1,374,884*
Sick and Accident Benefit...	418,998	436,262	440,047
Superannuation ...	402,797	412,150	425,182
Funeral Benefit ...	103,938	112,553	119,075
Other Benefits ...	137,777	196,552	163,187
Working Expenses ...	524,434	578,437	703,240
TOTAL ...	£2,642,023	2,510,376	3,823,277

* Coal Trade Dispute.

This represents the expenditure of from 60 to 64 per cent. of the total membership of Trade Unions.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. The Annual Report with the Rules and a list of publications can be obtained at the Office, 25 Tothill Street, Westminster, London, S.W.

MARCH 1908.

MOTHER EARTH

PEOPLE OF ALL CLASSES and of all political parties are genuinely anxious to revive village life. Thus we may prevent the constant drifting of the people to the towns, with much concurrent misery. Everyone will therefore be interested to read "Mother Earth," by MONTAGUE FORDHAM, a thoughtful and practical book on this question.

It deals not only with the economic changes needed in order that a permanent life should be built up in the country districts, but also gives important information on co-operation, on the financing of small holdings through loan societies, and on agricultural education and productivity. The building up of a stable community of agriculturists and artisans in permanent country homes and the Land Club system are also fully dealt with.

The book has been widely reviewed and highly praised. It can be obtained through all booksellers and from the Fabian Society.

A few press notices follow :—

The Economist.—"Mother Earth" should be read by all who are anxious to find remedies for the decay of agriculture.

The Globe.—Students will find much sense and ability in this short practical treatise.

The Church Times.—His book should be read by all who are concerned with the problem. It has the advantage of being a real book, written with a style.

The Manchester Courier.—It may be strongly recommended to the attention of all having any connection with the administration of the 1907 Small Holdings Act.

The Yorkshire Observer.—This book should be studied by land reformers of all shades of opinion.

The Manchester Guardian.—This beautifully printed essay has, as Mr. Hobson says, the conspicuous method of outlining a "large, bold, comprehensive and genuinely organic reform."

The Daily News says: The [Land Club] movement is so full of promise, because it has sprung voluntarily from the country people themselves. It is one of the very few efforts in modern rural England that can be called truly democratic. . . . Homes and land—that is the talisman that has called these clubs into being.

The Morning Leader.—A book so temperate and sane that all thoughtful people should read it.

The book is published in a special Library Edition, beautifully printed on deckle-edge paper at 5s. net, post free; and a Popular Edition will be issued in April at 1s. net, postage 2d.

CAPITAL AND LAND.

THE practical aim of Socialists with regard to the materials of wealth is "the emancipation of land and industrial capital from individual and class ownership, and the vesting of them in the community for the general benefit."* Land and capital are instruments with which man works for the production of wealth, material for the maintenance of his existence and comfort. Now it is important to notice that, though in common talk we separate the two, and though political economists have given a scientific dignity to this rough classification of the instruments of production, distinguishing as "land" that which has been provided by "Nature," and as "capital" that which has been made by human industry, the distinction is not one which can be clearly traced in dealing with the actual things which are the instruments of production, because most of these are compounded of the gifts of Nature and the results of human activity.

"Land."

The only instruments given to us by Nature are climate, physical forces, and virgin soil. The use of these passes with legal "property" in the land to which they belong, and they are consequently classed with "land." Those virgin soils are called good or fertile which contain in abundance elements which the chemistry of animal or vegetable life can convert into the materials of human food, clothing, etc. Other mineral elements of particular patches of soil are convertible, by the arts of the mining, metallurgic, building, and engineering industries, into a thousand forms of wealth.

How "Land" gets Value.

But even these qualities of virgin soil are of no use or value unless they are found in accessible positions; and their advantage to the proprietor of the land increases rapidly as human society develops in their neighborhood; whilst in all advanced societies we find large areas of town lands whose usefulness and value have nothing to do with their soils, but are due entirely to the social existence and activity of man. Land in Cornhill, worth a million pounds an acre, owes its value to the world-wide industry and commerce whose threads are brought together there, not to its natural fertility or to the attractions of its climate. "Prairie value" is a fiction. Unpopulated land has only a value through the expectation that it will be peopled.

* See the "Basis" of the Fabian Society, page 18.

The "natural" capabilities of land are thus increased, and, indeed, even called into existence, by the mere development of society. But, further, every foot of agricultural and mining land in England has been improved as an instrument of production by the exercise of human labor.

First, of human labor *not on* that land itself ; by the improvement of the general climate, through clearing of forest and draining of marsh ; by the making of canals, roads, railways, rendering every part of the country accessible ; by the growth of villages and towns ; by the improvement of agricultural science ; and still more by the development of manufactures and foreign commerce. Of all this human labor, no man can say which part has made the value of his land, and none can prove his title to monopolize the value it has made.

Secondly, all our land has been improved by labor bestowed especially upon it. Indeed, the land itself, *as an instrument of production*, may be quite as truly said to be the work of man as the gift of Nature. Every farm or garden, every mine or quarry, is saturated with the effects of human labor. Capital is everywhere infused into and intermixed with land. Who distinguishes from the mine the plant by which it exists ? Who distinguishes from the farm the lanes, the hedges, the gates, the drains, the buildings, the farm-house ? Certainly not the English man of business, be he landlord, farmer, auctioneer, or income tax commissioner. Only the bold bad economist attempts it, and, we must add, some few amongst our allies, the Land Nationalizers. It may be worth while to digress for a while in the company of these latter.

A Word to "Land Nationalizers."

The arguments revived in our generation by John Stuart Mill and Henry George, and the activity of the various societies that have taken in hand the work of diffusing them, have now converted an immense body of public opinion to the Socialist view of the justice of, and urgent necessity for, Nationalization of the Land ; or, at least, the absorption, by the State or Municipality, of ground rents, mining royalties, and similar unearned profits from the soil. Land Nationalizers go, generally, so far with Socialists that (in the words of the Fabian "Basis") they "work for the extinction of private property in land, and of the consequent individual appropriation, in the form of rent, of the price paid for permission to use the earth, as well as for the advantages of superior soils and sites."

But some, who are thus far Land Nationalizers, still shrink from any interference with the legal powers enjoyed by the holders of capital. Hence a most unfortunate separation exists between them and the Socialists, whose design of nationalizing the industrial capital with the land appears to them unjustifiable and unessential.

Capitalist and Landlord in One Boat.

They use the argument that capital, unlike land, is created by labor, and is therefore a proper subject of private ownership, while land is not. Socialists do not overlook the facts on which this

argument rests, but they deny, on the grounds already partly stated, that any distinction can be founded on them sufficiently clear and important to justify the conclusion drawn. But, supposing we assume it true that land is not the product of labor, and that capital is ; it is not by any means true that the rent of land is not the product of labor, and that the interest on capital is. Nor is it true, as Land Nationalizers frequently seem to assume, that capital necessarily becomes the property of those whose labor produces it ; whereas land is undeniably in many cases owned by persons who have got it in exchange for capital, which may, according to our premisses, have been produced by their own labor. Now since private ownership, whether of land or capital, simply means the right to draw and dispose of a revenue from the property, why should the landowner be forbidden to do that which is allowed to the capitalist, in a society in which land and capital are commercially equivalent ? Virgin soil, without labor upon or about it, can yield no revenue, and all capital has been produced by labor working on land. The landlord receives the revenue which labor produces on his land in the form of food, clothing, books, pictures, yachts, racehorses, *and command of industrial capital*, in whatever proportions he thinks best. The ownership of land enables the landlord to take capital for nothing from the laborers as fast as their labor creates it, exactly as it enables him to squander idly other portions of its product in the manner that so scandalizes the Land Nationalizers. When his tenants improve their holdings by their own labor, the landlord, on the expiration of the lease, remorselessly appropriates the capital so created, by raising the rent. In the case of poor tenants holding farms from year to year in Ireland, the incessant stealing of capital by this method so outraged the moral sense of the community, that the legislature interfered to prevent it long before land nationalization was commonly talked of in this country.* Yet Land Nationalizers seem to be prepared to treat as sacred the landlords' claim to private property in capital acquired by thefts of this kind, although they will not hear of their claim to property in land. Capital serves as an instrument for robbing in a precisely identical manner. In England industrial capital is mainly created by wage workers—who get nothing for it but permission to create in addition enough subsistence to keep each other alive in a poor way. Its immediate appropriation by idle proprietors and shareholders, whose economic relation to the workers is exactly the same in principle as that of the landlords, goes on every day under our eyes. The landlord compels the worker to convert his land into a railway, his fen into a drained level, his barren sea-side waste into a fashionable watering place, his mountain into a tunnel, his manor park into a suburb full of houses let on repairing leases ; and lo ! he has escaped the Land Nationalizers : his land is now become capital, and is sacred.

The position is so glaringly absurd, and the proposed attempt to discriminate between the capital value and the land value of estates

* See, for instance, the Irish Land Acts of 1870 and 1881.

is so futile, that it seems almost certain that the Land Nationalizers will go as far as the Socialists, as soon as they understand that the Socialists admit that labor has contributed to capital, and that labor gives some claim to ownership. The Socialists, however, must contend that only an insignificant part of our capital is now in the hands of those by whom the labor has been performed, or even of their descendants. How it was taken from them, none should know better than the Land Nationalizers.

It is scarcely necessary to enlarge on or illustrate the obvious truth that, whatever the origin of land and capital, the source of the revenues drawn from them is contemporary labor. The remainder of this Tract may still further impress the impossibility of maintaining any hard and fast lines between them, either as regards their characteristics and importance in developed societies, or the defensibility of their private ownership or the arguments for their nationalization.

“Capital.”

To return from our digression. When we consider what is usually called *capital*, we are as much at a loss to disentangle it from land as we are to find land which does not partake of the attributes of capital.

For though capital is commonly defined as wealth produced by human labor, and destined, not for the immediate satisfaction of human wants, but for transformation into, or production of, the means of such satisfaction in the future; yet railways, docks, canals, mines, etc., which are classed among the instruments of production as capital, are really only somewhat elaborate modifications of land. The buildings and the plant with which they are worked are further removed from the form of land, but we lump the lot as capital. All farming improvements, all industrial buildings, all shops, all machinery, raw material, live and dead stock of every kind, are called capital. And just as there is a purely social element in the value of land, so are there purely social elements in the value of capital; and its value, in all its forms, depends upon its accessibility and fitness here and now, and not on the labor it has cost. The New River Company's Water Shares had their enormous value, not because Sir Hugh Myddelton's venture was costly, but because London had become great. The usefulness of fixed and unchangeable forms of capital increases and decreases through external causes, just as does that of land. If instruments of production must be classified, the best division of them is into *immovables* and *movables*, the annual value of buildings, railways, mines, quarries, waterworks, gasworks, durable fixed machinery, and many other forms of so-called capital, manifestly agreeing with that of land in fluctuating according to causes of which the effects are generalized in the “Law of Rent” of abstract economics.

Besides industrial capital, there is a considerable amount of what has been conveniently called “consumers' capital.” Dwelling-houses, and all their domestic machinery and conveniences are as necessary for production as land and factories; for though the worker uses them in his character of consumer, they are necessary to maintain

him in efficiency for his work. All private stores of food and clothing, all forms of personal property, may likewise be classed as consumers' capital. It will, however, be evident that, in classing these as capital, the signification of that name is becoming very vague and indefinite.

Finally, we have such purely non-material and social kinds of capital as banking and credit organizations, inventions, and other devices for extending and intensifying our power over Nature ; social forces of immense importance for the carrying on of wealth production, largely capable of social ownership, not entirely capable of private monopoly, but at present appropriated by some individuals more than by others.

What is the Estimated Value of our National Stock of the above-named form of Wealth?

In December, 1889, Sir Robert Giffen attempted to compute the capital value of realized property in the United Kingdom as it was in the year 1885.* The following table is reproduced from that furnished by him, the figures being corrected according to the official Returns of Income Tax Assessments for 1905-6.† The estimate of the value of the capital is arrived at by taking what Sir R. Giffen considered a suitable number of years' purchase of the income :—

Gross Income.				No. of			Capital
Under :				Years' Purchase.			Value.
Schedule A—				£			£
Profits from the ownership of—							
Land	52,151,543	...	26	1,355,940,118
Houses	205,486,455	...	15	3,082,296,825
Other property	1,310,673	...	30	39,320,190
Schedule B—							
Profits from the occupation of lands(farmers' profits mainly)				52,421,649	...	8	419,373,192‡§
Schedule C—							
Profits from British, Indian, Colonial, and Foreign Government Securities				46,925,674	...	25	1,173,141,850
Schedule D—							
Quarries, mines and ironworks				24,379,408	...	4	97,517,632 §
Gasworks				7,413,611	...	25	185,340,275 §
Waterworks				5,816,300	...	20	116,326,000 §
Canals, etc.				3,847,201	...	20	76,944,020 §
Fishings in the U. K. and Sporting Rights in Ireland				203,304	...	20	4,066,080 §
Markets, tolls, etc.				869,635	..	20	17,392,700 §
Salt springs or works and alum works				150,573	..	20	3,011,460 §
Carried forward				£6,570,670,342

(For notes and explanations as to this table, see next page.)

* See *The Growth of Capital*, by Robert Giffen (London, Bell and Sons, 1889). Also *Essays in Finance*, 2 vols., by the same author.

† Fiftieth Report of the Commissioners of Inland Revenue [Cd.—3686], price 2s. The amount stated as annual farmers' profits appears to be excessive, as Sir R. Giffen overlooked the fact that the Income Tax Acts assume the net profits of agriculture (in England) to be equal to one-third the rent, not the whole as here given.

Gross Income.		No. of Years' Purchase.			Capital Value.
Under :	£				£
Schedule D— Brought forward...	6,570,670,342
Cemeteries	183,612	...	20	...	3,672,240 §

Government and local public					
property, say					600,000,000
					£12,671,297,243 ¶

“ Land ” and “ Capital ” Indistinguishable.

It may be noticed that there is no attempt in this table to distinguish between what Land Nationalizers might think should be classed as land, and what they would admit to be capital. The common sense of the ordinary business man and statistician recognizes that such distinction is impracticable and arbitrary. To the business

The number of years' purchase of rural land may also be regarded as too high. On the other hand, that of urban properties is much understated. But these considerations do not materially affect the aggregate total, and Sir R. Giffen's basis has therefore been throughout maintained.

‡ This includes £13,821 income assessed under Schedule D.

§ Of these totals, which make up the “ industrial capital ” of the country, amounting to £3,752,541,930, at least £3,290,275,001 is under joint stock management, £2,003,392,001 being the paid-up capital of the 40,995 registered companies carrying on business in April, 1906, and £1,286,883,000 being the paid-up capital of the railways in the United Kingdom at the end of 1906. See the Annual Statistical Abstract, fifty-fourth number, C—3691 (1907); price 1s. 7d. To this must be added the capital administered by chartered banks and trading companies not registered under the Companies Acts.

|| These amounts being conjectural only, are reproduced from Sir R. Giffen's estimate in 1885, with small additions, amounting in all to £155,000,000 on the capital value.

¶ Owing to a re-arrangement of the Income Tax Returns, the total works out at less than on the method previously in use. It is now probably a considerable understatement. If we compare this total for 1905-6 with those of previous years we find the total estimated by Sir R. Giffen in 1865 was £6,114,063,000; in 1875 £8,548,120,000; and in 1885 £10,079,579,000. In a paper read to the British Association in September, 1903, and published in the Journal of the Royal Statistical Society, Vol. LXVI.,

man they are both equally forms of property, merely different kinds of investments—that is, arrangements for obtaining a revenue from the labor of others. The practical statesman sees in them simply sources of income, and assesses them equally to income tax. Indeed, that famous tax of 20 per cent. on rent, of which the English Land Restoration League and many Radicals are demanding the revival, was not imposed as a land tax at all, but formed part of the incidence of a general tax of four shillings in the pound on the annual value of ALL REALIZED PROPERTY AND SALEABLE INTERESTS, excepting only farm stock and household furniture.* Will not the Land Nationalizers take this hint, and include *all* unearned incomes in their "Single Tax" Program?

Who own all this Land and Capital?

Who, then, are the Landlords and the Capitalists amongst us? They are those persons who own the instruments of wealth-production and enjoy the profits of them. In England, as in all developed industrial societies, almost the whole of the land and industrial capital, and most of the consumers' capital (chiefly consisting of dwelling-houses), is at present owned and controlled by one set of people, while it is another set of people who produce wealth by using them.

"Capitalists" and "Landlords."

A glance at Sir R. Giffen's table will show how little of the material wealth of England is available for immediate enjoyment or consumption, and how large a proportion is in the form of machinery to aid labor in the supply of our wants from day to day. The value of movable personal property, not employed as instruments of production, must be less than one-tenth of the total. Dwelling-houses, and the land attached to them, may amount to about two-tenths more. But occupying ownership of these properties is the exception, and most of them are used by their owners as an investment yielding rent, paid out of the earnings of working occupiers. The whole of the remainder consists of land and capital employed for wealth-production in agriculture, mining, transport, and other industries, trades, and professions.

Part III., Sir R. Giffen estimated the total capital of the United Kingdom to be £15,000,000,000. (The number of years' purchase taken above is low, and a small increase would easily account for this larger figure.) The increase in realized wealth in forty-one years may, therefore, safely be estimated at six thousand millions sterling, or an average of more than 140 millions a year. The average annual increase has been at the rate of $2\frac{1}{2}$ per cent., or nearly two and a half times the rate of increase of the population.

* It was an "Aid" (or tax upon realized property) imposed primarily upon all persons "having any Estate in ready Monies, or in any Debts whatsoever owing to them, within this Realm or without, or having any Estate in Goods, Wares, Merchandizes, or other Chattels or personal Estate whatsoever" . . . except "the Stock upon Lands and such Goods as are and for Household Stuff" . . . at the rate of "four Shillings in the Pound according to the true Yearly Value thereof," computed at 6 per cent. of their capital value (see the Act of Parliament of 1692, 4 William and Mary, cap. I., sec. 2), including also the emoluments of public officers, at that time regarded as saleable property (sec. 3), and finally "to the end a further Aid and Supply for their Majesties' Occasions may be raised," a similar tax is imposed on Lands "according to the true Yearly Value thereof at a Rack Rent" (sec. 4).

Four-fifths of our national wealth, we may safely say, consists of such instruments. The wants of the community are supplied from year to year, and week to week, by the reciprocal services of the active workers who use and administer them. The worker, of whatever kind, is paid by a wage, a salary, a professional income, or profits due to his skill in organizing or directing industry, the amount of which is determined by competition between himself and other workers. The owners of the instruments of production receive as rent and interest such an amount of the value of the produce as equalizes the normal income of the workers in each calling; that is to say, they obtain from the workers who are using their land and capital a toll equal to the difference between the product of industry engaged in with any particular instrument of land or capital, and the product of the like industry engaged in with the least efficient instrument actually employed anywhere at the time.

Some of the workers are, it is true, themselves capitalists, that is to say, own larger or smaller amounts of land and capital; and many capitalists work. How many, and how much? Here are some facts gathered from the Report of the Commissioners of Inland Revenue and other reliable sources.

Probate or administration was granted in 66,082 estates, of the net capital value of £298,460,180 in 1906-7.* They were classified as follows:—

34,296 estates not exceeding £500	aggregating	£10,001,740
10,516 estates over £500 and not exceeding £1,000 ..	"	8,616,449
17,098 " 1,000 " " 10,000 ..	"	61,588,433
4,086 " 10,000 " " 250,000 ..	"	149,959,280
58 " 250,000 " " 500,000 ..	"	21,292,964
18 " 500,000 " " 1,000,000 ..	"	12,863,132
10 " 1,000,000 " " ..	"	34,138,182

About one-seventieth part of the population owns far more than one-half of the entire accumulated wealth, public and private, of the United Kingdom. More than one-half the area of the whole country is owned by 2,500 people.†

they would own land and capital valued at ... £459,141,908§

that is to say, a little less than one thirty-second part of the land and capital with which they work. The number of *persons* "employed at wages" in the industries of the kingdom was estimated at about fourteen millions, including over four million women in 1891, and must be at least fifteen and a half millions now. The share of the able-bodied manual workers, in property, then, must average about £29 per head of those in employment.

What sort of a System is this?

Labor politicians, Land Nationalizers, Conservatives, Radicals, all who interest themselves in social science as the study of the well-being of man, will agree with us that

The Use of Land and Capital

should be to serve as instruments for the active, the energetic, the industrious, the intelligent of mankind to produce wealth for themselves and those who are necessarily dependent on them, and to maintain the conditions of healthy existence for the society which they compose. And will they not also agree with us that it is

The Abuse of Land and Capital

that they should be made by the laws of any people a "property" often owned by entirely idle and unprofitable persons, who may exact hire for them from those who are working for the maintenance of social existence, or may even refuse the would-be workers access to these indispensable instruments of industry? For what are the effects?

If the access be refused—land kept out of cultivation; tillage turned into sheepwalks, and sheepwalks into shootings; natural sources of wealth locked up from use; the pleasant places of the earth, the mountains, the moors, the woodlands, the sea shores, parked and preserved and placarded, that the few may have space for their pride, while the many must crowd into squalid cities and dismal agricultural towns, and take their holidays in herds on the few beaten tracks left free for them. In commerce—rings, corners, syndicates, pools, and monopolies, and all the fearful social loss and

* "Eleventh Annual Report of the Labor Department of the Board of Trade," Cd—3690, 1907.

† See "Statistical Abstract," 1907 (Cd—3691).

‡ This figure includes some societies such as the Civil Services Stores, which are not Workmen's Co-operative Societies, though registered as Industrial and Provident Societies under the Friendly Societies Acts.

§ This total is undoubtedly a great deal too large, and much of it is duplicate. Thus, for instance, many of the Building Societies, Trade Unions, Co-operative Societies, Friendly Societies, and Industrial Assurance Societies, bank their surplus funds in the Post Office and the Trustee Savings Banks, and those amounts therefore are in this total counted twice over. Much of it, moreover, is owned by children and others belonging to the middle class.

waste of under-production ; lock-outs, short time, and other expedients of the reckless selfishness of capitalists who are nursing the market for private ends.

If access be granted—if the land and capital be devoted to their proper use, then it is on condition that rent and interest be paid to the proprietor, simply in virtue of his existence as such. He may or may not be doing some work of social utility, but the rent and interest are paid to him as an absolutely idle person, and it is this,

The Tribute of Industry to Idleness,

that Land Nationalizers denounce in its form of rent, and that Socialists, and all who have the Socialist spirit, denounce in all its forms.

With the Land Nationalizers we are at one entirely on this point: That so much of the annual value of land as they class as rent (which is caused by the physical qualities, advantages, or position of land), is a toll taken by an idle class from the industry of the rest of the nation, and should be resumed by the nation in the quickest and most effectual manner possible.

With the non-Socialists we agree entirely on this point: That so much of the income of any landlord as is caused, not by rent as defined by the political economists, but by the exercise of his own abilities as a superintendent and director of agriculture or industry, is of the nature of a salary, the competitive price of useful work done for society. And we further agree with the non-Socialists that so much of the income of any capitalist as is caused, not by interest as defined by the economists, but by the exercise of a similar ability in the administration of capital and the organization of industry, is equally of the nature of a salary obtained by useful work.

We must, however, point out that the monopoly of land and capital has led, and still leads, to a virtual class monopoly of the opportunities of doing this kind of work, and of the education and training required for it ; and that not till these private monopolies are abolished will the remuneration of such activity reach its normal level of competition value. The same monopoly has given to the sons of the privileged classes an advantage which still keeps the wages of certain professions (the Bar, for instance), to which access is guarded by the useless convention of a long and extravagant sham-education, above the level at which they would stand were their opportunities equally open to all.

The Amount of Tribute and its Effects.

Of the tolls enumerated in Sir R. Giffen's table we cannot say what part should be classed as rent and what part as interest ; we can only state that the total income derived from real property—lands and buildings—must amount to about £310,000,000 a year ; and that, according to the table, at least £390,000,000 may be classed as pure interest on other instruments of production (apart from all reward for personal services).*

* See Fabian Tract No. 5, "Facts for Socialists."

The profits and salaries of the class who share in the advantages of the monopoly of the instruments of production, or are endowed by nature with any exceptional ability of high marketable value, amount, according to the best estimate that can be formed, to about £490,000,000 annually. While, out of a national income of some £1,920,000,000 a year, the workers in the manual labor class, four-fifths of the whole population, obtain in wages not more than £730,000,000.*

Rent and interest alone, the obvious tribute of the workers as such to the drones as such, amount demonstrably to almost as much as this sum annually, and it may be safely said that the workers, from top to bottom of society, pay a fine of

One-half the Wealth they Produce

to a parasitic class, before providing for the maintenance of themselves and their proper dependents.

Is a healthy existence secured for society by this arrangement?

The income of the manual labor class may be put at less than £50 per family,† and out of this they must pay heavy rents for the houses they live in. How much is left for healthy life? Even that little is not always vouchsafed to them. There are in London now at least 35,000 adult men who with their families (say 100,000) are slowly starving for want of *regular* employment. Over thirty per cent. of the whole four million inhabitants of the richest city in the world were found by Mr. Charles Booth to fall below his "Poverty Line" of bare subsistence earnings.‡

"At present the average age at death among the nobility, gentry and professional classes in England and Wales is 55 years; but among the artizan classes of Lambeth it only amounts to 29 years; and whilst the infantile death-rate among the well-to-do classes is such that only eight children die in the first year of life out of 100 born, as many as 30 per cent. succumb at that age among the children of the poor in some districts of our large cities. The only real cause of this enormous difference in the position of the rich and poor with respect to their chances of existence lies in the fact that at the bottom of society wages are so low that food and other requisites of health are obtained with too great difficulty." (Dr. C. R. Drysdale, "Report of Industrial Remuneration Conference," p. 130.)

One in three of Londoners dies in the workhouse, hospital, or lunatic asylum; one in six of the manual labor class is a pauper, or has been one.

Hear Professor Huxley (*Nineteenth Century* for February, 1888):

"Anyone who is acquainted with the state of the population of all great industrial centres, whether in this or other countries, is aware that amidst a large and increasing body of that population there reigns supreme . . . that condition which the French call *la misère*, a word for which I do not think there is any exact English equivalent. It is a condition in which the food, warmth, and clothing, which are necessary for the mere maintenance of the functions of the body in their normal state, cannot be obtained; in which men, women, and children are forced to crowd into dens wherein decency is abolished, and the most ordinary conditions of healthful

* See Fabian Tract No. 5, "Facts for Socialists."

† Annual Report of the Labor Department, 1893-4, C—7565.

‡ *Life and Labor of the People*. By Charles Booth. (Macmillan; 1894.)

existence are impossible of attainment; in which the pleasures within reach are reduced to brutality and drunkenness; in which the pains accumulate at compound interest in the shape of starvation, disease, stunted development, and moral degradation; in which the prospect of even steady and honest industry is a life of unsuccessful battling with hunger, rounded by a pauper's grave. . . . When the organization of society, instead of mitigating this tendency, tends to continue and intensify it, when a given social order plainly makes for evil and not for good, men naturally enough begin to think it high time to try a fresh experiment. I take it to be a mere plain truth that throughout industrial Europe there is not a single large manufacturing city which is free from a vast mass of people whose condition is exactly that described, and from a still greater mass, who, living just on the edge of the social swamp, are liable to be precipitated into it."

Land Reform a Partial Remedy Only.

How far would land restoration alone remedy this? If it were possible to nationalize soil apart from capital, the ground rents recovered for the nation might possibly amount to the present sum of our imperial and local taxation, £240,000,000, or thereabouts.* The pecuniary relief certainly could not amount to more. Land nationalization might further immensely benefit society, where it now suffers from the curmudgeonism of private owners. But so long as capital continued to be used for the exploitation of the workers, so long would their economic slavery continue. Those who retain the capital, without which the earth and all its products cannot be worked, will step into the place of the landlord, and the tribute of "interest" will be augmented. Society will be relieved, but not freed.

Objections to Socialism.

But the "practical" objector may ask: Does not the capitalist now administer his capital and direct industry? Was not this admitted above? And is not capital, the product of labor, maintained and augmented by saving? How will Socialists provide for the administration and increase of capital?

"Management."

The question is being answered by the contemporary development of industrial organization. How much of the "management of land" is done now by the landlords, and how much by the farmer and the agent or the bailiff? The landlord's supposed function in this respect is almost entirely performed by salaried professional men. As to capital, who manages it? The shareholders in the joint stock companies, who own nearly five-sixths of the whole industrial capital? No! The shareholding capitalist is a sleeping partner. More and more every day is the capitalist pure and simple, the mere *owner* of the lien for interest, becoming separated from the administrator of capital, as he has long been separated from the wage worker employed therewith. The working partner, with sleeping partner drawing interest, is every day passing into the form of the director of a joint stock company. More and more is the

* "Statistical Abstract of the United Kingdom," Cd—3691, 1907.

management of industries falling into the hands of paid managers, and even the "directors" emphasise the fiction that they are not mere money-bags and decorative M.P.'s by the humorous practice of taking fees for their labors at board meetings.

The administrator of capital can be obtained at present for a salary equivalent to his competition value, whether the concern to be managed be a bank, a railway, a brewery, a mine, a farm, a factory, a theatre, or a hotel. The transfer to the community (national or local) of the ownership of the main masses of industrial capital need make no more difference in this respect than does the sale of shares on the Stock Exchange at the present moment.

"Saving."

As for the *saving* of capital, what does that mean? The artificial instruments of production which form the bulk of property exist certainly only because human labor has been devoted to the production of forms of wealth other than those which are for immediate consumption. Every man in receipt of an income has the option of taking out his claim on the labor of society in the form of immediate enjoyments, passing and perishing in the use, and leaving the world no richer—as luxuries of all kinds, leisure for amusement or travel, service of menials, royal wedding illuminations, beer and skittles, or else in the form of more permanent products or of instruments which can be used for further wealth-production. All that he spends on the latter class of product is said to be saved—and at least one hundred and seventy-five million pounds annually, according to Sir R. Giffen, are "saved" in this way by the creation of new houses, docks, railways, roads, machinery, and other aids to future labor. If a man's income represents the competition value of work done by him, it is said that he has "produced" the amount of saving so made, and has some title to its ownership.

But just as the productive qualities of land are only maintained by the continuous application of human industry, so the most permanent forms of capital are perpetually wasting and being repaired, whilst, of the less durable forms, such as machinery, raw material, and farming stock, the whole is incessantly transformed, consumed, replaced and renewed. The capital saved by the original investor has long since disappeared.

There are, however, very few forms of consumable wealth which can be "saved" at all. Food, clothing, ordinary comforts and luxuries, amusements, and all that makes up our daily life, admit of little storage.

When we say that a man has saved so much wealth, we simply mean that he has abstained from taking out a claim which he had on society, and that its payment is by agreement deferred to the future. But the wealth which is to meet that claim does not at present exist. It is to be produced by the workers, when, where, and in the form asked for.

If we admit the fairness and advantage of guaranteeing to every man the equivalent of the result of his own industry, we should

deny that there is adequate social advantage in a system which permits him to convert this claim into a lien for a perpetual annuity, an enduring tribute from the workers for the use of that which only their using can keep from perishing, while he retains undiminished all the time his claim to the repayment of the original "saving."

The "saving" of capital, the increase of the instruments of production and of permanent commodities by the abstention from consumption of all wealth produced, is undoubtedly an advantage to society. If any individual, for the sake of rendering such advantages to society, abstains in any year from himself consuming all that he has earned, by all means let him be repaid in his old age, or whenever he wants the equivalent of his past activity. Why should we not, as a transitional expedient, treat such economizers as we treat inventors, and if they will not work without such a precise guarantee, if they are still purely individualist in their motive for activity, give them such a reward as we give individualist inventors* in their patent rights, so long as such encouragement is necessary for the creation and interest of our capital. But let that which society has maintained and fructified invariably pass to society within a limited period. So much may be necessary for the present to promote saving out of earned incomes; for saving out of the unearned incomes of rent and interest society can even now take its own measures by taxation for the increase of public capital. As soon as industrial capital is owned by those who use it, provision out of income for all necessary maintenance and increase of the instruments of production will be an ordinary and obvious element in its administration, as it is now in a joint stock company, and our present precarious dependence on the caprice or acquisitiveness of individuals will be superseded.

We appeal, therefore, to Land Nationalizers to consider their reason for hesitating to work with us for the

Nationalization of Capital,

on the ground that the evolution of industry has rendered land and capital indistinguishable and equally indispensable as instruments of production, and that, holding with J. S. Mill that the "deepest root of the evils and iniquities which fill the industrial world is . . . the subjection of labor to capital, and the enormous share which the possessors of the instruments of industry are able to take from the produce,"† we see clearly that if they would make any improvement in the condition of the agricultural laborer and his fellow wage-slave in the towns, they will be forced to abandon the illogical distinctions that are sometimes drawn between the instruments with which they work.

* Non-individualist inventors are those who, like the late Thomas Stevenson (lighthouse engineering), Michael Faraday (industrial chemistry and electricity), Sir William Simpson (anæsthetics), and a host of others, return gratuitously to society the fruits of their inventive genius, and take out no patents.

† Quotation from Feugueray, in *Principles of Political Economy*, p. 477, edn. of 1865.

As instruments of production, the use and value of land and capital alike are due to human labor ; alike they are used for the hindrance or exploitation of industry by their proprietor ; alike they are limited in quantity, and consequently subject to monopoly ; alike they enable a private monopolist to exact tribute from the workers for the use of that which the workers have produced.

The Political Situation.

We appeal to political reformers of all parties to work with us in the spirit which is more and more merging politics in Socialism. However much they may hold aloof from the Land Nationalization movement and resent the imputation of Socialistic tendencies, they have yet been, and still are, and will be, forced to modify our social system in the Socialist direction. What were the Tory Factory Acts, the Truck Acts, the Mines Regulation Acts, the Workmen's Compensation Acts, but limitations of the power of capital ? What are the Adulteration Acts, the Merchant Shipping Acts, the Employers' Liability Acts ? What was the abolition of the Corn Laws ? The *Mark Lane Express* has told us—a confiscation of the "property" of the landlords. What are the Irish Land Acts and the action of the Land Commissioners ? What are the proposals of official Liberals for a "just taxation of land values and ground rents," and "taxation" (apparently not necessarily "just") "of mining royalties,"* and of politicians of both parties for a sliding scale of income tax, but projects for the partial recovery for the nation of the toll which property takes from industry ? What are the Small Holdings and Allotments Acts, but the beginning of provision for the municipalization of land ?

In what respect, then, do the supporters of these measures differ from us on grounds of principle ?

Why are these reformers not Socialists ? Why do they hesitate to join the only party of social reform which has definite principles of action, and a clear vision of the course of economic evolution ? Have they not paved the way by their progressive restrictions of the despotism of the private employer ? And are they not constantly extending the sphere of social industry in the post office, the telegraphs, telephones, tramways, docks, harbors, markets, schools, the supply of gas, water, and electricity, and many other public undertakings ? Are they not steadily increasing the local taxation of realized property, and recovering rent for public use, by the rates on rent for education, parks, free libraries, public baths, and other social conveniences ?

All these are Socialistic measures, that is, they tend either to the recovery of some portion of the tribute which landlord and capitalist now levy, or to the assumption by the community of the control of land and industrial capital. These measures we would multiply by increased taxation, and by the extension of such communal administration, in the hope of leavening the Individualist society in

* National Liberal Federation Resolution, 1891.

which we have to work. Such advances serve as palliatives of existing evils, as educational examples to the slow of understanding, as encouragements to the cautious and conservative. But whether the advance be slow or rapid, this we hold indisputable, that until the workers of this and every other country collectively own and control the instruments they must work with, till then are liberty and manhood impossible for the majority ; and that until we cease to pay to non-effectives the half of our annual sustenance, it will be impossible for the many to obtain that existence and education in youth, that security and leisure in old age, and those opportunities for human and appreciative life, which the resources of our country and our civilization are amply sufficient to yield them.

BASIS OF THE FABIAN SOCIETY.

THE FABIAN SOCIETY consists of Socialists.

It therefore aims at the re-organization of Society by the emancipation of Land and Industrial Capital from individual and class ownership, and the vesting of them in the community for the general benefit. In this way only can the natural and acquired advantages of the country be equitably shared by the whole people.

The Society accordingly works for the extinction of private property in Land and of the consequent individual appropriation, in the form of Rent, of the price paid for permission to use the earth, as well as for the advantages of superior soils and sites.

The Society, further, works for the transfer to the community of the administration of such industrial Capital as can conveniently be managed socially. For, owing to the monopoly of the means of production in the past, industrial inventions and the transformation of surplus income into Capital have mainly enriched the proprietary class, the worker being now dependent on that class for leave to earn a living.

If these measures be carried out, without compensation (though not without such relief to expropriated individuals as may seem fit to the community), Rent and Interest will be added to the reward of labor, the idle class now living on the labor of others will necessarily disappear, and practical equality of opportunity will be maintained by the spontaneous action of economic forces with much less interference with personal liberty than the present system entails.

For the attainment of these ends the Fabian Society looks to the spread of Socialist opinions, and the social and political changes consequent thereon, including the establishment of equal citizenship for men and women. It seeks to achieve these ends by the general dissemination of knowledge as to the relation between the individual and Society in its economic, ethical and political aspects.

THE FABIAN SOCIALIST SERIES

consists of a revised, collected, and classified edition of some of the most valuable of the famous 'Fabian Tracts' in a style more suitable for the general reading public, and supplying in a handy and attractive form the best and most authoritative thought on 'What Socialism Means.' Each booklet contains not less than 96 well-printed pages, good paper and good type, and is supplied in two forms, i.e., in attractive wrappers at 6d. each, nett, and in quarter cloth boards, gilt top, at 1s. each, nett. Postage 1d. and 2d. each respectively.

VOLUMES NOW READY :

- I. **SOCIALISM AND RELIGION.** CONTENTS : (1) Christian Socialism, by the Rev. Stewart D. Headlam. (2) Socialism and Christianity, by the Rev. Percy Dearmer. (3) Socialism and the Teaching of Christ, by the Rev. John Clifford. (4) A Word of Remembrance and Caution to the Rich, by John Woolman, of the Society of Friends.
- II. **SOCIALISM AND AGRICULTURE.** CONTENTS : (1) The Village and the Landlord, by Edward Carpenter. (2) State Aid to Agriculture, by T. S. Dymond. (3) The Secret of Rural Depopulation, by Lieut.-Col. D. C. Pedder. (4) The Revival of Agriculture, by the Fabian Society.
- III. **SOCIALISM AND INDIVIDUALISM.** CONTENTS : (1) The Difficulties of Individualism, by Sidney Webb. (2) The Moral Aspects of Socialism, by Sidney Ball. (3) The Impossibilities of Anarchism, by G. Bernard Shaw. (4) Public Service *versus* Private Expenditure, by Sir Oliver Lodge.
- IV. **THE BASIS AND POLICY OF SOCIALISM.** CONTENTS : (1) Facts for Socialists, by the Fabian Society. (2) Capital and Land, by the Fabian Society. (3) Socialism : True and False, by Sidney Webb. (4) Twentieth Century Politics, by Sidney Webb.

WHAT SOCIALISM IS.

What "Unsocialism" Is.

WE English have a habit of speaking of England as if it belonged to us. We are wrong: England is now private property; and if a laboring man out of employment makes so free with "his country" as to lie down for a night's sleep on it without paying its owners for the accommodation, he is imprisoned as a rogue and a vagabond. The price we must pay rises as the population grows; for the more people there are, the higher they will bid against one another for their dwellings and places of business. In London, for instance, the price paid annually to the ground landlords for the use of the soil alone is £16,000,000; and it goes up by £304,634 every year, without counting the additional charge for new buildings, or repairs and improvements to old ones. After payments of one sort or another to the owners of the whole country have been deducted from the produce of the workers' labor, the balance left for wages is so small, that if every working-class family got an equal share, each share would come to less than £130 a year, which (though it would seem a fortune to many poor people) is not enough for a comfortable living, much less for saving. Nevertheless the proprietary classes, without working at all for it, divide among them enough to give over two hundred thousand rich families more than £1,000 a year, and still leave more than £300 a year per family for over a million and a quarter families of moderately well-off people *in addition to what they make by their professions and businesses.*

The Extreme Cases.

The above figures, bad as they are, only represent averages, and give no idea of the extreme cases of wealth and poverty. Some of our great landowners get upwards of £4,000 a week without ever doing a stroke of work for it; whilst the laborers on their estates, working early and late from the time they are lads until they go into the union as aged and worn-out paupers, get eleven shillings a week. As women get lower wages than men when they work, but receive just as large incomes from property when they are rich and idle, a comparison between the share of our yearly produce that goes to a poor working woman at the East end of London, working sixteen hours a day for a shilling, and the rich, idle lady at the West end, is still more startling. If you doubt these statements, read Fabian Tract No. 5, "Facts for Socialists," in which you will find hundreds of the most terrible figures concerning the misery caused by our present social system, with full references to standard authorities for every one of them.

What Comes of Inequality.

If you are a person of common sense and natural feeling, you must have often thought over these inequalities and their cruel in-

justice. If you are rich, you perhaps think that inequality is a good thing—that it fosters a spirit of emulation, and prevents things from stagnating at a dead level. But if you are poor, you must know well that when inequality is so outrageous as the figures above shew, it fosters nothing but despair, recklessness and drunkenness among the very poor ; arrogance and wastefulness among the very rich ; meanness, envy and snobbery among the middle classes. Poverty means disease and crime, ugliness and brutality, drink and violence, stunted bodies and unenlightened minds. Riches heaped up in idle hands mean flunkeyism and folly, insolence and servility, bad example, false standards of worth, and the destruction of all incentive to useful work in those who are best able to educate themselves for it. Poverty and riches together mean the misuse of our capital and industry for the production of frippery and luxury whilst the nation is rotting for want of good food, thorough instruction, and wholesome clothes and dwellings for the masses. What we want in order to make true progress is more bakers, more schoolmasters, more woolweavers and tailors, and more builders : what we get instead is more footmen, more gamekeepers, more jockeys, and more prostitutes. That is what our newspapers call “sound political economy.” What do you think of it ? Do you intend to do anything to get it remedied ?

No Remedy without Political Change.

The produce of industry has been increased enormously during this last century by machinery, railways, and division of labor. But the first cost of machinery, railways and factories has to be paid out of savings, and not out of the money that people are living on. Now the only people who can spare money to save are those who have more than enough to live on : that is to say, the rich. Consequently the machinery has been introduced, and the factories built out of the savings of the rich ; and as they paid for it (with money made by the labor of the poor), they expect to get all the advantage that comes by using it ; so that here again the workers are left as badly off as ever. The worst of it is that when the rich find how easily they get still richer by saving, they think it is as easy for everybody as for themselves ; and when the worker complains, they say, “Why don’t you save as we do ?” or “How can you expect to be well off if you are not thrifty ?” They forget that though you can save plenty out of £18 a week without stinting your family, you cannot save anything out of eighteen shillings without starving them. Nothing can help the poor except political change from bad social institutions to good ones.

The Three Monopolies.

Moreover the propertied classes, by giving their sons an expensive education, are able to put them into the learned professions and the higher managerial posts in business, over the heads of the wage-workers, who are too poor to get more than the Board School standards for their children. So that out of the price paid for the use of the land, the propertied classes save capital ; and out of the profits of the capital they buy the education which gives to their working members a monopoly of the highly paid employments ; whilst the wage-workers are hopelessly cut out of it all. Here are the figures for the United Kingdom :—

*Income of Propertied Classes (12,000,000 persons)	£1,110,000,000
„ left for Wage-Workers (29,500,000 „)	690,000,000
Total National Income	£1,800,000,000

This means that the rich are masters of the wage-workers, because the whole country is governed by the House of Commons, the County Councils and Municipal Corporations, and only rich men can afford to give their time for nothing to these bodies, or to pay the heavy expenses of getting elected to them. The workman's vote enables him to choose between one rich man and another, but not to fill the Councils and Parliament with men of his own class. Thus the poor keep the rich up ; and the rich keep the poor down ; and it will always be so whilst the land and the machinery from which the nation's subsistence is produced remains in the hands of a class instead of in the hands of the nation as a whole.

What Socialism Is.

Socialism is a plan for securing equal rights and opportunities for all. The Socialists are trying to have the land and machinery gradually "socialized," or made the property of the whole people, in order to do away with idle owners, and to win the whole product for those whose labor produces it. The establishment of Socialism, when once the people are resolved upon it, is not so difficult as might be supposed. If a man wishes to work on his own account, the rent of his place of business, and the interest on the capital needed to start him, can be paid to the County Council of his district just as easily as to the private landlord and capitalist. Factories are already largely regulated by public inspectors, and can be conducted by the local authorities just as gas-works, water-works and tramways are now conducted by them in various towns. Railways and mines, instead of being left to private companies, can be carried on by a department under the central government, as the postal and telegraph services are carried on now. The Income Tax collector who to-day calls for a tax of a few pence in the pound on the income of the idle millionaire, can collect a tax of twenty shillings in the pound on every unearned income in the country if the State so orders. Remember that Parliament, with all its faults, has always governed the country in the interest of the class to which the majority of its members belonged. It governed in the interest of the country gentlemen in the old days when they were in a majority in the House of Commons; it has governed in the interests of the capitalists and employers since they won a majority by the Reform Bill of 1832; and it will govern in the interest of the people when the majority is selected from the wage-earning class. Inquirers will find that Socialism can be brought about in a perfectly constitutional manner, and that none of the practical difficulties which occur to everyone in his first five minutes' consideration of the subject have escaped the attention of those who have worked at it for years. Few now believe Socialism to be impracticable except those with whom the wish is father to the thought.

* This item is made up of six hundred and fifty millions (£650,000,000) which go as Rent and Interest absolutely for nothing, and of four hundred and sixty millions (£460,000,000) incomes of professional men and profits of business management. (See Fabian Tract No. 5, "Facts for Socialists." Ninth edition ; one penny.)

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

PUBLISHED 1892. REPRINT APRIL 1914.

THE FABIAN SOCIETY:

*What it has done;
and
How it has done it.*

IF any delegate present thinks that the Fabian Society was wise from the hour of its birth, let him forthwith renounce that error. The Fabian wisdom, such as it is, has grown out of the Fabian experience; and our distinction, if we may claim any, lies more in our capacity for profiting by experience (a rarer faculty in politics than you might suppose) than in any natural superiority on our part to the follies of incipient Socialism. In 1883 we were content with nothing less than the prompt "reconstruction of society in accordance with the highest moral possibilities." In 1884 we were discussing whether money should be permitted under Socialism, or whether labor notes would not be a more becoming currency for us; and I myself actually debated the point with a Fabian who had elaborated a pass-book system to supersede both methods. Then we were joined by Mrs. Wilson, now one of the chief members of the Freedom Group of Kropotkinist Anarchists; and a sort of influenza of Anarchism soon spread through the society. When we issued our fortunately little-known Tract No. 4, "What Socialism Is," we divided it into two sections, one answering the question from the Collectivist and the other from the Anarchist point of view. The answer did not amount to much either way; for the tract contains nothing that was not already to be found better stated in the famous Communist Manifesto of Marx and Engels.

On the Warpath.

It must not be supposed that Anarchism encountered any resistance among us on the ground of its associations with physical force. The Fabian Society was warlike in its origin: it came into existence through a schism in an earlier society for the peaceful regeneration of the race by the cultivation of perfection of individual character. Certain members of that circle, modestly feeling that the revolution would have to wait an unreasonably long time if postponed until they personally had attained perfection, set up the banner of Socialism

* A paper by G. Bernard Shaw, read at a Conference of the London and Provincial Fabian Societies at Essex Hall on the 6th February, 1892, and ordered to be printed for the information of members.

militant ; seceded from the Regenerators ; and established themselves independently as the Fabian Society. That was how the Fabian began ; and although exactly the same practical vein which had led its founders to insist on an active policy afterwards made them the most resolute opponents of Insurrectionism, the Constitutionalism which now distinguishes us was as unheard-of at the Fabian meetings in 1884 and 1885 as at the demonstrations of the Social-Democratic Federation or the Socialist League. For example, in 1885, a conflict with the Government arose over the right of free speech at Dod Street—a conflict precisely similar to that now [February 1892] on hand at the World's End, Chelsea. But nobody dreamt of giving the Fabian delegate to the Vigilance Committee of 1885 the strict instructions which bind the delegates of 1892 to use all their influence to avert a conflict with the police. He was simply to throw himself into the struggle on the side of the Socialists, and take the consequences. In short, we were for a year or two just as Anarchistic as the Socialist League and just as insurrectionary as the Federation. It will at once be asked why, in that case, we did not join them instead of forming a separate society. Well, the apparent reason was that we were then middle-class all through, rank and file as well as leaders, whereas the League and Federation were quite proletarian in their rank and file. But whatever weight this sort of consideration may have had with our members in general, it had none with our leaders, most of whom, indeed, were active members of the Federation as well. It undoubtedly prevented working-men from joining the Fabian whilst we were holding our meetings in one another's drawing-rooms ; but it did not prevent any Fabian worth counting from joining the working-class organizations. The true cause of the separation lay deeper. Differences, which afterwards became explicit and definite, were latent from the first in the temperament and character of the Fabians. When I myself, on the point of joining the Social-Democratic Federation, changed my mind and joined the Fabian instead, I was guided by no discoverable difference in program or principles, but solely by an instinctive feeling that the Fabian and not the Federation would attract the men of my own bias and intellectual habits who were then ripening for the work that lay before us.

However, as I have said, in 1885 our differences were latent or instinctive ; and we denounced the capitalists as thieves at the Industrial Remuneration Conference, and, among ourselves, talked revolution, anarchism, labor notes *versus* pass-books, and all the rest of it, on the tacit assumption that the object of our campaign, with its watchwords, "EDUCATE, AGITATE, ORGANIZE," was to bring about a tremendous smash-up of existing society, to be succeeded by complete Socialism. And this meant that we had no true practical understanding either of existing society or Socialism. Without being quite definitely aware of this, we yet felt it to a certain extent all along ; for it was at this period that we contracted the invaluable habit of freely laughing at ourselves which has always distinguished

us, and which has saved us from becoming hampered by the gushing enthusiasts who mistake their own emotions for public movements. From the first, such people fled after one glance at us, declaring that we were not serious. Our preference for practical suggestions and criticisms, and our impatience of all general expressions of sympathy with working-class aspirations, not to mention our way of chaffing our opponents in preference to denouncing them as enemies of the human race, repelled from us some warm-hearted and eloquent Socialists, to whom it seemed callous and cynical to be even commonly self-possessed in the presence of the sufferings upon which Socialists make war. But there was far too much equality and personal intimacy among the Fabians to allow of any member presuming to get up and preach at the rest in the fashion which the working-classes still tolerate submissively from their leaders. We knew that a certain sort of oratory was useful for "stoking up" public meetings; but we needed no stoking up, and, when any orator tried the process on us, soon made him understand that he was wasting his time and ours. I, for one, should be very sorry to lower the intellectual standard of the Fabian by making the atmosphere of its public discussions the least bit more congenial to stale declamation than it is at present. If our debates are to be kept wholesome, they cannot be too irreverent or too critical. And the irreverence, which has become traditional with us, comes down from those early days when we often talked such nonsense that we could not help laughing at ourselves.

Tory Gold at the 1885 Election.

When I add that in 1885 we had only 40 members, you will be able to form a sufficient notion of the Fabian Society in its nonage. In that year there occurred an event which developed the latent differences between ourselves and the Social-Democratic Federation. The Federation said then, as it still says, that its policy is founded on a recognition of the existence of a Class War. How far the fact of the working classes being at war with the proprietary classes justifies them in suspending the observance of the ordinary social obligations in dealing with them was never settled; but at that time we were decidedly less scrupulous than we are now in our ideas on the subject; and we all said freely that as gunpowder destroyed the feudal system, so the capitalist system could not long survive the invention of dynamite. Not that we were dynamitards: indeed the absurdity of the inference shows how innocent we were of any practical acquaintance with explosives; but we thought that the statement about gunpowder and feudalism was historically true, and that it would do the capitalists good to remind them of it. Suddenly, however, the Federation made a very startling practical application of the Class War doctrine. They did not blow anybody up; but in the general election of 1885 they ran two candidates in London—Mr. Williams, in Hampstead, who got 27 votes, and Mr. Fielding, in Kennington, who got 32 votes. And they made no secret of the fact

that the expenses of these elections had been paid by one of the established political parties in order to split the vote of the other. From the point of view of the abstract moralist there was nothing to be said against the transaction ; since it was evident that Socialist statesmanship must for a long time to come consist largely of taking advantage of the party dissensions between the Unsocialists. It may easily happen to-morrow that the Liberal party may offer to contribute to the expenses of a Fabian candidate in a hopelessly Tory stronghold, in order to substantiate its pretensions to encourage Labor representation. Under such circumstances it is quite possible that we may say to the Fabian in question, Accept by all means ; and deliver propagandist addresses all over the place. Suppose that the Liberal party offers to bear part of Mr. Sidney Webb's expenses at the forthcoming County Council election at Deptford, as they undoubtedly will, by means of the usual National Liberal Club subscription, in the case of the poorer Labor candidates. Mr. Webb, as a matter of personal preference for an independence which he is fortunately able to afford, will refuse. But suppose Mr. Webb were not in that fortunate position, as some Labor candidates will not be ! It is quite certain that not the smallest odium would attach to the acceptance of a Liberal grant-in-aid. Now the idea that taking Tory money is worse than taking Liberal money is clearly a Liberal party idea and not a Social-Democratic one. In 1885 there was not the slightest excuse for regarding the Tory party as any more hostile to Socialism than the Liberal party ; and Mr. Hyndman's classical quotation, "*Non olet*"—"It does not smell," meaning that there is no difference in the flavor of Tory and Whig gold once it comes into the Socialist treasury, was a sufficient retort to the accusations of moral corruption which were levelled at him. But the Tory money job, as it was called, was none the less a huge mistake in tactics. Before it took place, the Federation loomed large in the imagination of the public and the political parties. This is conclusively proved by the fact that the Tories thought that the Socialists could take enough votes from the Liberals to make it worth while to pay the expenses of two Socialist candidates in London. The day after the election everyone knew that the Socialists were an absolutely negligible quantity there as far as voting power was concerned. They had presented the Tory party with 57 votes, at a cost of about £8 apiece. What was worse, they had shocked London Radicalism, to which Tory money was an utter abomination. It is hard to say which cut the more foolish figure, the Tories who had spent their money for nothing, or the Socialists who had sacrificed their reputation for worse than nothing.

The disaster was so obvious that there was an immediate falling off from the Federation, on the one hand of the sane tacticians of the movement, and on the other of those out-and-out Insurrectionists who repudiated political action altogether, and were only too glad to be able to point to a discreditable instance of it. Two resolutions were passed, one by the Socialist League and the other by the Fabian Society. Here is the Fabian resolution :

"That the conduct of the Council of the Social-Democratic Federation in accepting money from the Tory party in payment of the election expenses of Socialist candidates is calculated to disgrace the Socialist movement in England."—4th Dec., 1885.

Here is the resolution of the League, characteristically non-Fabian in tone :

"That this meeting of London members of the Socialist League views with indignation the action of certain members of the Social Democratic Federation in trafficking with the honor of the Socialist party, and desires to express its sympathies with that section of the body which repudiates the tactics of the disreputable gang concerned in the recent proceedings."—7th Dec., 1885.

The Unemployed Agitation.

From that time forward we were counted by the Federation as a hostile body; and we ourselves knew that we should have to find our way for ourselves without looking to the other bodies for a trustworthy lead. You will perhaps expect to hear that the immediate result was the extinction of the Federation and the advance to the front of the Fabian with its peculiar opportunist policy. But this was not so. Even those members of the Federation who seceded from it then under the leadership of C. L. Fitzgerald and J. Macdonald, never thought of joining the Fabian. They formed in Feb. 1886 a new body called "The Socialist Union," which barely managed to keep breathing for two years. Still, it suited them better than the Fabian. The fact is, 1886 and 1887 were not favorable years for drawing room Socialism and scientific politics. They were years of great distress among the working classes—years for street-corner agitators to marshal columns of hollow-cheeked men with red flags and banners inscribed with Scriptural texts to fashionable churches on Sunday, and to lead desperate deputations from the Holborn Board of Guardians to the Local Government Board office and back again, using stronger language at each official rebuff from pillar to post. These were the days when Mr. Champion told a meeting in London Fields that if the whole propertied class had but one throat he would cut it without a second thought, if by doing so he could redress the injustices of our social system; and when Mr. Hyndman was expelled from his club for declaring on the Thames Embankment that there would be some attention paid to cases of starvation if a rich man were immolated on every pauper's tomb. Besides these London gatherings, there were meetings of the unemployed, not always unaccompanied by window-breaking, in Manchester, Birmingham, Leicester, Yarmouth, and many of the large towns throughout the country. Matters were much the same in Holland and Belgium. In America the Eight Hours Movement, intensified by the distress of the unemployed, who were estimated at a million strong in the United States, led to riots in April 1886,

culminating on the 4th May with the famous Chicago meeting where the bomb was thrown which led to the hanging of four Anarchists. In London the police supervision of the meetings was sufficient to prevent any violence until Monday, 8th February 1886, when a Sugar Bounty meeting was held in Trafalgar Square. It was swamped by a huge crowd of the unemployed. The Federation orators, who were present, seized the opportunity to hold a counter demonstration; after which there was an adjournment to Hyde Park. Unfortunately, on this occasion the police, through some blunder in telephoning or the like, received orders to proceed, not to Pall Mall, but to *The Mall*. Accordingly, they were shivering in St. James's Park whilst the unemployed were passing through the street of rich men's clubs. The rich men crowded to the windows to see the poor men pass along; and Dives, not noticing the absence of the police, mocked Lazarus. Lazarus thereupon broke Dives's windows, and even looted a shop or two, besides harmlessly storming the carriage of a tactless lady near the Achilles statue. Hyndman, Champion, Burns and Williams were arrested and tried for this affair; but there were one or two good men on the jury, notably a Christian Socialist named Crickmay; our friend Sparling was proved by himself and others to have used the most terrible of the phrases for which Burns was indicted; and what with these advantages and the unimpeachable gentility of two of the defendants, all four were acquitted. This was a great success, especially as the Mansion House Fund for the relief of the unemployed had gone up with a bound from £30,000 to £79,000 after the window breaking. The agitation went on more violently than ever afterwards; and the restless activity of Champion, seconded by Burns's formidable oratory, seized on every public opportunity, from the Lord Mayor's Show to services for the poor in Westminster Abbey or St. Paul's, to parade the unemployed and force their claims upon the attention of the public. A commercial firm attempted to make a census of the unemployed in order to advertize themselves; the *Pall Mall Gazette* tried also; and matters looked very gloomy indeed when Champion, impatient of doing nothing but marching hungry men about the streets and making stale speeches to them, offered the Federation the alternative of either empowering him to negotiate some scheme of relief with his aristocratic sympathizers, or else going to Trafalgar Square and staying there day and night until something should happen—the something being perhaps the best available attempt at a revolution possible under the circumstances. The Federation refused both alternatives; and Champion withdrew from the agitation in disgust. A long-brewing dissension between Burns and Hyndman also came to a head about this time; and the result was that the unemployed agitation was left almost leaderless at the moment when the unemployed themselves were getting most desperate. Early in the winter of 1887 the men themselves, under all sorts of casual leaders, or rather speechmakers, took to meeting constantly in Trafalgar Square, thus taking up Champion's alternative for want of anything else to do. Champion, however,

was gone; and the shopkeepers began to complain that the sensational newspaper accounts of the meetings were frightening away their customers and endangering the Christmas quarter's rent. On this the newspapers became more sensational than ever; and those fervid orators who preserve friendly relations with the police began to throw in the usual occasional proposal to set London on fire simultaneously at the Bank, St. Paul's, the House of Commons, the Stock Exchange, and the Tower. This helped to keep the pot boiling; and at last the police cleared the unemployed out of the Square. Immediately the whole working-class political organization of London rallied to the defence of the right of meeting. The affair of 1866, when the railings of Hyde Park were thrown down and the right of meeting there vindicated, and the Free Speech triumph at Dod Street, were precedents in favor of the people. The papers which declared that the workers had an excellent forum in Hyde Park without obstructing Trafalgar Square, were reminded that in 1866 the convenience of Trafalgar Square for public meetings was made an excuse for the attempt to put down meetings in the Park. Mr. Stead, who was then editing the *Pall Mall Gazette*, and who, with all his enthusiasm, had about as much practical knowledge of how to do the Dod Street trick* as a London tram-conductor has of conducting classical concerts, gave the word "To the Square!" To the Square we all went, therefore, with drums beating and banners waving, in our tens of thousands, nominally to protest against the Irish policy of the Government, but really to maintain the right of meeting in the Square. The meeting had been proclaimed; but the authority cited was an Act for the Regulation of Traffic which clearly gave no power to the police to prohibit processions, and which was abandoned by the Government when they had to justify their action in court. However, the new Chief Commissioner of Police, successor to him who had been dismissed for making that mistake in the previous year about Pall Mall, had no notion of sharing his predecessor's fate. He took no half measures in the matter: there was no reading of the Riot Act, or calling on the processions to disperse, as they had arranged to do peacefully and constitutionally if so ordered. It was, as one of Bunyan's pilgrims put it, but a word and a blow with him; for the formal summons to disperse was

* It may be useful to say here that "the way to do the Dod Street trick" is simply to find a dozen or more persons who are willing to get arrested at the rate of one per week by speaking in defiance of the police. In a month or two, the repeated arrests, the crowds which they attract, the scenes which they provoke, the sentences passed by the magistrates and at the sessions, and the consequent newspaper descriptions, rouse sufficient public feeling to force the Home Secretary to give way whenever the police are clearly in the wrong. Mr. Matthews, victorious in Trafalgar Square, has been completely beaten at the World's End, Chelsea, by this method since the above paper was read. The method, however, is extremely hard on the martyrs, who suffer severely, and get no compensation, and but little thanks.

accompanied by a vigorous baton charge, before which the processionists, though outnumbering their assailants by a hundred to one, fled in the utmost confusion and terror. That eventful 13th November 1887 has since been known as "Bloody Sunday." The heroes of it were Burns and Cunninghame Graham, who charged, two strong, at the rampart of policemen round the Square and were overpowered and arrested. The heroine was Mrs. Besant, who may be said without the slightest exaggeration to have all but killed herself with overwork in looking after the prisoners, and organizing on their behalf a "Law and Liberty League" with Mr. Stead. Meanwhile the police received the blessing of Mr. Gladstone; and Insurrectionism, after a two years' innings, vanished from the field and has not since been much heard of. For, in the middle of the revengeful growling over the defeat at the Square, trade revived; the unemployed were absorbed; the *Star* newspaper appeared to let in light and let off steam: in short, the way was clear at last for Fabianism. Do not forget, though, that Insurrectionism will reappear at the next depression of trade as surely as the sun will rise to-morrow morning.*

The Fabian Conference of 1886.

You will now ask to be told what the Fabians had been doing all this time. Well, I think it must be admitted that we were overlooked in the excitements of the unemployed agitation, which had, moreover, caused the Tory money affair to be forgotten. The Fabians were disgracefully backward in open-air speaking. Up to quite a recent date, Graham Wallas, myself, and Mrs. Besant were the only representative open-air speakers in the Society, whereas the Federation speakers, Burns, Hyndman, Andrew Hall, Tom Mann, Champion, Burrows, with the Socialist Leaguers, were at it constantly. On the whole, the Church Parades and the rest were not in our line; and we were not wanted by the men who were organizing them. Our only contribution to the agitation was a report which we printed in 1886, which recommended experiments in tobacco culture, and even hinted at compulsory military service, as means of absorbing some of the unskilled unemployed, but which went carefully into the practical conditions of relief works. Indeed, we are at present trying to produce a new tract on the subject without finding ourselves able to improve very materially on the old one in this respect. It was drawn up by Bland, Hughes, Podmore, Stapelton, and Webb, and was the first of our publications that contained any solid information. Its tone, however, was moderate and its style somewhat conventional; and the Society was still in so hot a temper on the

* This is the sentence which led a London evening newspaper (*The Echo*) to denounce the author in unmeasured terms for inciting the unemployed to armed rebellion. The incident is worth mentioning as an example of the ordinary Press criticism of Socialist utterances.

social question that we refused to adopt it as a regular Fabian tract, and only issued it as a report printed for the information of members. Nevertheless we were coming to our senses rapidly by this time. We signalized our repudiation of political sectarianism in June, 1886, by inviting the Radicals, the Secularists, and anyone else who would come, to a great conference, modelled upon the Industrial Remuneration Conference, and dealing with the Nationalization of Land and Capital. It fully established the fact that we had nothing immediately practical to impart to the Radicals and that they had nothing to impart to us. The proceedings were fully reported for us; but we never had the courage even to read the shorthand writer's report, which still remains in MS. Before I refreshed my memory on the subject the other day, I had a vague notion that the Conference cost a great deal of money; that it did no good whatever; that Mr. Bradlaugh made a speech; that Mrs. Fenwick Miller, who had nothing on earth to do with us, was in the chair during part of the proceedings; and that the most successful paper was by a strange gentleman whom we had taken on trust as a Socialist, but who turned out to be an enthusiast on the subject of building more harbors. I find, however, on looking up the facts, that no less than fifty-three societies sent delegates; that the guarantee fund for expenses was £100; and that the discussions were kept going for three afternoons and three evenings. The Federation boycotted us; but the *Times* reported us. Eighteen papers were read, two of them by members of Parliament, and most of the rest by well-known people. William Morris and Dr. Aveling read papers as delegates from the Socialist League; the National Secular Society sent Mr. Foote and Mr. Robertson, the latter contributing a "Scheme of Taxation" in which he anticipated much of what was subsequently adopted as the Fabian program; Wordsworth Donisthorpe took the field for Anarchism of the type advocated by the authors of "A Plea for Liberty"; Stewart Headlam spoke for Christian Socialism and the Guild of St. Matthew; Dr. Pankhurst dealt with the situation from the earlier Radical point of view; and various Socialist papers were read by Mrs. Besant, Sidney Webb, and Edward Carpenter, besides one by Stuart-Glennie, who subsequently left us because we fought shy of the Marriage Question when revising our "Basis." I mention all this in order to shew you how much more important this abortive Conference looked than the present one. Yet all that can be said for it is that it made us known to the Radical clubs and proved that we were able to manage a conference in a businesslike way. It also, by the way, shewed off our pretty prospectus with the design by Crane at the top, our stylish-looking blood-red invitation cards, and the other little smartnesses on which we then prided ourselves. We used to be plentifully sneered at as fops and armchair Socialists for our attention to these details; but I think it was by no means the least of our merits that we always, as far as our means permitted, tried to make our printed documents as handsome as possible, and did

our best to destroy the association between revolutionary literature and slovenly printing on paper that is nasty without being cheap. One effect of this was that we were supposed to be much richer than we really were, because we generally got better value and a finer show for our money than the other Socialist societies.

The Fabian Parliamentary League.

The Conference was the last of our follies. We had now a very strong Executive Committee, including Mrs. Besant, who in June 1885 had effected her public profession of Socialism by joining the Fabian. Five out of the seven authors of "Fabian Essays," which were of course still unwritten, were at the helm by 1887. But by 1886 we had already found that we were of one mind as to the advisability of setting to work by the ordinary political methods and having done with Anarchism and vague exhortations to Emancipate the Workers. We had several hot debates on the subject with a section of the Socialist League which called itself Anti-State Communist, a name invented by Mr. Joseph Lane of that body. William Morris, who was really a free democrat of the Kropotkin type, backed up Lane, and went for us tooth and nail. Records of our warfare may be found in the volumes of the extinct magazine called *To-Day*, which was then edited by Hubert Bland; and they are by no means bad reading. We soon began to see that at the debates the opposition to us came from members of the Socialist League, who were present only as visitors. The question was, how many followers had our one ascertained Anarchist, Mrs. Wilson, among the silent Fabians. Bland and Mrs. Besant brought this question to an issue on the 17th September, 1886, at a meeting in Anderton's Hotel, by respectively seconding and moving the following resolution :

"That it is advisable that Socialists should organize themselves as a political party for the purpose of transferring into the hands of the whole working community full control over the soil and the means of production, as well as over the production and distribution of wealth."

To this a rider was moved by William Morris as follows :

"But whereas the first duty of Socialists is to educate the people to understand what their present position is, and what their future might be, and to keep the principle of Socialism steadily before them; and whereas no Parliamentary party can exist without compromise and concession, which would hinder that education and obscure those principles, it would be a false step for Socialists to attempt to take part in the Parliamentary contest."

I shall not attempt to describe the debate, in which Morris, Mrs. Wilson, Davis, and Tochatti did battle with Burns, Mrs. Besant, Bland, Shaw, Donald, and Rossiter: that is, with Fabian and S.D.F.

combined. Suffice it to say that the minutes of the meeting close with the following significant note by the secretary :

“Subsequently to the meeting, the secretary received notice from the manager of Anderton’s Hotel that the Society could not be accommodated there for any further meetings.”

Everybody voted, whether Fabian or not ; and Mrs. Besant and Bland carried their resolution by 47 to 19, Morris’s rider being subsequently rejected by 40 to 27.

I must not linger over those high old times, tempting as they are. In order to avoid a breach with the Fabians who sympathized with Mrs. Wilson, we proceeded to form a separate body within the society, called the Fabian Parliamentary League, which any Fabian could join or not as he pleased. I am afraid I must read you at full length the preliminary manifesto of this body. It is dated February, 1887 :

MANIFESTO OF THE FABIAN PARLIAMENTARY LEAGUE.

The Fabian Parliamentary League is composed of Socialists who believe that Socialism may be most quickly and most surely realized by utilizing the political power already possessed by the people. The progress of the Socialist party in the German Reichstag, in the Legislatures of the United States, and in the Paris Municipal Council, not only proves the possibility of a Socialist party in Parliament, but renders it imperative on English Socialists to set energetically about the duty of giving effect in public affairs to the growing influence of Socialist opinion in this country.

The League will endeavor to organize Socialist opinion, and to bring it to bear upon Parliament, municipalities, and other representative bodies ; it will, by lectures and publications, seek to deal with the political questions of the day, analysing the ultimate tendencies of measures as well as their immediate effects, and working for or against proposed measures of social reform according as they tend towards, or away from, the Socialist ideal.

The League will take active part in all general and local elections. Until a fitting opportunity arises for putting forward Socialist candidates to form the nucleus of a Socialist party in Parliament, it will confine itself to supporting those candidates who will go furthest in the direction of Socialism. It will not ally itself absolutely with any political party ; it will jealously avoid being made use of for party purposes ; and it will be guided in its action by the character, record, and pledges of the candidates before the constituencies. In Municipal, School Board, Vestry, and other local elections, the League will, as it finds itself strong enough, run candidates of its own, and by placing trustworthy Socialists on local representative bodies it will endeavor to secure the recognition of the Socialist principle in all the details of local government.

It will be the duty of members of the League, in every borough, to take active part in the public work of their districts ; and to this end they should organize themselves into a Branch of the League. They should appoint a secretary to keep lists of all annual and other elections in his dis-

strict and of all candidates; to attend to the registration of Socialists; to watch the public conduct of all officials, and keep a record thereof for guidance at future elections; to enlist volunteers for special work, and generally to act as a centre of the organization. Individual members should write to their Parliamentary representatives on any Bill on which the League takes action; should take every opportunity of defending and advocating Socialism in their local press; should visit the workhouses of their neighborhood; and should exercise a careful supervision of local funds. By steady work on these and similar lines, Socialists will increase their power in the community, and will before long be able to influence effectively the course of public opinion.

Socialists willing to co-operate should communicate with J. Brailsford Bright, hon. sec. of the Fabian Parliamentary League, 34 Bouverie Street, Fleet Street, E.C., who will give full details as to the method of organizing a Branch of the League.

THE COUNCIL OF THE

February, 1887.

FABIAN PARLIAMENTARY LEAGUE.

RULES OF THE LEAGUE.

1. That the name of the Society be The Fabian Parliamentary League.
2. That the minimum subscription be 2s. 6d. per annum.
3. That at the annual general meeting the Society shall elect a Council, which shall hold office for one year, the secretary or secretaries, and the treasurer being appointed at the same meeting.
4. That each Branch shall appoint a member to serve on the Council.
5. That meetings of the members of the League shall be held at least **once** in every three months, and on such other occasions as the Council shall think necessary.

Here you have the first sketch of the Fabian policy of to-day. The Parliamentary League, however, was a short-lived affair. Mrs. Wilson's followers faded away, either by getting converted or leaving us. Indeed, it is a question with us to this day whether they did **not** owe their existence solely to our own imaginations. Anyhow, it soon became plain that the Society was solidly with the Executive on the subject of political action, and that there was no need for any separate organization at all. The League first faded into a Political Committee of the Society, and then merged silently and painlessly into the general body. During its separate existence it issued two tracts, a criticism of seven Bills then before Parliament, and "The True Radical Programme," which still survives in an up-to-date form as our Tract No. 11, "The Workers' Political Program." One other point about the League must be noted. Mrs. Besant tried to form provincial branches of it; and some such branches did draw breath for a moment here and there in the country. I have not the least idea what became of them, nor is any one present, I venture to say, wiser than I in the matter. This failure was not to be wondered at; for outside Socialist circles

in London the Society remained unknown. It was still unable to bring up its roll of members to a hundred names; and its funds were so modest that nobody ever thought of proposing that we should keep a banking account or rent an office. In fact, we were literally passing rich on £40 a year. There may be among the delegates of the younger Societies represented here, one or two who stand in some awe of the London Society. It may do them good to know that the Birmingham Fabian Society, on the very first day of its existence, was more numerous and more prosperous pecuniarily than the London Society was until quite the other day; and I daresay the same is true of other provincial Fabian bodies. If ever there was a Society which lived by its wits, and by its wits alone, that Society was the Fabian.

Socialism "Equipped with All the Culture of the Age."

By far our most important work at this period was our renewal of that historic and economic equipment of Social-Democracy of which Ferdinand Lassalle boasted, and which had been getting rustier and more obsolete ever since his time and that of his contemporary Karl Marx. In the earlier half of this century, when these two leaders were educated, all the Socialists in Europe were pouncing on Ricardo's demonstration of the tendency of wages to fall to bare subsistence, and on his labor theory of value, believing that they constituted a scientific foundation for Socialism; and the truth is that since that bygone time no Socialist (unless we count Ruskin) had done twopennyworth of economic thinking, or made any attempt to keep us up to date in the scientific world. In 1885 we used to prate about Marx's theory of value and Lassalle's Iron Law of Wages as if it were still 1870. In spite of Henry George, no Socialist seemed to have any working knowledge of the theory of economic rent: its application to skilled labor was so unheard-of that the expression "rent of ability" was received with laughter when the Fabians first introduced it into their lectures and discussions; and as for the modern theory of value, it was scouted as a blasphemy against Marx, with regard to whom the Social-Democratic Federation still maintains a Dogma of Finality and Infallibility which has effectually prevented it from making a single contribution to the economics of Socialism since its foundation. As to history, we had a convenient stock of imposing generalizations about the evolution from slavery to serfdom and from serfdom to free wage labor. We drew our pictures of society with one broad line dividing the bourgeoisie from the proletariat, and declared that there were only two classes really in the country. We gave lightning sketches of the development of the medieval craftsman into the manufacturer and finally into the factory hand. We denounced Malthusianism quite as crudely as the Malthusians advocated it, which is saying a good deal; and we raged against emigration, National Insurance,

Co-operation, Trade-Unionism, old-fashioned Radicalism, and everything else that was not Socialism; and that, too, without knowing at all clearly what we meant by Socialism. The mischief was, not that our generalizations were unsound, but that we had no detailed knowledge of the content of them: we had borrowed them ready-made as articles of faith; and when opponents like Charles Bradlaugh asked us for details we sneered at the demand without being in the least able to comply with it. The real reason why Anarchist and Socialist worked then shoulder to shoulder as comrades and brothers was that neither one nor the other had any definite idea of what he wanted or how it was to be got. All this is true to this day of the raw recruits of the movement, and of some older hands who may be absolved on the ground of invincible ignorance; but it is no longer true of the leaders of the movement in general. In 1887 even the British Association burst out laughing as one man when an elderly representative of Philosophic Radicalism, with the air of one who was uttering the safest of platitudes, accused us of ignorance of political economy; and now not even a Philosophic Radical is to be found to make himself ridiculous in this way. The exemplary eye-opening of Mr. Leonard Courtney by Mr. Sidney Webb lately in the leading English economic review surprised nobody, except perhaps Mr. Courtney himself. The cotton lords of the north would never dream to-day of engaging an economist to confute us with learned pamphlets as their predecessors engaged Nassau Senior in the days of the Ten Hours Bill, because they know that we should be only too glad to advertize our Eight Hours Bill by flattening out any such champion. From 1887 to 1889 we were the recognized bullies and swashbucklers of advanced economics.

How to Train for Public Life.

Now this, as you may imagine, was not done without study; and as that study could not possibly be carried on by the men who were organizing the unemployed agitation in the streets, the Fabians had a monopoly of it. We had to study where we could and how we could. I need not repeat the story of the Hampstead Historic Club, founded by a handful of us to read Marx and Proudhon, and afterwards turned into a systematic history class in which each student took his turn at being professor. My own experience may be taken as typical. For some years I attended the Hampstead Historic Club once a fortnight, and spent a night in the alternate weeks at a private circle of economists which has since blossomed into the British Economic Association—a circle where the social question was left out, and the work kept on abstract scientific lines. I made all my acquaintances think me madder than usual by the pertinacity with which I attended debating societies and haunted all sorts of hole-and-corner debates and public meetings and made speeches at them. I was President of the Local Government Board at an amateur Parliament where a Fabian ministry had to put its proposals into black-and-white in the shape of Parliamentary Bills. Every Sunday

I lectured on some subject which I wanted to teach to myself ; and it was not until I had come to the point of being able to deliver separate lectures, without notes, on Rent, Interest, Profits, Wages, Toryism, Liberalism, Socialism, Communism, Anarchism, Trade-Unionism, Co-operation, Democracy, the Division of Society into Classes, and the Suitability of Human Nature to Systems of Just Distribution, that I was able to handle Social-Democracy as it must be handled before it can be preached in such a way as to present it to every sort of man from his own particular point of view. In old lecture lists of the Society you will find my name down for twelve different lectures or so. Nowadays I have only one, for which the secretary is good enough to invent four or five different names. Sometimes I am asked for one of the old ones, to my great dismay, as I forget all about them ; but I get out of the difficulty by delivering the new one under the old name, which does as well. I do not hesitate to say that all our best lecturers have two or three old lectures at the back of every single point in their best new speeches ; and this means that they have spent a certain number of years plodding away at footling little meetings and dull discussions, doggedly placing these before all private engagements, however tempting. A man's Socialistic acquisitiveness must be keen enough to make him actually prefer spending two or three nights a week in speaking and debating, or in picking up social information even in the most dingy and scrappy way, to going to the theatre, or dancing or drinking, or even sweethearting, if he is to become a really competent propagandist—unless, of course, his daily work is of such a nature as to be in itself a training for political life ; and that, we know, is the case with very few of us indeed. It is at such lecturing and debating work, and on squalid little committees and ridiculous little delegations to conferences of the three tailors of Tooley Street, with perhaps a deputation to the Mayor thrown in once in a blue moon or so, that the ordinary Fabian workman or clerk must qualify for his future seat on the Town Council, the School Board, or perhaps in the Cabinet. It was in that way that Bradlaugh, for instance, graduated from being a boy evangelist to being one of the most formidable debaters in the House of Commons. And the only opponents who have ever held their own against the Fabians in debate have been men like Mr. Levy or Mr. Foote, who learnt in the same school.

Collaring the "Star."

Now let me return from this digression as to how we grounded ourselves in the historic, economic and moral bearings of Socialism, to consider the consequences of our newly acquired proficiency. The first effect was, as we have already seen, to make us conscious that we were neither Anarchists nor Insurrectionists. We demolished Anarchism in the abstract by grinding it between human nature and the theory of economic rent ; and when, driven in disgrace out of Anderton's Hotel, and subsequently out of a chapel near Wardour

Street in which we had taken refuge, we went to Willis's Rooms, the most aristocratic, and also, as it turned out, the cheapest place of meeting in London, our favorite sport was inviting politicians and economists to lecture to us, and then falling on them with all our erudition and debating skill, and making them wish they had never been born. The curious may consult the files of Mr. George Standing's extinct journal, called *The Radical*, for a graphic account, written by an individualist, of the fate of a well-known member of Parliament who was lured into our web on one of these occasions. The article is suggestively entitled, "Butchered to make a Fabian Holiday." We also confuted Co-operation in the person of Mr. Benjamin Jones on a point on which we now see reason to believe that we were entirely in the wrong, and he entirely in the right.

The butchery of the M.P. took place on the 16th March, 1888, four months after the rout at Trafalgar Square. Trade had revived; and with the disappearance of the unemployed the occupation of the Federation was gone. Champion was trying to organize a Labor party with a new paper; Burns, just out of prison for the Square affair, was getting into political harness at Battersea; and the *Star* newspaper was started. We collared the *Star* by a stage-army stratagem, and before the year was out had the assistant editor, Mr. H. W. Massingham, writing as extreme articles as Hyndman had ever written in *Justice*. Before the capitalist proprietors woke up to our game and cleared us out, the competition of the *Star*, which was immensely popular under what I may call the Fabian régime, had encouraged a morning daily, the *Chronicle*, to take up the running; and the *Star*, when it tried to go back, found that it could not do so further than to Gladstonize its party politics. On other questions it remained and remains far more advanced than the wildest Socialist three years before ever hoped to see a capitalist paper. Nowadays even the *Daily News* has its Labor column, although five years ago the editor would as soon have thought of setting aside a column for Freethinkers.

Permeating the Liberals.

However, I must not anticipate. In 1888 we had not been found out even by the *Star*. The Liberal party was too much preoccupied over Mr. O'Brien's breeches and the Parnell Commission, with its dramatic climax in the suicide of the forger Pigott, to suspect that the liveliness of the extreme left of the Radical wing in London meant anything but the usual humbug about working-class interests. We now adopted a policy which snapped the last tie between our methods and the sectarianism of the Federation. We urged our members to join the Liberal and Radical Associations of their districts, or, if they preferred it, the Conservative Associations. We told them to become members of the nearest Radical Club and Co-operative Store, and to get delegated to the Metropolitan Radical Federation and the Liberal and Radical Union if possible. On these bodies we made speeches and moved resolutions, or, better still, got

the Parliamentary candidate for the constituency to move them, and secured reports and encouraging little articles for him in the *Star*. We permeated the party organizations and pulled all the wires we could lay our hands on with our utmost adroitness and energy; and we succeeded so far that in 1888 we gained the solid advantage of a Progressive majority, full of ideas that would never have come into their heads had not the Fabian put them there, on the first London County Council. The generalship of this movement was undertaken chiefly by Sidney Webb, who played such bewildering conjuring tricks with the Liberal thimbles and the Fabian peas, that to this day both the Liberals and the sectarian Socialists stand aghast at him. It was exciting whilst it lasted, all this "permeation of the Liberal party," as it was called; and no person with the smallest political intelligence is likely to deny that it made a foothold for us in the press and pushed forward Socialism in municipal politics to an extent which can only be appreciated by those who remember how things stood before our campaign. When we published "Fabian Essays" at the end of 1889, having ventured with great misgiving on a subscription edition of a thousand, it went off like smoke; and our cheap edition brought up the circulation to about twenty thousand. In the meantime we had been cramming the public with information in tracts, on the model of our earliest financial success in that department, namely, "Facts for Socialists," the first edition of which actually brought us a profit—the only instance of the kind then known. In short, the years 1888, 1889, 1890 saw a Fabian boom, the reverberation of which in the provinces at last produced the local Fabian societies which are represented here to-night. And I now come to the most important part of this paper; for I must at once tell you that we are here, not to congratulate ourselves on the continuance of that boom, but to face the fact that it is over, and that the time has come for a new departure.

One day, about a year ago, a certain "Liberal and Radical" London member of Parliament, having been coaxed by Webb to the point of admitting that his aims were exactly those of the Socialists, namely, the extinction of incomes derived from privately appropriated rent and interest, and that it was therefore his high destiny to lead the working-classes along the path of progress, was asked to get to business. Thereupon he made the discovery that he was not a Socialist and that Webb was. The intelligence spread with remarkable rapidity to all the official Liberals who had been reached by the Fabian influence; and the word was promptly given to close up the ranks of Capitalism against the insidious invaders. As in the case of the *Star* newspaper, the discovery came too late. It is only necessary to compare the Nottingham program of the National Liberal Federation for 1887 with the Newcastle program for 1891, or to study the Liberal and Radical Union program for the 1892 London County Council election, to appreciate the extent to which the policy of permeating the party organizations with Socialism had succeeded. The official leaders of the Liberal party cannot now turn

their followers back : they can only refuse to lead them and sit as tight as they can under the circumstances. The Radicals are at last conscious that the leaders are obstructing them ; and they are now looking for a lead in attacking the obstruction. They say to us, in effect, “ Your policy of permeating has been successful : we *are* permeated ; and the result is that we find all the money and all the official power of our leaders, who are not permeated and cannot be permeated, arrayed against us. Now shew us how to get rid of those leaders or to fight them.” I want to impress this situation on you, because there are some Rip Van Winkles in our movement who are only now waking up to the special variety of permeating work which was begun in 1886 and finished in 1890, and who, now that it is over and done with as far as the London Fabian is concerned, are protesting loudly against its being begun. No doubt there still remains, in London as everywhere else, a vast mass of political raw material, calling itself Liberal, Radical, Tory, Labor, and what not, or even not calling itself anything at all, which is ready to take the Fabian stamp if it is adroitly and politely pressed down on it. There are thousands of thoroughly Socialized Radicals to-day who would have resisted Socialism fiercely if it had been forced on them with taunts, threats, and demands that they should recant all their old professions and commit what they regard as an act of political apostasy. And there are thousands more, not yet Socialized, who must be dealt with in the same manner. But whilst our propaganda is thus still chiefly a matter of permeation, that game is played out in our politics. As long ago as 1889 we plainly said, in the last Fabian Essay—Bland’s “ Political Outlook ”—that the moment the party leaders realized what we were driving at, they would rally round all the institutions we were attacking, even at the cost of coalescing with their rivals for office, unless they could put us off more cheaply by raising false issues such as Leaseholds Enfranchisement, Disestablishment of the Church, or bogus “ endings or mendings ” of their cherished bulwark the House of Lords. We now feel that we have brought up all the political laggards and pushed their parties as far as they can be pushed, and that we have therefore cleared the way to the beginning of the special political work of the Socialist—that of forming a Collectivist party of those who have more to gain than to lose by Collectivism, solidly arrayed against those who have more to lose than to gain by it. That is the real subject of this Conference. Whether the time is ripe now or not, to that it must come at last ; for even the most patient Fabians are growing anxious to make their position clear and to escape from the suspicion of being a mere left wing of the party which rallies round Messrs. Bryant & May’s statue to Mr. Gladstone. We are especially loth to let the forthcoming general election pass without making it known that the eight years’ work which I am sketching for you in this paper was not done for the sake of the sweaters and place-hunters who will presently be claiming the credit of it at the polls. Not that we would hesitate to let the credit go for the moment to any quarter, however venal, from which we could get a fair return

in substantial concessions to our cause; but in this instance we believe that our natural inclinations and our political interests point to the same course, that of making it understood that Fabianism is neither official Liberalism nor official Toryism, but an intelligent Collectivism that will eventually wear down both.

The Tactics of the Social - Democratic Federation.

And now, some of you will be inclined to ask whether this does not mean that we have at last come round to the views of the Social-Democratic Federation? The reply is that our *views* have always been the same as those of that body. On the 29th February, 1884, Mr. Bland moved at a Fabian meeting the following resolution:

“That whilst not entirely agreeing with all the statements and phrases used in the pamphlets of the Democratic Federation and in the speeches of Mr. Hyndman, this Society considers that the Democratic Federation is doing a good and useful work and is worthy of sympathy and support.”

That was carried *nem. con.*; and it would no doubt be carried unanimously here this evening if Mr. Bland were to move it again. But we did not proceed to amalgamate with them in 1884 any more than we shall to-night. Our organization and our methods are radically different; and the experience of the past eight years has strengthened our preference for our own and confirmed our objection to theirs. Let me enumerate a few of the differences. In the first place, the Fabian Society is a society for helping to bring about the Socialization of the industrial resources of the country. The Social-Democratic Federation is a society for enlisting the whole proletariat of the country in its own ranks and itself Socializing the national industry. The Federation persistently claims to be the only genuine representative of working-class interests in England. It counts no man a Socialist until he has joined it, and supports no candidate who is not a member. If one of its speakers supports an outside candidate, he is disowned. Only the other day the Executive Council of the Federation proposed that no member should even vote for any candidate not enrolled in its ranks.* The Federation chooses its own candidates without consulting its neighbors, and sends them to the poll, when it has the money, without the slightest regard to the possibility of such a course making a present of the seat to the least Socialistic candidate in the field. This implacably sectarian policy evidently depends for its success on the recruiting powers of the Society which adopts it. It was planned in the days when we all believed that Socialism had only to be explained to the working-classes to bring every working-

* This policy was finally adopted, and promulgated in the S.D.F. Manifesto issued on the occasion of the General Election in June-July, 1892. See, however the postscript to this tract.

man, not only in England but in Europe—nay, in the world—into our ranks. It would clearly be the right policy if four out of every five men in England were members of the Social-Democratic Federation. But the experience of over half a century of agitation has proved that no such result is possible. The Federation, in every centre of the population where it exists, is practically as insignificant a minority as the Fabian. The ablest working-class agitators it ever produced, John Burns and Tom Mann, had to free themselves from it the moment they gained sufficient political experience to see that a united nation of subscribers to the Social-Democratic Federation can never be anything more than a dream. A necessary part of the Federation policy is the denunciation, as misleaders of the people, of Radicals, Co-operators, Teetotallers, Trade-Unionists, Fabians, and all rival propagandists. The result of this is that the Federation branches are not merely insignificant in numbers, but unpopular as well, in spite of the admittedly stimulating effect of their meetings on the political activity of the working class. Their hand being against every outsider, every outsider's hand is naturally against them; and as the outsiders outnumber them by more than a thousand to one, they cannot get any real influence among the men who really manage the political work and organization of the working-classes, and who are of course all Co-operators, Teetotallers, Trade Unionists, or party men of one kind or another. For it is only your middle-class enthusiast who comes into the movement by reading Mazzini or Marx, without any previous experience in the only sort of organization hitherto open to working men of any organizing capacity. The net result is that wherever the Federation can shew a fair degree of success in branch work, it will be found that the branches have modified their policy in the Fabian direction. In Battersea, for instance, they were only masters of the situation whilst they followed John Burns, who, like Tom Mann, is insanely denounced by the central council as a mercenary renegade, and who, in return, makes no secret of his unbounded contempt for Federation tactics. At Manchester, too, where the Federation has had a creditable success, the branch practically repudiates the central authority by maintaining harmonious relations with the new Unionism which Burns inaugurated down at the docks here. In London the Federation would be a cipher but for the fact that it has stopped short of boycotting the Trades Council, on which it is strongly represented.

Fabian Tactics.

Now let us look at the Fabian tactics. We have never indulged in any visions of a Fabian army any bigger than a stage army. In London we have never publicly recruited except for other bodies. When I lecture for the Federation, I do not invite workmen to join the Fabian, but to join the branch for which I am lecturing. So far are we from encouraging the rush of members that has lately come

upon us, that we have actually tried to check it by insisting on stricter guarantees of the sincerity of the applicants' acceptance of our basis ; and I do not hesitate to say that if it were not for the need of spreading the cost of our work over as large a number of subscribers as possible, we should be tempted to propose the limitation of our society in London to a hundred picked members. We have never advanced the smallest pretension to represent the working-classes of this country. No such absurdity as a candidate nominated by the Fabian Society alone has ever appeared in London, though we flatter ourselves that a candidate finds it no disadvantage now to be a Fabian. Although we think we can see further ahead than the mere Trade-Unionist or Co-operator, we are ready to help them loyally to take the next step ahead that lies in their path. When we go to a Radical Club to inveigh against the monopolies of land and capital, we know perfectly that we are preaching no new doctrine, and that the old hands were listening to such denunciations twenty-five years before we were born, and are only curious to know whether we have anything new in the way of a practical remedy. In short, we know that for a long time to come we can only make headway by gaining the confidence of masses of men outside our Society who will have nothing to do with us unless we first prove ourselves safe for all sorts of progressive work. For this we are denounced by the Social-Democratic Federation as compromisers of our principles, Liberal wire-pullers, and sham middle-class Socialists of the gas-and-water variety.

Again, consider our relation to the local Societies. Unlike the Federation branches, these are so perfectly independent of our control or dictation, that one of them has already tried Federation tactics at the School Board election, with the result that its candidates were thoroughly beaten and the Society effectually discredited. We insisted on this independence ourselves, seeing the advantage of each Society being able to appeal for support as an independent and autonomous local body, not committed in any way to the proceedings of people in London on whom they could have no effective check, and yet sharing the prestige and freedom from insurrectionary associations of the Fabian name. Suppose we reversed this policy, and made the whole set of Fabian Societies into a Fabian Federation on the S.D.F. plan. They would all become the slaves of a council here in London on which they could not be represented. For though they would be entitled to have delegates on it, yet as they could not afford to pay the expenses of these delegates up and down for every council meeting, they would have to fall back on the S.D.F. or Trade-Union plan of asking London members to represent them, which would produce that worst form of pseudo-democratic slavery which consists in the appearance of representation without the reality of it.

Take another point. The Federation runs a newspaper called *Justice*, which has not hitherto been worth a penny to any man whose pence are so scarce as a laborer's, and which has made repeated attacks on the ordinary working-class organizations without whose co-operation Socialists can at present do nothing except cry in

the wilderness. The branches are expected to sell this paper at their meetings. Now I hope no Fabian tract at present in the market is worth less than a penny, or is calculated to give needless offence to any of our allies. As to a paper, we recognize that a workman expects for his penny a week a newspaper as big and as full of general news as any of the regular Sunday papers. Therefore our policy has been to try to induce some of these regular papers to give a column or two to Socialism, calling it by what name they please. And I have no hesitation in saying that the effect of this policy as shewn in the *Manchester Sunday Chronicle*, the *Star*, the *London Daily Chronicle*, and other more exclusively working-class papers, notably *The Clarion*, has done more for the cause than all the time and money that has been wasted on *Justice* since the *Star* was founded. *Fabian News* does everything for us that *Justice* does for the Federation; but what would you think of us if we invited you to offer it for a penny to the man in the street as the leading organ of Social-Democracy in England? Our mission is to Socialize the Press as we hope to Socialize Parliament and the other Estates of the realm, not to run the Press ourselves.

Finally, how has the Federation policy succeeded as a means of maintaining discipline and solidarity in its own ranks? Evidently not at all. First came the secession of the Socialist League, in which they lost their greatest man, William Morris, besides Andreas Scheu, Belfort Bax, the late C. J. Faulkner, Robert Banner, E. T. Craig (of Ralahine fame), Bland, Aveling, Mrs. Marx-Aveling, and others. But they retained Helen Taylor, John Burns, Champion, and Tom Mann. Not one of these remain with them. Now look at the Fabian record. Our first regular Executive Council was that appointed to serve from January 1885 to April 1886. The names are Pease, Bland, Shaw, Webb, and Mrs. Wilson. To them we added Mrs. Besant and Podmore in 1886, Olivier and Phillips in 1887, Graham Wallas and William Clarke in 1888. Look at the Executive of to-day, and you find Webb, Bland, Shaw, Pease, Olivier and Wallas there still; and you would find Podmore, Phillips and Clarke but for the fact that they voluntarily withdrew in favor of members who were better able to attend the Executive meetings. They are still available whenever they are called upon. Mrs. Wilson is the only one whom we have lost through any political incompatibility; for Mrs. Besant's loss is a grief which we share with all the advanced societies in London except the Theosophic Society. We are a regular old gang. But if you consider that we are all persons of tolerably strong individuality, and very diverse temperaments, and take that along with the fact that no one of us is strong enough to impose his will on the rest, or weak enough to allow himself to be overridden, you will, I think, allow me to claim our escape from the quarrels which rent asunder both the Federation and the League as a proof that our methods stand the test of experience in the matter of keeping our forces together.

In saying all this, I have had to be a little hard on the S.D.F., the rank and file of which are for the most part our very good friends,

as they shew by the freedom with which they help us and invite us to help them in any convenient way without the slightest regard to the denunciations of us in which *Justice* periodically indulges. On our side we take no offence and bear no grudge, knowing too well how often our success has been made easy by their exertions in breaking ground for us. But I think you will now see that it is impossible for us ever to amalgamate with the Social-Democratic Federation whilst it remains a federation, or to recommend any of our local Societies to venture on such a step. If such an amalgamation ever takes place, it will come about by branches of the Federation from time to time throwing off the leading strings of that body and combining with the other Socialists of the town, including the Fabians, to form a local independent Socialist Society.

Scientific Class Warfare.

But however we may combine or divide our forces, our tactics must always depend on our strength at the moment. At present it is good tactics for the United States to bully Chili ; but it would be bad tactics for Portugal to bully England. It is good tactics to run a Labor candidate at Battersea : it would be folly to run one at Hampstead. If the numbers of the Fabian Society in any constituency ever rise to the point of making the result of the election depend on the Fabian vote, that Society will not only run Fabian candidates, but will run them with a highhandedness that will astonish even the Federation. It may be said, roughly, that the tactics of the Fabian Society will change with every additional thousand of its members. Only, remember, the addition must be a real addition. Our rolls of membership must not be padded with the names of dead-heads who join in a fit of short-lived enthusiasm, and drop off after three weeks. In London we have always kept up a system of periodical purging so as to make our roll represent our real strength. If a member disappears for any length of time, or ceases to subscribe, he is asked whether he has changed his mind, and is struck off if his reply is not satisfactory. Thus our first rule is not to try and deceive ourselves as to our power. I will not pretend that we are always as scrupulous in the matter of enlightening other people. Though we have never deceived the public by overstating our numbers, we have not always insisted on undeceiving them when they shewed a disposition to make concessions to us which they would perhaps have thought twice about if their notions of our bulk had been derived from our official records instead of from their imaginations. But in politics as in the game of poker, bluffing belongs only to the early days of the game. The moment you go to the poll, all concealment is at an end. When the Social-Democratic Federation consisted of about forty members, the *Church Review* estimated them at about 4,000 ; and it was possible then to laugh at the *Church Review* with an air which conveyed to the superstitious that 40,000 would have been nearer the mark. But after 1885 there was an end of that,

just as there will be an end, after the coming general election, of all romantic notions about the influence of the Fabian. In 1888 it only cost us twenty-eight postcards written by twenty-eight members to convince the newly-born *Star* newspaper that London was aflame with Fabian Socialism. In 1893 twenty-eight dozen postcards will not frighten the greenest editor in London into giving us credit for an ounce over our real weight. The School Board election has robbed us of half our imaginary terrors; the County Council election may take away the rest; the General election will finish the bluffing element in our tactics for ever.* No more unearned increment of prestige for us then; for though rumor may count us at two hundred to the score, the returning-officer will count us strictly at twelve to the dozen, and publish the results where everyone will read them. Thenceforth we shall play with our cards on the table. Our business will then be, not to talk crudely about the Class War, with very cloudy notions as to the positions of the two camps and the uniforms of the two armies (both of which, by-the-bye, will sport red flags), but to organize it scientifically so that we shall drain the opposite host of every combatant whose interests really lie with ours. The day has gone by for adopting Fergus O'Connor's favorite test of the unshaven chin, the horny hand, and the fustian jacket as the true distinctive mark of the soldier of liberty. Nor will the Trade-Unionist test of having at some time done manual work for weekly wages serve us. Such distinctions date from the days when even the ability to read and write was so scarce, and commanded so high a price both in money and social status, that the educated man belonged economically to the classes and not to the masses. Nowadays the Board Schools have changed all that. The commercial clerk, with his reading, his writing, his arithmetic and his shorthand, is a proletarian, and a very miserable proletarian, only needing to be awakened from his poor little superstition of shabby gentility to take his vote from the Tories and hand it over to us. The small tradesmen and rate-payers who are now allying themselves with the Duke of Westminster in a desperate and unavailing struggle against the rising rates entailed by the eight hours day and standard wages for all public servants, besides great extensions of corporate activity in providing accommodation and education at the public expense, must sooner or later see that their interest lies in making common cause with the workers to throw the burden of taxation directly on to unearned incomes, and to secure for capable organizers of industry the prestige, the pensions, and the permanence and freedom from anxiety and competition which municipal employment offers. The professional men of no more than ordinary ability, struggling with one another for work in

* This anticipation has fortunately not been justified by the event. Six members of the Fabian Society are now members of the County Council; and it is not too much to claim that the result of the General Election upset every estimate of the political situation except the Fabian one. See the preface to the 1892 edition of Fabian Tract No. 11, "The Workers' Political Program."

the overstocked professions, are already becoming far more tired of Unsocialism and Competition than the dock laborers are, because revivals of trade bring them no intervals of what they consider good times. In short, all men except those who possess either exceptional ability or property which brings them in a considerable unearned income, or both, stand to lose instead of to win by Unsocialism; and sooner or later they must find this out and throw in their lot with us. Therefore to exclude middle-class and professional men from our ranks is not "scientific Socialism" at all, but the stupidest sort of class prejudice. It would be far more sensible to exclude those skilled artisans who make several pounds a week; work overtime with reckless selfishness; and have even been known to refuse to employ laborers belonging to unions. But there is no need to exclude anybody. The real danger is that since we are certain to have an increasing number of professional men, tradesmen, clerks, journalists and the like in our ranks, these men may by their superior education, or rather their superior literateness—which is not exactly the same thing—and by their more polished manners, be chosen too often as candidates at elections and as committee-men. This would be a most fatal mistake; for it is of the first importance that all our candidates and executive council-men should be the ablest men in the movement, whereas the presumption must always be that our recruits from the professions and from business would not have joined us if they had not lacked the exceptional energy and practical turn which still enable men to make fortunes, or at least very comfortable incomes, in those classes. To become a Fabian agitator would hardly be looked on as promotion by Sir Charles Russell, or Mr. Whiteley, or the President of the Royal Academy, or a physician or dentist earning £1,500 a year. Speaking for myself as a professional man, claiming to be able to do a somewhat special class of work, I may say that the more my ability becomes known, the more do I find myself pressed to spend my time in shovelling guineas into my pocket instead of writing Fabian papers, attending to the Fabian Executive work, lecturing, revising or compiling tracts, and writing papers like the present. My case is a typical one; and it shews that if the working-classes run after middle-class men as representatives, they will have to choose between pecuniarily disinterested men and men who are discontented because they are not clever enough to get their fill of work or money in their professions or businesses. Now, though every clever and warmhearted young gentleman bachelor enjoys from two to ten years of disinterestedness, during which good work can be got from him, yet in the long run he gets tired of being disinterested. *Permanently* disinterested men of ability are very scarce: it is easier to find a thousand men who will sacrifice valuable chances in life once than to find a single man who will do it twice. And average duffers, though plentiful, are not to be trusted with the generalship of so great a campaign as ours. Consequently, the workers should make it a rule always to choose one of their own class as a candidate or councilman, except when the middle-class candidate has given special proofs

of his ability and disinterestedness. This is why I myself have so often urged working-class audiences to believe in themselves and not run after the tall hats and frock coats. It is only the clever wage-workman to whom political leadership in the workman's cause comes as a promotion.

My task, I am happy to say, is now done. You know what we have gone through, and what you will probably have to go through. You know why we believe that the middle-classes will have their share in bringing about Socialism, and why we do not hold aloof from Radicalism, Trade-Unionism, or any of the movements which are traditionally individualistic. You know, too, that none of you can more ardently desire the formation of a genuine Collectivist political party, distinct from Conservative and Liberal alike, than we do. But I hope you also know that there is not the slightest use in merely expressing your aspirations unless you can give us some voting power to back them, and that your business in the provinces is, in one phrase, to create that voting power. Whilst our backers at the polls are counted by tens, we must continue to crawl and drudge and lecture as best we can. When they are counted by hundreds we can permeate and trim and compromise. When they rise to tens of thousands we shall take the field as an independent party. Give us hundreds of thousands, as you can if you try hard enough, and we will ride the whirlwind and direct the storm.

POSTSCRIPT.

The lapse of time between the reading of the above paper and its publication, makes it necessary, in justice to the Social-Democratic Federation, to add a few words. The explanation of the delay is very simple: a glance back at pages 5 and 6 will shew that their publication on the eve of the General Election might have injured the prospects of the two Federation candidates who were in the field. The close of the polls has not only set the Fabian Society free to issue this tract; it has also apparently convinced the S.D.F. of the practically reactionary effect of its sectarian tactics. The victory of Mr. Dadabhai Naoroji, the official Liberal candidate for Central Finsbury, who won by a majority of three only, was secured by the votes of the Clerkenwell branch of the S.D.F., which very sensibly threw off its allegiance to the central council and "went Fabian" for the occasion in flat defiance of the S.D.F. manifesto calling on the workers to vote for none but Social-Democratic candidates. Instead of a sentence of excommunication, there came from headquarters the following utterance in *Justice* (No. 444, 16th July, 1892), presumably from the pen of Mr. Belfort Bax, who was then acting as editor.

PRINCIPLES AND THEIR APPLICATION.

Talking about Naoroji affords us an opportunity of seconding the point mentioned in the letter above referred to, namely, as to the desirability on special occasions of relaxing the generally excellent principle of not voting or working for either side. The laxity we complained of last week which is shown by members of the S.D.F. who got the "election fever" in throwing themselves indiscriminately into the struggle on the Radical side irrespective of the programme or the candidate is undoubtedly due to the slightly pedantic attitude sometimes taken up on this point. Now the pollings are over we do not hesitate to say that we think that the *non possumus* rule should have been relaxed in the North Lambeth election for the purpose of keeping Stanley out, and thereby checkmating the designs of the British East Africa Company, even at the expense of assisting a colorless Radical nonentity to obtain the seat; and also in Central Finsbury, both as a demonstration against the conduct of official Liberalism and for the sake of getting a friendly outsider the chance of bringing the claims of the people of India for the first time prominently before the larger British public. If you give a Social Democrat some, at least more

or less, useful work in an election, you keep him out of the mischief of squandering his time in promiscuous assistance to worthless Liberals. For it is not given to every man during the excitement of election times to be able to twirl his thumbs and repeat the obvious Socialist truism that one political party is as bad as the other, as the Moslem reiterates the well-worn and doubtless to him equally certain dictum, "Allah is great." There may be a zeal of principle, "but not with discretion." We take it there is no compromise in a momentary alliance with any party for the purpose of carrying an important point. This is a very different thing from the principle of "permeation" advocated by the Fabians.

The recantation in the last sentence but one is complete. The last sentence means only that since *Justice* has given the Fabian dog a bad name, it feels bound to go on hanging him in spite of its tardy discovery of his good qualities.

I do not know whether this declaration of Opportunism is anything more than a passing excuse for the action of the insurgent branch. It would, however, be clearly unfair to allow pages 21 and 22 to become public without mentioning it.

July, 1892.

G. B. S.

BASIS OF THE FABIAN SOCIETY.

THE FABIAN SOCIETY consists of Socialists.

It therefore aims at the re-organization of Society by the emancipation of Land and Industrial Capital from individual and class ownership, and the vesting of them in the community for the general benefit. In this way only can the natural and acquired advantages of the country be equitably shared by the whole people.

The Society accordingly works for the extinction of private property in Land and of the consequent individual appropriation, in the form of Rent, of the price paid for permission to use the earth, as well as for the advantages of superior soils and sites.

The Society, further, works for the transfer to the community of the administration of such industrial Capital as can conveniently be managed socially. For, owing to the monopoly of the means of production in the past, industrial inventions and the transformation of surplus income into Capital have mainly enriched the proprietary class, the worker being now dependent on that class for leave to earn a living.

If these measures be carried out, without compensation (though not without such relief to expropriated individuals as may seem fit to the community), Rent and Interest will be added to the reward of labor, the idle class now living on the labor of others will necessarily disappear, and practical equality of opportunity will be maintained by the spontaneous action of economic forces with much less interference with personal liberty than the present system entails.

For the attainment of these ends the Fabian Society looks to the spread of Socialist opinions, and the social and political changes consequent thereon, including the establishment of equal citizenship for men and women. It seeks to achieve these ends by the general dissemination of knowledge as to the relation between the individual and Society in its economic, ethical and political aspects.

The work of the Fabian Society takes, at present, the following forms :—

1. Meetings for the discussion of questions connected with Socialism.
2. The further investigation of economic problems, and the collection of facts contributing to their elucidation.
3. The issue of publications containing information on social questions, and arguments relating to Socialism.
4. The promotion of Socialist lectures and debates in other Societies and Clubs.
5. The representation of the Society in public conferences and discussions on social questions.

The members are pledged to take part according to their abilities and opportunities in the general work of the Society, and are expected to contribute annually to the Society's funds.

The Society seeks recruits from all ranks, believing that not only those who suffer from the present system, but also many who are themselves enriched by it, recognize its evils and would welcome a remedy.

The Society meets for lectures and discussions on two Fridays in the month, at 8 p.m.

Christian Socialism.

LONG before the Fabian Society was founded I learnt the principles and was familiar with the title of "Christian Socialism" from Maurice and Kingsley, the Professors of Philosophy and History at Cambridge.

There were those then, as there are those now, who object both to the title and to the principles it expresses: the connection of the adjective "Christian" with the noun "Socialism" seems to them out of place. And the reason for this is, that for long both earnest Christians and those who have equally earnestly opposed the Christian religion, have been in the habit of thinking and talking as if "other-worldliness" was the note of a true Christian—as if his main object should be to get to Heaven after death. Whereas, on the contrary, so far at any rate as the teaching of Jesus Christ Himself is concerned, you will find that He said hardly anything at all about life after death, but a great deal about the Kingdom of Heaven, or the righteous society to be established on earth. And as the whole of what I have to say to you depends on the truth of this, I must ask you to allow me to elaborate it to you a little at length.

Take, first of all, that long series of works of Christ's which are generally now called "miracles," but which St. John, at any rate, used to call "signs," significant acts shewing what kind of a person Christ was, and what He wished His followers to be; and you will find—without troubling for the moment how they were done, but merely considering what all those who believe they happened are bound to learn from them—that they were all distinctly secular, socialistic works: works for health against disease, works restoring beauty and harmony and pleasure where there had been ugliness and discord and misery; works taking care to see that the people were properly fed, works subduing nature to the human good, works shewing that mirth and joy have a true place in our life here, works also shewing that premature death has no right here. In fact, if you want to point the contrast between Christ and modern Christians, you cannot do better than consider the different way in which He and they speak about premature death. They are in the habit of saying, when their children die, after their first grief is over: "Oh, it is well with them—they have gone to a better place"; but Christ, so far from encouraging that kind of talk, deliberately, according to the stories which all Christians believe to be true, took pains to bring back into this beautiful world those who had passed off it before the time. The death of an old man, passing away in his sleep, that,

* A Paper by the Rev. Stewart D. Headlam, read to the Fabian Society on the 8th January, 1892, and ordered to be printed for the use of the Society.

according to Christ, is a natural, an orderly, almost a beautiful thing ; but the death of a child, or a young man, or a man in the prime of life—that is a monstrous, a disorderly thing : not part of God's order for the world, but the result of wrong-doing somewhere or other. And if you want a rough description of the object of Christian Socialism I should be bold to say that it was to get rid of premature death altogether ; and, when I say that, I am not saying anything absurd or utopian, as you will well understand if you simply compare the death-rate of a poor neighborhood with the death-rate of a well-to-do neighborhood, when you will find that even now, while sanitary science is in its infancy, premature death is very largely indeed the result of poverty or of the many evils connected with poverty.

Turn your attention next to that series of teachings of Christ's which we call parables—comparisons, that is to say, between what Christ saw going on in the everyday world around Him, and the Kingdom of Heaven. If by the Kingdom of Heaven in these parables is meant a place up in the clouds, or merely a state in which people will be after death, then I challenge you to get any kind of meaning out of them whatever. But if by the Kingdom of Heaven is meant (as it is clear from other parts of Christ's teaching is the case), the righteous society to be established upon earth, then they all have a plain and beautiful meaning : a meaning well summed up in that saying, so often quoted against us by the sceptic and the atheist, " Seek ye first the kingdom of God and His righteousness, and all these things shall be added unto you " : or, in other words, Live, Christ said, all of you together, not each of you by himself ; live as members of the righteous society which I have come to found upon earth, and then you will be clothed as beautifully as the Eastern lily and fed as surely as the birds. Well, we have lived, as you know, on the opposite principle to this ; we have lived on the principle of every man for himself and the devil take the hindmost ; we have lived as rivals and competitors instead of living as brothers, laborer competing against laborer, artisan against artisan, shopkeeper against shopkeeper, trader against trader ; with the result that very few of us are clothed beautifully and many of us not fed surely. Christian Socialists therefore say that it would be worth while to try the experiment, which such an one as Jesus Christ said would succeed, to try and live in a rational, organised, orderly brotherhood, believing that then only, but then most certainly, all the men and women and children of England shall be fed surely and clothed beautifully.

Or look for a moment at two of the parables a little more in detail. Take one of the few parables in which Christ spoke about Hell. For though He did not speak of Hell so much as some of His modern followers do, it is important to bear in mind that He was not only the Jesus meek and gentle of whom some of you may have sung in your childhood, but also the Jesus stern and angry ; He had His eight woes as well as His eight blessings ; He had fierce denunciations for those who, as He phrased it, devoured widows' houses and for pretence made long prayers ; for those who made the sabbath-day a dull, dreary day by their narrow rules and restrictions ; for those

who had the key of knowledge and would not enter into the treasure house themselves, and hindered those who wished to enter in from entering. Yes, even He had language which some superfine people would call outrageous, ungentlemanly, when He sent that message to the king of His country, calling him a jackal—a word of the utmost contempt when we remember that the jackal was the natural scavenger of the Eastern city. We need not be surprised, then, that He who at the right time could be so righteously angry, now and again spoke about Hell.

But who, according to Jesus Christ, was the man who was in Hell? It was the rich man who was in Hell; and why was he in Hell? Not simply because he was rich, for Christ said it was possible, though difficult, for a rich man to enter into His society. No; the rich man was in Hell simply because he allowed the contrast between rich and poor to go on as a matter of course, day after day, without taking any kind of pains to put a stop to it. That, according to Christ, was the worst state into which it was possible for a man to fall.

Or take another parable, the parable of the Sheep and the Goats, or the parable of Judgment. In it, if you remember, Christ summoned before His imagination all the nations of the world for judgment; and it is important to note that it was nations and not merely individuals who were summoned by Christ to judgment; for you cannot be a good Christian merely by being good in private life, or domestic life: you must be a good citizen in order to be a good Christian: and so it was nations, and not merely individuals, who were summoned to judgment. And what, according to Christ, did the goodness of a nation consist of? That nation, according to Christ, was good, not which said "Lord! Lord!" most, which was most eager about outward worship or formal religion, but which took care to see that its people were properly clothed, fed, and housed, which looked after those who were in difficulty and distress; and even in the case of those who said they did not know God, who would call themselves or be called by others Atheists, Jesus Christ said that if they were taking pains to see that the people were properly clothed, fed, and housed, however much they might say that they did not know God, God knew them and claimed them as His. Now, what I have to suggest is that modern English Christians need not presume to be more religious than Jesus Christ was; and if He said that the goodness of a nation consisted in seeing that the people were properly clothed, fed and housed, then surely it is the bounden duty of every minister of Christ, from the Archbishop of Canterbury down to the humblest Sunday-school teacher, to be doing their best to see that the men, women and children of England are properly clothed, fed and housed. I hope, then, that I have said sufficient to make it clear that, so far as Christ's works and teachings are concerned, not only is there no contradiction between the adjective "Christian" and the noun "Socialism," but that, if you want to be a good Christian, you must be something very much like a good Socialist.

I know, however, that there are two or three sentences of Christ's which are often quoted against this, the whole tone and tenor of His

work and teaching. There is the sentence, "Blessed are ye poor"; the other, "The poor ye have always with you"; and that passage where, when the younger brother wanted Christ to compel his elder brother to divide his inheritance with him, He said, "Who made me a judge and divider over you? Take heed and beware of covetousness." Let us take this last one first. The younger brother, you will note, was not at all anxious to bring about a general, righteous distribution of wealth; he **was** merely anxious to get into his own possession that which **was** then in the possession of his brother: he was for all the world like those who nowadays are anxious for the abolition of the laws of primogeniture and entail, but who take no interest whatever in general righteous social legislation; and with that kind of thing Jesus Christ said He would have nothing to do—He saw that mere selfishness was at the bottom of it; but He did not on that account say that He and His followers were not to judge between the claims of the monopolists and the owners of land-values on the one side and the industrious people on the other, and to do all that is possible righteously to divide the nation's wealth as it is produced amongst those who produce it. Or, again, "Blessed are ye poor" said Christ, looking on the rough common fishermen and others who were learning from Him, and comparing them with the Scribes and Pharisees, the leaders in Church and State, who were opposing them and Him, and at last got Him killed. He said that these poor men, notwithstanding their poverty, were better and happier men than their opponents; and surely we can well understand that that was a true simple statement of fact; but that simple statement of fact gives no kind of sanction to the teaching that has been drawn from it, that poverty—especially the grinding poverty which is found in our modern centres of civilisation—is the normal condition of things; that what the poor have to do is to put up with their lot here, looking for a great reward hereafter; and that what the ministers of Christ have to do is to teach the poor to be resigned and submissive here, and to tell them of the rich reward hereafter. On the contrary, it seems to me to be the duty of every minister of Christ to do all he possibly can to stir up a divine discontent in the hearts and minds of the people with the evils which surround them. And, once more, "The poor ye have always with you," said Christ; "The poor ye shall have always with you," say modern preachers, and notably the good old Archdeacon of London who was called up on a memorable afternoon to preach to the Socialists in St. Paul's Cathedral. By the way, it is interesting to remember that on that occasion the Socialists were allowed to go to church without having their banners stolen from them by the police; and as they were ranged in front of the west door of their cathedral, I noted that inscribed on those banners and flags there were words taken not from Karl Marx, or Lassalle, or Mr. Hyndman, or Mr. Morris, or Mrs. Besant, or Mr. Champion, or any who were then supposed to be leaders, but taken in almost every case from the sayings of Jesus Christ or His great apostles—so much so that my friend Mr. Hancock shortly afterwards preached and published a sermon which he entitled "The Banner of Christ in the hands of the Socialists." Well, when these men went into their

cathedral they were met by the Archdeacon with words to this effect : No matter, however much you may educate, agitate, organise, you will never get rid of poverty, for Christ has said " The poor ye shall have always with you." Now, from what I have already shown to you, you will see that, if Christ had said that, He would have contradicted the whole of the rest of His work and teaching ; if He had said that when His kingdom was established—one object of which was to get rid of poverty—there should still be poverty He would have stultified Himself ; but He did not say that, He did not prophesy. He simply said, looking back on the history of His nation, looking round on the then condition of His nation, before His kingdom was established, that He noted the persistence of poverty—a very different thing from saying that there always should be poverty. But even if He had said, " The poor ye shall have always with you," would He have been giving any kind of sanction to the state of things which we see now ? I take it that we are all agreed that under the best Socialist *régime* imaginable, if a man is a loafer, whether of the east or west ; if a man refuse to work when he has every facility and opportunity for working, he will fall into poverty or into something much more disagreeable than poverty. But what is it we see now ? Why, this : that on the whole those who work the hardest and produce the most, have the least of the good things of this world for their consumption ; and those who work very little and produce nothing, or nothing adequate in return for what they consume, have the most of the good things of this world for their consumption. So much so, that as we have been taught, all society at present can be classified into beggars, robbers, and workers. If a man is not working for his living, he must either be a beggar, living on the charity of others, or a robber preying upon the hard-won earnings of others. And if, again, you want a rough description of the object of Christian Socialism, I should say that it was to bring about the time when all shall work, and when, all working, work will be a joy instead of the " grind " it is at present, and to bring about the time when the robbers shall be utterly abolished. I hope, then, you will see that there is nothing in these three passages, so often quoted against us, to contradict the whole of the rest of Christ's work and teaching, and that therefore a follower of Christ is bound to be an out-and-out fighter against poverty, not merely alleviating its symptoms, but getting at the very root and cause of it.

But you know that Christ not only worked and taught like this, but He deliberately founded a society to keep on doing, throughout the world on a large scale, what He began to do by way of example, in miniature, in Palestine. He said, you know, shortly before His death, to those who were to be the leaders in that society : " He that is loyal to me, the works that I do shall he do also, and greater works shall he do." The Christian Church therefore is intended to be a society not merely for teaching a number of elaborate doctrines—important as they may be for the philosophical defence of the faith—not even for maintaining a beautiful ritual and worship—important as that is if men and women are to have all their faculties fully developed ; but mainly and chiefly for doing on a large scale

throughout the world those secular, socialistic works which Christ did on a small scale in Palestine. Now this being so, you would expect to find that the first leaders of the society, though they would be mainly occupied in foundation work, would have something to say on these secular, socialistic questions. Take, for instance, St. Paul; what is his great labor law? The husbandman that laboreth, said St. Paul, should be the first to partake of the fruits. The laborer is to be the first, not the second after the capitalist or the third after the landlord, to share the profits resulting from his work. Or again, St. Paul said, in words which it would be well indeed to din into the ears of the Duke of Westminster and the other appropriators of ground values, "Let the robber rob no more, but rather let him labor"; recognising that fact of which I have spoken, that if a man is not working for his own living he is preying on the living of others. Or again, take St. James, who was in such close companionship with Jesus for years. His little pamphlet, which has come down to us through the ages, is full of burning words on the labor question. Take one sentence as a sample, where he says that the cry of the reapers who had been defrauded of their wages had entered into the ears of God, who fights; that God fought against every law or custom which tended to deprive the laborers of the full reward of their work. And if God so fights, then surely it is certain that it is the imperative duty of every Christian in England to fight against all laws or customs which prevent the workers in England from enjoying the fruits of their work. Or again, take the two great permanent institutions of the Church, the two sacraments which are universally necessary to salvation—Holy Baptism and Holy Communion; you will find that they are both entirely on our side. In Holy Baptism, you know, we claim every little baby born into the world as being the equal with every other little baby, no matter whether it be the child of a costermonger or the child of a prince; not waiting for conversion or illumination, or election or proof of goodness, but simply because it is a human being, we claim it as of right a member of Christ, the child of God and an inheritor—not merely a future heir but a present inheritor—of the Kingdom of Heaven. The great sacrament of equality is assuredly entirely on our side. And so, too, is the Holy Communion. The very name tells you that those who partake of it are bound to live in brotherhood, in fellowship, with one another. There is a hymn sung in church about having mystic, sweet communion with those whose work is done; and those of you who, like rational beings, have been in the habit of praying for the dead, will know the value of that communion. But it is even more important to have communion equally mystic and sweet with those whose work is going on. And that is what this great sacrament teaches us to have. Indeed, it has been well said that the real, terrible blasphemer is not the man who uses foul language at the corners of the street, nor the men who used to publish those woodcuts in the *Freethinker*—libels as they were on dead men and a beautiful literature; but rather the man or woman who says the "Our Father" morning and evening and takes no kind of pains to realise through-

out the day the brotherhood which the fatherhood implies, or who comes to the Holy Communion, Sunday by Sunday, month by month, or festival by festival, and is not striving in every-day life to realise the fellowship which the Holy Communion implies. Yes, the great sacrament of brotherhood is entirely on our side.

Once more, take the one only document which is binding on all members of the Church of England, the Church Catechism.* You will find it full of good, sound teaching in the principles of Christian Socialism. Let me give you one sentence only, a piece of ethical teaching, which, if it were carried out, would alter the whole face of English society. It is there taught that it is the duty which each one, man or woman, rich or poor, owes to his neighbor, to learn and labor truly to get his own living; not to himself, be it noted, in order that he may "get on"—for you cannot now get on without getting somebody else off—but to his neighbor, that he may be an honest man. It has been calculated, as you know, that if all took their share of the work of the world, none would have to work for more than four hours a day; that the reason why so many have to work under such evil conditions and for so long a time is because they have to produce not only sufficient for themselves and their families, but also sufficient for a large number of others who are themselves producing nothing, or nothing adequate, in return for what they consume. It is against this evil that our socialistic Catechism is aimed. And let it be remembered that, according to its teaching, it is no kind of excuse for a man or a woman to say: "True, I do not give back in return for what I consume anything that I myself have produced, but I give back something which my ancestors have produced." To such we say, You eat your own dinners, you wear your own clothes, you require for yourself so much house-room; your great-grandfather can't eat your dinners, or wear your clothes, or use your house; and therefore, in common honesty, you are bound to give back, not something which your great grandfather has produced, but which you yourself have produced. And lastly, think of that Song of Our Lady, the gentle mother of Jesus Christ, she whom we speak of as not only bright as the sun, fair as the moon, but also terrible as an army with banners. You will find that she has some terrible words there. She holds up to the scorn of the ages, as pests of society, three sets of people, the proud, the mighty, and the rich. "He hath put down the mighty from their seats (or dynasties from their thrones), He has scattered the proud; the rich He hath sent empty away." No wonder that some of the more far-seeing Socialists are eager now and again to go to their cathedrals or parish churches, when they have such revolutionary language as that sung to them.

This, then, must be sufficient to indicate to you what is the religious basis of our Socialism. The work and teaching of Jesus Christ, the testimony of His apostles, of the two greatest sacraments, of the Church Catechism, of the Magnificat—they all surely make it

* See the author's "Laws of Eternal Life: being Studies in the Church Catechism" (Guild of St. Matthew, 376 Strand, London, W.C.; one shilling, net).

clear that a Christian is bound to cut right away at the root of that evil which is the main cause of poverty, and which prevents men from living full lives in this world.

But at this point I can fancy some of my hearers saying, This is all very well, but if this be true, then the logical result of it is that the bishops in each diocese with their cathedrals, and the parsons in each parish with the churches, should be real leaders and centres of Social-Democracy, leading the Church forward to war against poverty; whereas we know that the bishops and clergy, so far from leading, have often tried to hinder all who would help. And though I probably should maintain that there are many more exceptions to the truth of this charge than my hearers would be disposed to admit, I acknowledge the truth of it, and I seek for the cause of it. And there is one reason, at any rate. It is this: that you and your forefathers have allowed the Church to be gagged and fettered; instead of allowing the Church to elect her own bishops and clergy, you have forced them on her from outside. And so, now, anyone rather than the whole body of the parish elects the parish priest; sometimes the landlord, sometimes the bishop; or a builder who wants his villas to let, or a college at Oxford or Cambridge, or a peer, or a jockey at Newmarket; anyone, rather than the only people who ought to do it, has the power given them by you to do it. I suggest to you, therefore, by the way, that you cannot expect the Church to live up to the law of her being until you have disestablished and disendowed those whom you now allow to lord it over the Church, and left her free to manage her own affairs. A complete Christian Socialism cannot be brought about until the Church is free to use influence and discipline for the establishment of the Kingdom of Heaven upon earth.

In the meanwhile, much can be done by those Churchmen who remember that the State is a sacred organisation as well as the Church. They can unite with Socialists of every sort in their endeavor to seize the State and to use it for the well-being of the masses instead of the classes; or in more prosaic words, they may help to get delegates or deputies returned to Parliament who will carry out the people's will. And therefore for the rest of this paper, having given you what seem to me to be the principles upon which a Christian is bound to be a Socialist, I will touch upon three items on which, in practical politics, we should specially lay stress. And it is important to do this, both because many Christians are somewhat vague in their Socialism, and many Socialists, in my opinion, fail to get at the root of the matter in their joy at getting this or that restriction carried out effectually. First of all, then, we naturally think of the children; and having got the London day-schools free, we should put forth what energy we can for a liberal expenditure in making them comfortable and pleasant, spending ungrudgingly on such matters as music and swimming; decreasing the number of children for each teacher, especially in the case of the highest standard and of the exceptionally backward children. We should of course also make the continuation classes free, and, further, allow no grant of public money to be given in any form

whatever to privately managed schools. These may seem but mild matters to many of the Fabians; but I cannot help thinking that if our society had been in dead earnest about them last November, the result of the elections would have been different. Of course, it must be frankly stated that these little reforms will not directly tend to raise wages, unless they could be accompanied by general raising of the school age, and then only slightly. While the means of production are monopolised by a few, the reasons for giving the many the best possible schooling are not that it will enable them to get on, but that it will give them the key of knowledge, that it will help to make them discontented, and that it will to some degree teach the value of discipline and inter-dependence. We school them to a large degree with this in view, that they may know what is the evil they have to attack and how to attack it. We *do* want to educate them above their station—not indeed above that state of life into which it shall please God to call them, but above that into which devilish robbery and monopoly has forced them. Let us once have a generation of young people growing up, fairly well educated and thoroughly discontented, and the legal, orderly social revolution for which some of us are working cannot be long delayed.

Secondly, in considering their practical political program, Christian Socialists have to remember, and to remind others, that we are all employers of labor. Now it is a commonplace of Christian ethics that, while there exist employers and employed, they have duties towards each other. No self-respecting middle-class householder would deny this in the case of his housemaid. What we have to do is to extend the sphere of duty—to get men to understand that nationally or municipally they have thousands of servants whom they employ, and to feel that it is their duty to see that these are not overworked or underpaid; or, in other words, to follow the example set by the last London School Board, and see to it that all those employed by School Boards, Vestries, County Councils, and Parliament are not worked for more than, say, eight hours a day, and are paid the minimum trade union rate of wages. This a Christian Socialist must insist upon simply as a duty of the delegate of the people to those whom the people employ. If he so treats it, he will not be surprised to find that three years after the duty had, for the first time in English history, been done, those who had benefited by it were so far from being grateful for it that they would not take the trouble to come out on a wet afternoon and vote for those who had got them the benefit. But, further, the people have to remember that no railways, tramways, water-pipes, gas-pipes, wires, etc., can be laid down without their consent; and that therefore it is their duty, whenever through their various delegates or deputies they give that consent, to make as a condition that those who are employed in these various industries should not be overworked or underpaid. This I am urging as a matter of duty from the people to those whom they employ, not as a matter of right on the part of the workers from those who employ them. Duty is a stronger motive power than right; and it will be time enough for the great mass of the workers to claim their rights from those who employ

them when they have discharged their duties to those whom they employ. This will involve losing half-an-hour's wages and running the risk of getting a wet coat perhaps once or twice in three years ; but men who do not care to make that sacrifice in order to discharge their duties are not worth helping in order to get their rights.

Lastly, I come to what is the main plank in the platform of the Christian Socialist, the chief political reform at which he aims ; being bound by his creed to go to the very heart of the matter ; to be content with no tinkering. It is summed up in the resolution which was moved by the English Land Restoration League in Trafalgar Square ; after which the authorities, being Conservative authorities, wisely settled that no more should be said there for the present. It ran as follows :—" That the main cause of poverty, both in the agricultural districts and in the great centres of population, is the fact that the land, which ought to be the common property of all, is now monopolised by a few ; and that therefore those who want to cut away at the root of poverty must work to restore to the people the whole of the value which they give to the land, to get for the people complete control over the land, and to that end see to it that those who use land pay for the use of it to its rightful owners, the people."

Let me make it clear to you how far-reaching will be the revolution worked out by this reform. Let me remind you that if the laborers could get access to the land in the country, even under the condition of paying the same rent per acre to the landlords for a few acres that the farmers now pay for a large number of acres, they would be able, by cultivating those few acres, to get more for themselves and their families than they now get by means of the current rate of wages in the district. This has been proved over and over again by the landlords refusing to let land to the laborers at the same rent per acre for a few acres as they let it at for a large number of acres to the farmers, giving openly as the reason that if they did so wages would be raised. Now, I need hardly remind you that if wages are raised in agricultural labor, there is a tendency for wages to rise everywhere. Much more therefore would the laborers be better off if, instead of paying rent for those few acres to the landlord, they simply paid the rent in form of taxation to the State, having to pay no other taxation whatever. They would be better off, not only owing to the relief from taxation, but because the so-called iron law of wages would then no longer operate ; that law being that while the means of production are monopolised by a few, wages tend to go down to the minimum at which the workers will consent to live and reproduce. But once get the land, which is the main means of production, into the hands of the people, and then instead of laborer competing with laborer for employment, you would have employer competing against employer for labor ; which would bring about a very different state of things. Or again, consider what is going on throughout the agricultural districts. The laborers by the action of landlordism are being forced off the soil. Where do these men go to ? Our own experience tells us ; the Dockers' Union will tell us ; the defeated gas stokers will tell us. It is probably useless and certainly unchristian for comfortable canons to denounce these men

as blacklegs. The useful and the Christian thing to do is what Mr. Verinder and his Red Vans have done, and help to keep them in the country and there fight landlordism. For of course you know that, forced off the soil, they crowd into the already overcrowded large towns; there they compete against the men and women of the towns in their trades and employments and so tend to lower their wages; and they compete also for house room, and so tend to raise rents. This, I say, is proved by experience, and could be proved by statistics; the population of the villages and country districts not having increased in anything like the ordinary normal increase of the birth-rate over the death-rate; while the population in the large towns has increased very much more than the ordinary normal increase of the birth-rate over the death. So I have shown to you that landlordism prevents wages from being raised, tends directly to the lowering of wages and the raising of rents. Am I not right therefore in saying that this is the root question, the bottom question, which must be dealt with if we want not merely to alleviate poverty by charity, or tinker at it by semi-socialistic trade restrictions, but to get rid of it altogether?

But this question can be dealt with, if you like, entirely from the point of view of townsfolk and their rights. If, when discussing the matter, you find that your friend is learned in manures and crops and scientific agriculture, you can for the moment, for the sake of argument, give him in the country altogether, and look at the question solely as the dweller in a large town. I remember, some years ago now, at the Industrial Remuneration Conference, held in Prince's Hall, Piccadilly, presided over by Sir Charles Dilke, whom that most immoral Mr. Stead is still trying to keep from serving his country, that Mr. Balfour, the atheist coercionist, was reading a learned paper, in the course of which he said that the land question, however interesting to philosophers and economists, was not a practical question; for land in England was almost unsaleable. I ventured to interrupt him by asking whether the land on which we were then met was altogether unsaleable. He replied that he was only speaking of land in the country. Well, I have already pointed out to you, that if the laborers could get access to it, land in the country would not be altogether unsaleable; that it may not be well able to support landlord, farmer, and laborer, but that it could well support one man willing to work hard if he was landlord, farmer, and laborer combined. And by the way, however much men say land is unsaleable, you never find them willing to give away, out and out, one single acre of it. But I say, if you like, you can look solely at town lands. And what do you find then? Why, you find land in the City of London worth more than £30 per superficial foot; land in Belgravia worth more than land in Bethnal Green; land in Bethnal Green worth more than land in Epping Forest. Now what is it that makes the land more and more valuable? Simply the people living or working in any neighborhood, or wanting to live and work there. Yet into whose pockets does the whole of this value go? Not into the pockets of the men and women who create it, but into the pockets of those who, often simply because they are

the sons of their fathers, are the owners of the ground rents and values. Robbery is the only accurate word which a Christian Socialist can use to describe this state of things. And there is another reason why robbery is the only right word to use to describe our present system of landlordism. It is this : that land in England used to be held in return for services ; so much for the army, for the navy, for building bridges, making roads ; so much for what is now done by means of the poor laws. These were the various conditions under which land was held. By degrees, however, a Parliament of landowners and their friends began to shift off from themselves the responsibility of returning these services to the State, and began to tax the ordinary articles of the people's consumption, leaving upon themselves a paltry tax of 4s. in the pound ; which tax, being assessed not upon the value which land now has, but which it had about 200 years ago, is, I believe, now practically a tax varying from 1½d. to 2½d. in the pound. Now what we Christian Socialists urge is that a Parliament of the people, if they will but take the pains to send honest and obedient delegates to carry out their will, ought gradually but as quickly as possible, to reverse that process ; to take off all taxation from the articles of the people's consumption, and by degrees to tax the land values, till at last, taxing them 20s. in the pound, you take the whole of the land values for the benefit of those who create them. I know there are those who maintain that this would do but little to benefit the worker, because they allege he is hardly taxed at all at present. To them of course we reply that while the main object of the reform is not the relief from taxation, but to get the land, the main means of production, into the hands of the people, so that the iron law of wages might no longer operate ; yet practically the relief from taxation would be important. For I believe I underestimate it when I say—and this should bring every frugal housewife on to our side—that if you spend two shillings on a pound of tea, at least one shilling of that is tax, or the expense of collecting the tax ; for every shilling you spend on cocoa, 1½d. is tax ; every shilling on coffee, 1½d. ; every shilling on currants and raisins, 1½d. If you spend 3d. on tobacco, a full 2½d. of that is tax ; and if by degrees you spend five shillings on whisky, 4s. 4½d. of that is tax or the expenses connected with the tax. But it is not only the surface of the earth—to which this value, so evidently designed for taxation, is attached by people living and working in any neighborhood—which the landlords claim ; but also the minerals which, in the equally marvellous processes of nature, it has taken centuries to create under the earth : the limestone, the coal, the iron—three things so essential for our great English industries—are claimed by robber landlords. And so, too, the sea-shore and the rivers ; so that, as Henry George has well said, every salmon which comes up from the sea might just as well have a label on it, “ Lord or Lady So-and-So, with God Almighty's compliments.”

We Christian Socialists, then, maintain that this is the most far-reaching reform ; that it is demanded by justice ; and not only that it can be carried out in consistence with the highest morality, but that morality is impossible without it.

Yes, but someone says, this would be all right if you were starting in a new country, but the nation in the past has sanctioned the present system; it would be destructive of all credit to get rid of landlordism without compensating the landlords. To which we reply that the nation has never given its verdict one way or the other, and that now that it is gradually getting its power to speak, it is beginning to be evident what it will say; and further, that even if the whole nation in the past had given away to a few people in this generation that without which the whole body of the people cannot live full lives, it would have been doing that which it had no kind of right to do; that the land of every country belongs of natural and inalienable right to the whole body of the people in each generation, and as for compensation, from the point of view of the highest Christian morality, it is the landlords who should compensate the people, not the people the landlords. But practically, if you carry out this reform by taxation, no compensation would be necessary or even possible. We say therefore, "You need not kick the landlords out; you must not buy them out; you had better tax them out." And by this process no one will suffer; land will naturally get into the hands of those who will use it best; the thrifty artisan who has bought the piece of land on which his house is built will be much better off than he is now if all he has to pay in taxation, local or imperial, is its ground value to the State. The man—say, the vestryman—who is partly working for his living, and partly living by speculating on the wants of others by having bought a street or two of houses, will find that this reform will make it more convenient for him to live entirely by working. The Duke of Westminster and the Duke of Bedford—or rather their children—will be healthier and happier people if they have to take their fair share of the work of the world. Russell Square, if the owners of the houses round have the choice of being rated at what it would let at for building purposes, or of opening it to the public, would fulfil the old prophecy, and the gardens of the city would be full of boys and girls playing; and marriage-hindering Mammon being utterly annihilated, the Alma Venus of Lucretius would again have her way. *Hinc lætas urbes pueris florere videbis.*

I have now endeavored to put before you the theological basis of Christian Socialism, and the special political work with which it is concerned. But, although during the last few years there is an increasing number of the clergy who are becoming more or less socialistic in their teaching, it would be affectation to pretend that the kind of doctrine I have given in this lecture is the current teaching in the Church at present. In fact, we are often seriously condemned for the line we have taken. It is complained of that we ignore the Eighth Commandment, that we talk about rights rather than duties, that we value material rather than spiritual things. As to the Eighth Commandment, we should indeed be foolish as well as wrong to ignore it; for it is entirely on our side. "Thou shalt not steal" is proclaimed from the altar of West-end churches to upper and middle-class congregations, as well as in prison and peni-

tentiary chapels; because the Church recognises, even though individual clergymen may fail to do so, that it is just as possible, indeed much more probable, that the rich will rob from the poor, as that the poor will rob from the rich. "Thou shalt not steal" is just the commandment we want to get kept; we want to put a stop to the robbery of the poor by the rich, which has been going on for so long. And as for rights and duties, it is well said that there are no rights without duties and no duties without rights. But we admit that duty is a more sacred thing than right. And I thank my opponents for giving me that word, for it enables me to say, as I have to thousands up and down the country, that it is your bounden duty to claim your rights in this matter. It is not a thing which you may take up or let alone just on the ground that you feel the pinch of poverty or not, but a duty which you owe to yourselves, to your children, to the outcasts from society; to all who are tempted to degrade their lives in any way for the sake of a living. And more, it is the duty which you owe to God. The earth is the Lord's, and therefore not the landlord's; the earth is the Lord's, and He hath given it unto the children of men. And what would any man among you think if he gave to the woman whom he loved some valuable present, and she lightly allowed it to be taken from her? He would be jealous of the man who got it away; and so I say that God is jealous when He finds that we have allowed the most valuable of all the material gifts which He has given to His creatures—for "land is the mother and labor the father of all wealth"—to be filched away from us by the Duke of This or Lord That. God is jealous, and we are not doing our duty to God any more than we are doing our duty to our neighbor, unless we are doing our very best to prevent this. And as for material things and spiritual things, I know full well that man does not live by bread alone. I am as eager for the spiritual welfare of the people as the vicar of this parish or the bishop of this diocese. I know that it is not only the pasture but the Presence of which the people have been deprived. But when they say that because of the importance of spiritual things we should not turn our attention to these great material reforms, I wonder whether they have realised the heredity and environment of a vast mass of the people; whether they have considered the evils which result, not only from extreme poverty, but from poverty side by side with wealth; how art is now almost impossible, and lives which should be brimful of mirth and joy are stunted. Because, I take it, that when once a man realises the evils of our present social state, just because he is eager for the spiritual life of the people, he will be doing all he possibly can to put a stop to that robbery which is the main cause of poverty, and so by degrees to establish the Kingdom of Heaven upon earth. *Expecto vitam venturi sæculi*: I look for the life of the coming age.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. Paper cover, design by A. G. Watts. 3d., post free 4d.; 2/3 per doz., post free, 2/7.

FABIANISM AND THE EMPIRE: A Manifesto. 1s. post free.

FABIAN ESSAYS IN SOCIALISM. (43rd Thousand.)

Paper cover, 1/-; plain cloth, 2/-, post free from the Secretary.

FABIAN TRACTS AND LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 81, 3s.; post free 3/5. Bound in Buckram, 4/6; post free for 5s.

I.—General Socialism in its various aspects.

TRACTS.—121. Public Service versus Private Expenditure. By Sir OLIVER LODGE. 113. Communism. By WM. MORRIS. 107. Socialism for Millionaires. By BERNARD SHAW. 133. Socialism and Christianity. By Rev. PERCY DEARMER. 78. Socialism and the Teaching of Christ. By Dr. JOHN CLIFFORD. 87. The same in Welsh. 42. Christian Socialism. By Rev. S. D. HEADLAM. 79. A Word of Remembrance and Caution to the Rich. By JOHN WOOLMAN. 75. Labor in the Longest Reign. By SIDNEY WEBB. 72. The Moral Aspects of Socialism. By SIDNEY BALL. 69. Difficulties of Individualism. THE IMPOSSIBILITIES OF ANARCHISM.*

Anarchists and Socialists.

SOME years ago, as the practical policy of the Socialist party in England began to shape itself more and more definitely into the program of Social-Democracy, it became apparent that we could not progress without the gravest violations of principles of all sorts. In particular, the democratic side of the program was found to be incompatible with the sacred principle of the Autonomy of the Individual. It also involved a recognition of the State, an institution altogether repugnant to the principle of Freedom. Worse than that, it involved compromise at every step; and principles, as Mr. John Morley once eloquently showed, must not be compromised. The result was that many of us fell to quarrelling; refused to associate with one another; denounced each other as trimmers or Impossibilists, according to our side in the controversy; and finally succeeded in creating a considerable stock of ill-feeling. My own side in the controversy was the unprincipled one, as Socialism to me has always meant, not a principle, but certain definite economic measures which I wish to see taken. Indeed, I have often been reproached for limiting the term Socialism too much to the economic side of the great movement towards equality. That movement, however, appears to me to be as much an Individualist as a Socialist one; and though there are Socialists, like Sir William Harcourt, to whom Socialism means the sum total of humanitarian aspiration, in which the transfer of some millions of acres of property from private to public ownership must seem but an inessential and even undesirable detail, this sublimer shade of Socialism suffers from such a lack of concentration upon definite measures, that, but for the honor and glory of the thing, its professors might as well call themselves Conservatives. Now what with Socialists of this sort, and persons who found that the practical remedy for white slavery was incompatible with the principle of Liberty, and the practical remedy for despotism incompatible with the principle of Democracy, and the practical conduct of politics incompatible with the principle of Personal Integrity (in the sense of having your own way in everything), the practical men were at last driven into frank Opportunism. When, for instance, they found national and local organization of the working classes opposed by Socialists on the ground that Socialism is universal and international in principle; when they found their Radical and Trade Unionist allies ostracized by Socialists for being outside the pale of the Socialist faith one and indivisible; when they saw agricultural laborers alienated by indiscriminating denunciations of allotments as "individualistic"; then they felt the full force of the

* A paper read to the Fabian Society by G. Bernard Shaw, on 16th October, 1891.

saying that Socialism would spread fast enough if it were not for the Socialists. It was bad enough to have to contend with the conservative forces of the modern unsocialist State without also having to fight the seven deadly virtues in possession of the Socialists themselves. The conflict between ideal Socialism and practical Social-Democracy destroyed the Chartist organization half a century ago, as it destroyed the Socialist League only the other day. But it has never gone so far as the conflict between Social-Democracy and Anarchism. For the Anarchists will recommend abstention from voting and refusal to pay taxes in cases where the Social-Democrats are strenuously urging the workers to organize their votes so as to return candidates pledged to contend for extensions of the franchise and for taxation of unearned incomes, the object of such taxation being the raising of State capital for all sorts of collective purposes, from the opening of public libraries to the municipalization and nationalization of our industries. In fact, the denunciation of Social-Democratic methods by Anarchists is just as much a matter of course as the denunciation of Social-Democratic aims by Conservatives. It is possible that some of the strangers present may be surprised to hear this, since no distinction is made in the newspapers which support the existing social order between Social-Democrats and Anarchists, both being alike hostile to that order. In the columns of such papers all revolutionists are Socialists; all Socialists are Anarchists; and all Anarchists are incendiaries, assassins and thieves. One result of this is that the imaginative French or Italian criminal who reads the papers, sometimes declares, when taken red-handed in the commission of murder or burglary, that he is an Anarchist acting on principle. And in all countries the more violent and reckless temperaments among the discontented are attracted by the name Anarchist merely because it suggests desperate, thorough, uncompromising, implacable war on existing injustices. It is therefore necessary to warn you that there are some persons abusively called Anarchists by their political opponents, and others ignorantly so described by themselves, who are nevertheless not Anarchists at all within the meaning of this paper. On the other hand, many persons who are never called Anarchists either by themselves or others, take Anarchist ground in their opposition to Social-Democracy just as clearly as the writers with whom I shall more particularly deal. The old Whigs and new Tories of the school of Cobden and Bright, the "Philosophic Radicals," the economists of whom Bastiat is the type, Lord Wemyss and Lord Bramwell, Mr. Herbert Spencer and Mr. Auberon Herbert, Mr. Gladstone, Mr. Arthur Balfour, Mr. John Morley, Mr. Leonard Courtney: any of these is, in England, a more typical Anarchist than Bakounin. They distrust State action, and are jealous advocates of the prerogative of the individual, proposing to restrict the one and to extend the other as far as is humanly possible, in opposition to the Social-Democrat, who proposes to democratize the State and throw upon it the whole work of organizing the national industry, thereby making it the most vital organ in the

social body. Obviously there are natural limits to the application of both views; and Anarchists and Social-Democrats are alike subject to the fool's argument that since neither collective provision for the individual nor individual freedom from collective control can be made complete, neither party is thoroughly consistent. No dialectic of that kind will, I hope, be found in the following criticism of Anarchism. It is confined to the practical measures proposed by Anarchists, and raises no discussion as to aims or principles. As to these we are all agreed. Justice, Virtue, Truth, Brotherhood, the highest interests of the people, moral as well as physical: these are dear not only to Social-Democrats and Anarchists, but also to Tories, Whigs, Radicals, and probably also to Moonlighters and Dynamitards. It is with the methods by which it is proposed to give active effect to them that I am concerned here; and to that point I shall now address myself by reading you a paper which I wrote more than four years ago on the subject chosen for to-night. I may add that it has not been revived from a wanton desire to renew an old dispute, but in response to a demand from the provincial Fabian Societies, bewildered as they are by the unexpected opposition of the Anarchists, from whom they had rather expected some sympathy. This old paper of mine being the only document of the kind available, my colleagues have requested me to expunge such errors and follies as I have grown out of since 1888, and to take this opportunity of submitting it to the judgment of the Society. Which I shall now do without further preamble.

Individualist Anarchism.

The full economic detail of Individualist Anarchism may be inferred with sufficient completeness from an article entitled "State Socialism and Anarchism: how far they agree, and wherein they differ," which appeared in March, 1888, in *Liberty*, an Anarchist journal published in Boston, Mass., and edited by the author of the article, Mr. Benjamin R. Tucker. An examination of any number of this journal will shew that as a candid, clear-headed, and courageous demonstrator of Individualist Anarchism by purely intellectual methods, Mr. Tucker may safely be accepted as one of the most capable spokesmen of his party.

"The economic principles of Modern Socialism," says Mr. Tucker, "are a logical deduction from the principle laid down by Adam Smith in the early chapters of his *Wealth of Nations*—namely, that labor is the true measure of price. From this principle, these three men [Josiah Warren, Proudhon and Marx] deduced 'that the natural wage of labor is its product.'"

Now the Socialist who is unwary enough to accept this economic position will presently find himself logically committed to the Whig doctrine of *laissez-faire*. And here Mr. Tucker will cry, "Why not? *Laissez-faire* is exactly what we want. Destroy the money monopoly, the tariff monopoly, and the patent monopoly. Enforce then only those land titles which rest on personal occupancy or cultiva-

tion;* and the social problem of how to secure to each worker the product of his own labor will be solved simply by everyone minding his own business."†

Let us see whether it will or not. Suppose we decree that henceforth no more rent shall be paid in England, and that each man shall privately own his house, and hold his shop, factory, or place of business jointly with those who work with him in it. Let everyone be free to issue money from his own mint without tax or stamp. Let all taxes on commodities be abolished, and patents and copyrights be things of the past. Try to imagine yourself under these promising conditions with life before you. You may start in business as a crossing sweeper, shopkeeper, collier, farmer, miller, banker, or what not. Whatever your choice may be, the first thing you find is that the reward of your labor depends far more on the situation in which you exercise it than on yourself. If you sweep the crossing between St. James's and Albemarle Streets you prosper greatly. But if you are forestalled not only there, but at every point more central than, say, the corner of Holford Square, Islington, you may sweep twice as hard as your rival in Piccadilly, and not take a fifth of his toll. At such a pass you may well curse Adam Smith and his principle that labor is the measure of price, and either advocate a democratically constituted State Socialist municipality, paying all its crossing sweepers equally, or else cast your broom upon the Thames and turn shopkeeper. Yet here again the same difficulty crops up. Your takings depend, not on yourself, but on the number of people who pass your window per hour. At Charing Cross or Cheapside fortunes are to be made: in the main street at Putney one can do enough to hold up one's head: further out, a thousand yards right or left of the Portsmouth Road, the most industrious man in the world may go whistle for a customer. Evidently retail shopkeeping is not the thing for a man of spirit after Charing Cross and Cheapside have been appropriated by occupying owners on the principle of first come first served. You must aspire then to wholesale dealing—nay, to banking. Alas! the difficulty is intensified beyond calculation. Take that financial trinity, Glyn, Mills and Currie; transplant them only a few miles from Lombard Street; and they will soon be

* This is an inference from the following paragraph in Mr. Tucker's article:

"Second in importance comes the land monopoly, the evil effects of which are seen principally in exclusively agricultural countries, like Ireland. This monopoly consists in the enforcement by government of land titles which do not rest on personal occupancy and cultivation. It was obvious to Warren and Proudhon that as soon as individuals should no longer be protected by their fellows in anything but personal occupation and cultivation of land, ground rent would disappear, and so usury have one less leg to stand on."

See also Mr. Tucker's article entitled "A Singular Misunderstanding," in *Liberty* of the 10th September, 1892. "Regarding land," writes Mr. Tucker, "it has been steadily maintained in these columns that protection should be withdrawn from all land titles except those based on personal occupancy and use."

† "Nor does the Anarchistic scheme furnish any code of morals to be imposed on the individual. 'Mind your own business,' is its only moral law."

objects of pity to the traditional sailor who once presented at their counter a cheque for £25 and generously offered to take it in instalments, as he did not wish to be too hard on them all at once. Turning your back on banking, you meddle in the wheat trade, and end by offering to exchange an occupying ownership of all Salisbury Plain for permission to pay a rack rent for premises within hail of "The Baltic" and its barometer.

Probably there are some people who have a blind belief that crossing sweepers, "The Baltic," Lombard Street, and the like, are too utterly of the essence of the present system to survive the introduction of Anarchism. They will tell me that I am reading the conditions of the present into the future. Against such instinctive convictions it is vain to protest that I am reading only Mr. Tucker's conditions. But at least there will be farming, milling, and mining, conducted by human agents, under Anarchism. Now the farmer will not find in his perfect Anarchist market two prices at one time for two bushels of wheat of the same quality; yet the labor cost of each bushel will vary considerably according to the fertility of the farm on which it was raised, and the proximity of that farm to the market. A good soil will often yield the strongest and richest grain to less labor per acre or per bushel than must be spent on land that returns a crop less valuable by five shillings a quarter. When all the best land is held by occupying owners, those who have to content themselves with poorer soils will hail the principle that labor is the measure of price with the thumb to the nose. Among the millers, too, there must needs be grievous mistrust of Proudhon and Josiah Warren. For of two men with equally good heart to work and machinery to work with, one may be on a stream that will easily turn six millstones; whilst the other, by natural default of water, or being cut off by his fellow higher up stream, may barely be able to keep two pairs of stones in gear, and may in a dry season be ready to tie these two about his neck and lie down under the scum of his pond. Certainly, he can defy drought by setting to work with a steam engine, steel rollers, and all the latest contrivances for squashing wheat into dust instead of grinding it into flour; yet, after all his outlay, he will not be able to get a penny a sack more for his stuff than his competitor, to whose water-wheel Nature is gratuitously putting her shoulder. "Competition everywhere and always" of his unaided strength against that of his rival he might endure; but to fight naked against one armed with the winds and waves (for there are windmills as well as watermills) is no sound justice, though it be sound Anarchism. And how would occupying ownership of mines work, when it is an easier matter to get prime Wallsend and Silkstone out of one mine than to get slates and steam fuel out of another, even after twenty years' preliminary shaft-sinking? Would Mr. Tucker, if he had on sale from a rich mine some Silkstone that had only cost half as much labor as steam coal from a relatively poor one, boldly announce:—"Prices this day: Prime Silkstone, per ton, 25s.; best steam ditto, 50s. Terms, cash. Principles, those of Adam Smith—see 'Wealth of Nations' *passim*?"

Certainly not with "competition everywhere and always," unless custom was no object to him in comparison with principle.

It is useless to multiply instances. There is only one country in which any square foot of land is as favorably situated for conducting exchanges, or as richly endowed by nature for production, as any other square foot; and the name of that country is Utopia. In Utopia alone, therefore, would occupying ownership be just. In England, America and other places, rashly created without consulting the Anarchists, Nature is all caprice and injustice in dealing with Labor. Here you scratch her with a spade; and earth's increase and foison plenty are added to you. On the other side of the hedge twenty steam-diggers will not extort a turnip from her. Still less adapted to Anarchism than the fields and mines is the crowded city. The distributor flourishes where men love to congregate: his work is to bring commodities to men; but here the men bring themselves to the commodities. Remove your distributor a mile, and his carts and travellers must scour the country for customers. None know this better than the landlords. Up High Street, down Low Street, over the bridge and into Crow Street, the toilers may sweat equally for equal wages; but their product varies; and the ground rents vary with the product. Competition levels down the share kept by the worker as it levels up the hours of his labor; and the surplus, high or low according to the fertility of the soil or convenience of the site, goes as high rent or low rent, but always in the long run rack rent, to the owner of the land.

Now Mr. Tucker's remedy for this is to make the occupier—the actual worker—the owner. Obviously the effect would be, not to abolish his advantage over his less favorably circumstanced competitors, but simply to authorize him to put it into his own pocket instead of handing it over to a landlord. He would then, it is true, be (as far as his place of business was concerned) a worker instead of an idler; but he would get more product as a manufacturer and more custom as a distributor than other equally industrious workers in worse situations. He could thus save faster than they, and retire from active service at an age when they would still have many years more work before them. His ownership of his place of business would of course lapse in favor of his successor the instant he retired. How would the rest of the community decide who was to be the successor—would they toss up for it, or fight for it, or would he be allowed to nominate his heir, in which case he would either nominate his son or sell his nomination for a large fine? Again, his retirement from his place of business would leave him still in possession, as occupying owner, of his private residence; and this might be of exceptional or even unique desirability in point of situation. It might, for instance, be built on Richmond Hill, and command from its windows the beautiful view of the Thames valley to be obtained from that spot. Now it is clear that Richmond Hill will not accommodate all the people who would rather live there than in the Essex marshes. It is easy to say, Let the occupier be the owner; but the question is, Who is to be the occupier? Suppose it

were settled by drawing lots, what would prevent the winner from selling his privilege for its full (unearned) value under free exchange and omnipresent competition? To such problems as these, Individualist Anarchism offers no solution. It theorizes throughout on the assumption that one place in a country is as good as another.

Under a system of occupying ownership, rent would appear only in its primary form of an excess of the prices of articles over the expenses of producing them, thus enabling owners of superior land to get more for their products than cost price. If, for example, the worst land worth using were only one-third as productive as the best land, then the owner-occupiers of that best land would get in the market the labor cost of their wares three times over. This 200 per cent. premium would be just as truly ground rent as if it were paid openly as such to the Duke of Bedford or the Astors. It may be asked why prices must go up to the expenses of production on the very worst land. Why not ascertain and charge the average cost of production taking good and bad land together? * Simply because nothing short of the maximum labor cost would repay the owners of the worst land. In fact, the worst land would not be cultivated until the price had risen. The process would be as follows. Suppose the need of the population for wheat were satisfied by crops raised from the best available land only. Free competition in wheat-producing would then bring the price down to the labor cost or expenses of production. Now suppose an increase of population sufficient to overtax the wheat-supplying capacity of the best land. The supply falling short of the demand, the price of wheat would rise. When it had risen to the labor cost of production from land one degree inferior to the best, it would be worth while to cultivate that inferior land. When that new source came to be overtaxed by the still growing population, the price would rise again until it would repay the cost of raising wheat from land yet lower in fertility than the second grade. But these descents would in nowise diminish the fertility of the best land, from which wheat could be raised as cheaply as before, in spite of the rise in the price, which would apply to all the wheat in the market, no matter where raised. That is, the holders of the best land would gain a premium, rising steadily with the increase of population, exactly as the landlord now enjoys a steadily rising rent. † As the agricultural industry is in this respect

* This would of course be largely practicable under a Collectivist system.

† English readers need not baulk themselves here because of the late fall of agricultural rents in this country. Rent, in the economic sense, covers payment for the use of land for any purpose, agricultural or otherwise; and town rents have risen oppressively. A much more puzzling discrepancy between the facts and the theory is presented by the apparent absence of any upward tendency in the prices of general commodities. However, an article may be apparently no less cheap or even much cheaper than it was twenty years ago; and yet its price may have risen enormously relatively to its average cost of production, owing to the average cost of production having been reduced by machinery, higher organization of the labor of producing it, cheapened traffic with other countries, etc. Thus, in the cotton industry, machinery has multiplied each man's power of production eleven hundred times; and Sir Joseph Whitworth was quoted by the President of the Iron and Steel Institute some years ago as having declared that

typical of all industries, it will be seen now that the price does not rise because worse land is brought into cultivation, but that worse land is brought into cultivation by the rise of price. Or, to put it in another way, the price of the commodity does not rise because more labor has been devoted to its production, but more labor is devoted to its production because the price has risen. Commodities, in fact, have a price before they are produced; we produce them expressly to obtain that price; and we cannot alter it by merely spending more or less labor on them. It is natural for the laborer to insist that labor *ought to be* the measure of price, and that the *just* wage of labor is its average product; but the first lesson he has to learn in economics is that labor is not and never can be the measure of price under a competitive system. Not until the progress of Socialism replaces competitive production and distribution, with individual greed for its incentive, by Collectivist production and distribution, with fair play all round for its incentive, will the prices either of labor or commodities represent their just value.

Thus we see that "competition everywhere and always" fails to circumvent rent whilst the land is held by competing occupiers who are protected in the individual ownership of what they can raise from their several holdings. And "the great principle laid down by Adam Smith," formulated by Josiah Warren as "Cost is the proper limit of price," turns out—since in fact price is the limit of cost—to be merely a preposterous way of expressing the fact that under Anarchism that small fraction of the general wealth which was produced under the least favorable circumstances would at least fetch its cost, whilst all the rest would fetch a premium which would be nothing but privately appropriated rent with an Anarchist mask on.

We see also that such a phrase as "the natural wage of labor is its product" is a misleading one, since labor cannot produce subsistence except when exercised upon natural materials and aided by natural forces external to man. And when it is so produced, its value in exchange depends in nowise on the share taken by labor in its production, but solely to the demand for it in society. The economic problem of Socialism is the just distribution of the premium

a Nottingham lace machine can do the work formerly done by 8,000 lacemakers. The articles entitled "Great Manufacture of Little Things," in Cassell's *Technical Educator*, may be consulted for examples of this sort in the production of pins, pens, etc. Suppose, then, that an article which cost, on the average, fivepence to make in 1850, was then sold for sixpence. If it be now selling for threepence, it is apparently twice as cheap as it was. But if the cost of production has also fallen to three-halfpence, which is by no means an extravagant supposition, then the price, considered relatively to the cost of production, has evidently risen prodigiously, since it is now twice the cost, whereas the cost was formerly five-sixths of the price. In other words, the surplus, or rent, per article, has risen from $16\frac{2}{3}$ per cent. to 100 per cent., in spite of the apparent cheapening. This is the explanation of the fact that though the workers were probably never before so monstrously robbed as they are at present, it is quite possible for statisticians to prove that on the whole wages have risen and prices fallen. The worker, pleased at having only to pay threepence where he formerly paid sixpence, forgets that the share of his threepence that goes to an idler may be much larger than that which went out of each of the two threepences he paid formerly.

given to certain portions of the general product by the action of demand. As Individualist Anarchism not only fails to distribute these, but deliberately permits their private appropriation, Individualist Anarchism is the negation of Socialism, and is, in fact, Unsocialism carried as near to its logical completeness as any sane man dare carry it.

Communist Anarchism.

State Socialism and Anarchism, says Mr. Tucker, "are based on two principles, the history of whose conflict is almost equivalent to the history of the world since man came into it; and all intermediate parties, including that of the upholders of the existing society, are based upon a compromise between them." These principles are Authority—the State Socialist principle, and Liberty—the Anarchist principle. State Socialism is then defined as "the doctrine that all the affairs of men should be managed by the government, regardless of individual choice," whereas Anarchism is "the doctrine that all the affairs of men should be managed by individuals or voluntary associations, and that the State should be abolished."

Now most revolutionists will admit that there was a stage in the growth of their opinions when the above seemed an adequate statement of the alternatives before them. But, as we have seen, when the Individualist Anarchist proceeds to reduce his principle to practice, he is inevitably led to Mr. Tucker's program of "competition everywhere and always" among occupying owners, subject only to the moral law of minding their own business. No sooner is this formulated than its effect on the distribution of wealth is examined by the economist, who finds no trouble in convicting it, under the economic law of rent, of privilege, monopoly, inequality, unjust indirect taxation, and everything that is most repugnant to Anarchism. But this startling reverse, however it may put the Anarchist out of conceit with his program, does not in the least reconcile him to State Socialism. It only changes his mind on one point. Whilst his program satisfied him, he was content to admit that State Socialism was the only possible alternative to Individualist Anarchism—nay, he rather insisted on it, because the evils of the State Socialist alternative were strong incentives to the acceptance of the other. But the moment it becomes apparent that the one is economically as bad as the other, the disillusioned Individualist Anarchist becomes convinced of the insufficiency of his analysis of the social problem, and follows it up in order to find out a *tertium quid*, or third system which shall collect and justly distribute the rent of the country, and yet prevent the collecting and distributing organ from acquiring the tyrannous powers of governments as we know them. There are two such systems at present before the world: Communism and Social-Democracy. Now there is no such thing as Anarchist Social-Democracy; but there is such a thing as Anarchist Communism or Communist Anarchism. It is true that Mr. Tucker does not recognize the Communist Anarchist as an Anarchist at all: he energetically repudiates Communism as the

uttermost negation of true Anarchism, and will not admit any logical halting place between thoroughgoing State Socialism and thoroughgoing Individualist Anarchism. But why insist on anybody occupying a logical halting place? We are all fond of shewing that on any given subject there are only two of these safe spots, one being the point of agreement with us, and the other some inconceivable extremity of idiocy. But for the purposes of the present criticism it will be more practical to waive such crude rationalizing, and concede that to deal with Mr. Tucker without also dealing with Peter Kropotkin is not to give Anarchism fair play.

The main difficulty in criticising Kropotkin lies in the fact that, in the distribution of generally needed labor products, his Communism is finally cheap and expedient, whereas Mr. Tucker's Individualism, in the same department, is finally extravagant and impossible. Even under the most perfect Social-Democracy we should, without Communism, still be living like hogs, except that each hog would get his fair share of grub. High as that ideal must seem to anyone who complacently accepts the present social order, it is hardly high enough to satisfy a man in whom the social instinct is well developed. So long as vast quantities of labor have to be expended in weighing and measuring each man's earned share of this and that commodity—in watching, spying, policing, and punishing in order to prevent Tom getting a crumb of bread more or Dick a spoonful of milk less than he has a voucher for, so long will the difference between Unsocialism and Socialism be only the difference between unscientific and scientific hoggishness. I do not desire to understate the vastness of that difference. Whilst we are hogs, let us at least be well-fed, healthy, reciprocally useful hogs, instead of—well, instead of the sort we are at present. But we shall not have any great reason to stand on the dignity of our humanity until a just distribution of the loaves and fishes becomes perfectly spontaneous, and the great effort and expense of a legal distribution, however just, is saved. For my own part, I seek the establishment of a state of society in which I shall not be bothered with a ridiculous pocketful of coppers, nor have to waste my time in perplexing arithmetical exchanges of them with booking clerks, bus conductors, shopmen, and other superfluous persons before I can get what I need. I aspire to live in a community which shall be at least capable of averaging the transactions between us well enough to ascertain how much work I am to do for it in return for the right to take what I want of the commoner necessities and conveniences of life. The saving of friction by such an arrangement may be guessed from the curious fact that only specialists in sociology are conscious of the numerous instances in which we are to-day forced to adopt it by the very absurdity of the alternative. Most people will tell you that Communism is known only in this country as a visionary project advocated by a handful of amiable cranks. Then they will stroll off across the common bridge, along the common embankment, by the light of the common gas lamp shining alike on the just and the unjust, up the common street, and into the common Trafalgar Square, where, on

the smallest hint on their part that Communism is to be tolerated for an instant in a civilized country, they will be handily bludgeoned by the common policeman, and haled off to the common gaol.* When you suggest to these people that the application of Communism to the bread supply is only an extension, involving no new principle, of its application to street lighting, they are bewildered. Instead of picturing the Communist man going to the common store, and thence taking his bread home with him, they instinctively imagine him bursting obstreperously into his neighbor's house and snatching the bread off his table on the "as much mine as yours" principle—which, however, has an equally sharp edge for the thief's throat in the form "as much yours as mine." In fact, the average Englishman is only capable of understanding Communism when it is explained as a state of things under which everything is paid for out of the taxes, and taxes are paid in labor. And even then he will sometimes say, "How about the brainwork?" and begin the usual novice's criticism of Socialism in general.

Now a Communist Anarchist may demur to such a definition of Communism as I have just given; for it is evident that if there are to be taxes, there must be some authority to collect those taxes. I will not insist on the odious word taxes; but I submit that if any article—bread, for instance—be communized, by which I mean that there shall be public stores of bread, sufficient to satisfy everybody, to which all may come and take what they need without question or payment, wheat must be grown, mills must grind, and bakers must sweat daily in order to keep up the supply. Obviously, therefore, the common bread store will become bankrupt unless every consumer of the bread contributes to its support as much labor as the bread he consumes costs to produce. Communism or no Communism, he must pay or else leave somebody else to pay for him. Communism will cheapen bread for him—will save him the cost of scales and weights, coin, book-keepers, counter-hands, policemen, and other expenses of private property; but it will not do away with the cost of the bread and the store. Now supposing that voluntary co-operation and public spirit prove equal to the task of elaborately organizing the farming, milling and baking industries for the production of bread, how will these voluntary co-operators recover the cost of their operations from the public who are to consume their bread? If they are given powers to collect the cost from the public, and to enforce their demands by punishing non-payers for their dishonesty, then they at once become a State department levying a tax for public purposes; and the Communism of the bread supply becomes no more Anarchistic than our present Communistic supply of street lighting is Anarchistic. Unless the taxation is voluntary—unless the bread consumer is free to refuse payment without incurring any penalty save the reproaches of his conscience and his neighbors, the Anarchist ideal will remain unattained. Now the pressure of conscience and

* Written in the 1887-92 period, during which Trafalgar Square was forcibly closed against public meetings by the Salisbury administration.

public opinion is by no means to be slighted. Millions of men and women, without any legal compulsion whatever, pay for the support of institutions of all sorts, from churches to tall hats, simply out of their need for standing well with their neighbors. But observe, this compulsion of public opinion derives most of its force from the difficulty of getting the wherewithal to buy bread without a reputation for respectability. Under Communism a man could snap his fingers at public opinion without starving for it. Besides, public opinion cannot for a moment be relied upon as a force which operates uniformly as a compulsion upon men to act morally. Its operation is for all practical purposes quite arbitrary, and is as often immoral as moral. It is just as hostile to the reformer as to the criminal. It hangs Anarchists and worships Nitrate Kings. It insists on a man wearing a tall hat and going to church, on his marrying the woman he lives with, and on his pretending to believe whatever the rest pretend to believe; and it enforces these ordinances in a sufficient majority of cases without help from the law: its tyranny, in fact, being so crushing that its little finger is often found to be thicker than the law's loins. But there is no sincere public opinion that a man should work for his daily bread if he can get it for nothing. Indeed it is just the other way: public opinion has been educated to regard the performance of daily manual labor as the lot of the despised classes. The common aspiration is to acquire property and leave off working. Even members of the professions rank below the independent gentry, so called because they are independent of their own labor. These prejudices are not confined to the middle and upper classes: they are rampant also among the workers. The man who works nine hours a day despises the man who works sixteen. A country gentleman may consider himself socially superior to his solicitor or his doctor; but they associate on much more cordial terms than shopmen and carmen, engine drivers and railway porters, bricklayers and hodmen, barmaids and general servants. One is almost tempted in this country to declare that the poorer the man the greater the snob, until you get down to those who are so oppressed that they have not enough self-respect even for snobbery, and thus are able to pluck out of the heart of their misery a certain irresponsibility which it would be a mockery to describe as genuine frankness and freedom. The moment you rise into the higher atmosphere of a pound a week, you find that envy, ostentation, tedious and insincere ceremony, love of petty titles, precedences and dignities, and all the detestable fruits of inequality of condition, flourish as rankly among those who lose as among those who gain by it. In fact, the notion that poverty favors virtue was clearly invented to persuade the poor that what they lost in this world they would gain in the next.

Kropotkine, too optimistically, as I think, disposes of the average man by attributing his unsocialism to the pressure of the corrupt system under which he groans. Remove that pressure, and he will think rightly, says Kropotkine. But if the natural man be indeed social as well as gregarious, how did the corruption and oppression

under which he groans ever arise? Could the institution of property as we know it ever have come into existence unless nearly every man had been, not merely willing, but openly and shamelessly eager to quarter himself idly on the labor of his fellows, and to domineer over them whenever the mysterious workings of economic law enabled him to do so? It is useless to think of man as a fallen angel. If the fallacies of absolute morality are to be admitted in the discussion at all, he must be considered rather as an obstinate and selfish devil, who is being slowly forced by the iron tyranny of Nature to recognize that in disregarding his neighbor's happiness he is taking the surest way to sacrifice his own. And under the present system he never can learn that lesson thoroughly, because he is an inveterate gambler, and knows that the present system gives him a chance, at odds of a hundred thousand to one or so against him, of becoming a millionaire, a condition which is to him the summit of earthly bliss, as from it he will be able to look down upon those who formerly bullied and patronized him. All this may sound harsh, especially to those who know how wholesomely real is the workman's knowledge of life compared to that of the gentleman, and how much more genuinely sympathetic he is in consequence. Indeed, it is obvious that if four-fifths of the population were habitually to do the utter worst in the way of selfishness that the present system invites them to do, society would not stand the strain for six weeks. So far, we can claim to be better than our institutions. But the fact that we are too good for complete Unsociatism by no means proves that we are good enough for Communism. The practical question remains, Could men trained under our present system be trusted to pay for their food scrupulously if they could take it for nothing with impunity? Clearly, if they did not so pay, Anarchist Communism would be bankrupt in two days. The answer is that all the evils against which Anarchism is directed are caused by men taking advantage of the institution of property to do this very thing—seize their subsistence without working for it. What reason is there for doubting that they would attempt to take exactly the same advantage of Anarchist Communism? And what reason is there to doubt that the community, finding its bread store bankrupt, would instantly pitch its Anarchism to the four winds, and come down on the defaulters with the strong hand of a law to make them pay, just as they are now compelled to pay their Income Tax? I submit, then, to our Communist Anarchist friends that Communism requires either external compulsion to labor, or else a social morality which the evils of existing society shew that we have failed as yet to attain. I do not deny the possibility of the final attainment of that degree of moralization; but I contend that the path to it lies through a transition system which, instead of offering fresh opportunities to men of getting their living idly, will destroy those opportunities altogether, and wean us from the habit of regarding such an anomaly as possible, much less honorable.

It must not be supposed that the economic difficulties which I pointed out as fatal to Individualist Anarchism are entirely removed by Communism. It is true that if all the bread and coal in the country were thrown into a common store from which each man could take as much as he wanted whenever he pleased without direct payment, then no man could gain any advantage over his fellows from the fact that some farms and some coal-mines are better than others. And if every man could step into a train and travel whither he would without a ticket, no individual could speculate in the difference between the traffic from Charing Cross to the Mansion House and that from Ryde to Ventnor. One of the great advantages of Communism will undoubtedly be that huge masses of economic rent will be socialized by it automatically. All rent arising from the value of commodities in general use which can be produced, consumed, and replaced at the will of man to the full extent to which they are wanted, can be made rent free by communizing them. But there must remain outside this solution, first, the things which are not in sufficiently general use to be communized at all; second, things of which an unlimited free supply might prove a nuisance, such as gin or printing; and thirdly, things for which the demand exceeds the supply. The last is the instance in which the rent difficulty recurs. It would take an extraordinary course of demolition, reconstruction, and landscape gardening to make every dwelling house in London as desirable as a house in Park Lane, or facing Regent's Park, or overlooking the Embankment Gardens. And since everybody cannot be accommodated there, the exceptionally favored persons who occupy those sites will certainly be expected to render an equivalent for their privilege to those whom they exclude. Without this there would evidently be no true socialization of the habitation of London. This means, in practice, that a public department must let the houses out to the highest bidders, and collect the rents for public purposes. Such a department can hardly be called Anarchistic, however democratic it may be. I might go on to enlarge considerably on the limits to the practicability of direct Communism, which varies from commodity to commodity; but one difficulty, if insurmountable, is as conclusive as twenty.

It is sufficient for our present purpose to have shewn that Communism cannot be ideally Anarchistic, because it does not in the least do away with the necessity for *compelling* people to pay for what they consume; and even when the growth of human character removes that difficulty there will still remain the question of those commodities to which the simple Communist method of so-called "free distribution" is inapplicable. One practical point more requires a word; and that is the difficulty of communizing any branch of distribution without first collectivizing it. For instance, we might easily communize the postal service by simply announcing that in future letters would be carried without stamps just as they now are with them, the cost being thrown entirely upon imperial taxation. But if the postal service were, like most of our distributive business, in the hands of thousands of competing private traders, no such

change would be directly possible. Communism must grow out of Collectivism, not out of anarchic private enterprise. That is to say, it cannot grow directly out of the present system.

But must the transition system therefore be a system of despotic coercion? If so, it will be wrecked by the intense impulse of men to escape from the domination of their own kind. In 1888 a Russian subject, giving evidence before the Sweating Inquiry in the House of Lords, declared that he left the Russian dominion, where he worked thirteen hours a day, to work eighteen hours in England, *because he is freer here*. Reason is dumb when confronted with a man who, exhausted with thirteen hours' toil, will turn to for another five hours for the sake of being free to say that Mr. Gladstone is a better man than Lord Salisbury, and to read Mill, Spencer, and *Reynold's Newspaper* in the six hours left to him for sleep. It brings to mind the story of the American judge who tried to induce a runaway slave to return to the plantation by pointing out how much better he was treated there than the free wage-nigger of the Abolitionist states. "Yes," said the runaway; "but would you go back if you were in my place?" The judge turned Abolitionist at once. These things are not to be reasoned away. Man will submit to fate, circumstance, society, anything that comes impersonally over him; but against the personal oppressor, whether parent, schoolmaster, overseer, official chief, or king, he eternally rebels. Like the Russian, he will rather be compelled by "necessity" to *agree to work eighteen hours*, than ordered by a master to work thirteen. No modern nation, if deprived of personal liberty or national autonomy, would stop to think of its economic position. Establish a form of Socialism which shall deprive the people of their sense of personal liberty; and, though it double their rations and halve their working hours, they will begin to conspire against it before it is a year old. We only disapprove of monopolists: we *hate* masters.

Then, since we are too dishonest for Communism without taxation or compulsory labor, and too insubordinate to tolerate task work under personal compulsion, how can we order the transition so as to introduce just distribution without Communism, and maintain the incentive to labor without mastership? The answer is, by Democracy. And now, having taken a positive attitude at last, I must give up criticizing the Anarchists, and defend Democracy against *their* criticisms.

Democracy.

I now, accordingly, return to Mr. Tucker's criticism of State Socialism, which, for the sake of precision, had better be called Social-Democracy. There is a Socialism—that of Bismarck; of the extinct young England party; of the advocates of moralized feudalism; and of mob contempters generally—which is not Social-Democracy, but Social-Despotism, and may be dismissed as essentially no more hopeful than a system of Moralized Criminality, Abstemious Gluttony, or Straightforward Mendacity would be. Mr. Tucker, as an American, passes it over as not worth powder and shot: he clearly indicates

a democratic State by his repeated references to the majority principle, and in particular by his assertion that "there would be but one article in the constitution of a State Socialistic country: 'The right of the majority is absolute.'" Having thus driven Democracy back on its citadel, he proceeds to cannonade it as follows:

"Under the system of State Socialism, which holds the community responsible for the health, wealth and wisdom of the individual, the community, through its majority expression, will insist more and more on prescribing the conditions of health, wealth, and wisdom, thus impairing and finally destroying individual independence and with it all sense of individual responsibility.

"Whatever, then, the State Socialists may claim or disclaim, their system, if adopted, is doomed to end in a State religion, to the expense of which all must contribute and at the altar of which all must kneel; a State school of medicine, by whose practitioners the sick must invariably be treated; a State system of hygiene, prescribing what all must and must not eat, drink, wear and do; a State code of morals, which will not content itself with punishing crime, but will prohibit what the majority decide to be vice; a State system of instruction, which shall do away with all private schools, academies and colleges; a State nursery, in which all children must be brought up in common at the public expense; and, finally, a State family, with an attempt at stirpiculture, or scientific breeding, in which no man or woman will be allowed to have children if the State prohibits them, and no man or woman can refuse to have children if the State orders them. Thus will Authority achieve its acme and Monopoly be carried to its highest power."

In reading this one is reminded of Mr. Herbert Spencer's habit of assuming that whatever is not white must be black. Mr. Tucker, on the ground that "it has ever been the tendency of power to add to itself, to enlarge its sphere, to encroach beyond the limits set for it," admits no alternative to the total subjection of the individual, except the total abolition of the State. If matters really could and did come to that I am afraid the individual would have to go under in any case; for the total abolition of the State in this sense means the total abolition of the collective force of Society, to abolish which it would be necessary to abolish Society itself. There are two ways of doing this. One, the abolition of the individuals composing society, could not be carried out without an interference with their personal claims much more serious than that required, even on Mr. Tucker's shewing, by Social-Democracy. The other, the dispersion of the human race into independent hermitages over the globe at the rate of twenty-five to the square mile, would give rise to considerable inequality of condition and opportunity as between the hermits of Terra del Fuego or the Arctic regions and those of Florida or the Riviera, and would suit only a few temperaments. The dispersed units would soon re-associate; and the moment they did so, good-bye to the sovereignty of the individual. If the majority believed in an angry and jealous God, then, State or no State, they would not permit an individual to offend that God and bring down his wrath upon them: they would rather stone and burn the individual in propitiation. They would not suffer the individual to go naked among them; and if he clothed himself in an unusual way which struck them as being ridiculous or scandalous, they would laugh at him; refuse him admission to their feasts; object to be seen talking with him in the streets; and perhaps lock him up as a lunatic. They would

not allow him to neglect sanitary precautions which they believed essential to their own immunity from zymotic disease. If the family were established among them as it is established among us, they would not suffer him to intermarry within certain degrees of kinship. Their demand would so rule the market that in most places he would find no commodities in the shops except those preferred by a majority of the customers; no schools except those conducted in accordance with the ideas of the majority of parents; no experienced doctors except those whose qualifications inspired confidence in a whole circle of patients. This is not "the coming slavery" of Social-Democracy: it is the slavery already come. What is more, there is nothing in the most elaborately negative practical program yet put forward by Anarchism that offers the slightest mitigation of it. That in comparison with ideal irresponsible absolute liberty it is slavery, cannot be denied. But in comparison with the slavery of Robinson Crusoe, which is the most Anarchistic alternative Nature, our taskmistress, allows us, it is pardonably described as "freedom." Robinson Crusoe, in fact, is always willing to exchange his unlimited rights and puny powers for the curtailed rights and relatively immense powers of the "slave" of majorities. For if the individual chooses, as in most cases he will, to believe and worship as his fellows do, he finds temples built and services organized at a cost to himself which he hardly feels. The clothes, the food, the furniture which he is most likely to prefer are ready for him in the shops; the schools in which his children can be taught what their fellow citizens expect them to know are within fifteen minutes' walk of his door; and the red lamp of the most approved pattern of doctor shines reassuringly at the corner of the street. He is free to live with the women of his family without suspicion or scandal; and if he is not free to marry them, what does that matter to him, since he does not wish to marry them? And so happy man be his dole, in spite of his slavery.

"Yes," cries some eccentric individual; "but all this is untrue of me. I want to marry my deceased wife's sister. I am prepared to prove that your authorized system of medicine is nothing but a debased survival of witchcraft. Your schools are machines for forcing spurious learning on children in order that your universities may stamp them as educated men when they have finally lost all power to think for themselves. The tall silk hats and starched linen shirts which you force me to wear, and without which I cannot successfully practice as a physician, clergyman, schoolmaster, lawyer, or merchant, are inconvenient, unsanitary, ugly, pompous, and offensive. Your temples are devoted to a God in whom I do not believe; and even if I did believe in him I should still regard your popular forms of worship as only redeemed from gross superstition by their obvious insincerity. Science teaches me that my proper food is good bread and good fruit: your boasted food supply offers me cows and pigs instead. Your care for my health consists in tapping the common sewer, with its deadly typhoid gases, into my house, besides discharging its contents into the river, which is my natural bath and fountain. Under color of protecting my person.

and property you forcibly take my money to support an army of soldiers and policemen for the execution of barbarous and detestable laws; for the waging of wars which I abhor; and for the subjection of my person to those legal rights of property which compel me to sell myself for a wage to a class the maintenance of which I hold to be the greatest evil of our time. Your tyranny makes my very individuality a hindrance to me: I am outdone and outbred by the mediocre, the docile, the time-serving. Evolution under such conditions means degeneracy: therefore I demand the abolition of all these officious compulsions, and proclaim myself an Anarchist."

The proclamation is not surprising under the circumstances; but it does not mend the matter in the least, nor would it if every person were to repeat it with enthusiasm, and the whole people to fly to arms for Anarchism. The majority cannot help its tyranny even if it would. The giant Winkelmeier must have found our doorways inconvenient, just as men of five feet or less find the slope of the floor in a theatre not sufficiently steep to enable them to see over the heads of those in front. But whilst the average height of a man is 5ft. 6in. there is no redress for such grievances. Builders will accommodate doors and floors to the majority, and not to the minority. For since either the majority or the minority must be incommoded, evidently the more powerful must have its way. There may be no indisputable reason why it ought; and any clever Tory can give excellent reasons why it ought not; but the fact remains that it will, whether it ought or not. And this is what really settles the question as between democratic majorities and minorities. Where their interests conflict, the weaker side must go to the wall, because, as the evil involved is no greater than that of the stronger going to the wall,* the majority is not restrained by any scruple from compelling the weaker to give way.

In practice, this does not involve either the absolute power of majorities, or "the infallibility of the odd man." There are some matters in which the course preferred by the minority in no way obstructs that preferred by the majority. There are many more in which the obstruction is easier to bear than the cost of suppressing it. For it costs something to suppress even a minority of one. The commonest example of that minority is the lunatic with a delusion; yet it is found quite safe to entertain dozens of delusions, and be generally an extremely selfish and troublesome idiot, in spite of the power of majorities; for until you go so far that it clearly costs less to lock you up than to leave you at large, the majority will not take the trouble to set itself in action against you. Thus a minimum of individual liberty is secured, under any system, to the smallest

* The evil is decidedly *less* if the calculation proceeds by the popular method of always estimating an evil suffered by a hundred persons as a hundred times as great as the same evil suffered by only one. This, however, is absurd. A hundred starving men are not a hundred times as hungry as one starving man, any more than a hundred five-foot-eight men are each five hundred and sixty-six feet eight inches high. But they are a hundred times as strong a political force. Though the evil may not be cumulative, the power to resist it is.

minority. It is true that as minorities grow, they sometimes, in forfeiting the protection of insignificance, lose more in immunity than they gain in numbers ; so that probably the weakest minority is not the smallest, but rather that which is too large to be disregarded and too weak to be feared ; but before and after that dangerous point is weathered, minorities wield considerable power. The notion that they are ciphers because the majority could vanquish them in a trial of strength leaves out of account the damage they could inflict on the victors during the struggle. Ordinarily an unarmed man weighing thirteen stone can beat one weighing only eleven ; but there are very few emergencies in which it is worth his while to do it, because if the weaker man resists to the best of his ability (which is always possible) the victor will be considerably worse off after the fight than before it. In 1861 the Northern and Southern States of America fought, as prize-fighters say, "to a finish" ; and the North carried its point, yet at such a heavy cost to itself that the Southern States have by no means been reduced to ciphers ; for the victorious majority have ever since felt that it would be better to give way on any but the most vital issues than to provoke such another struggle. But it is not often that a peremptory question arises between a majority and minority of a whole nation. In most matters only a fragment of the nation has any interest one way or the other ; and the same man who is in a majority on one question is in a minority on another, and so learns by experience that minorities have "rights" which must be attended to. Minorities, too, as in the case of the Irish Party in the English Parliament, occasionally hold the balance of power between majorities which recognize their rights and majorities which deny them. Further, it is possible by decentralization to limit the power of the majority of the whole nation to questions upon which a divided policy is impracticable. For example, it is not only possible, but democratically expedient, to federate the municipalities of England in such a manner that Leicester might make vaccination penal whilst every other town in the island made it compulsory. Even at present, vaccination is not in fact compulsory in Leicester, though it is so in law. Theoretically, Leicester has been reduced to a cipher by the rest of England. Practically, Leicester counts twelve to the dozen as much as ever in purely local affairs.

In short, then, Democracy does not give majorities absolute power, nor does it enable them to reduce minorities to ciphers. Such limited power of coercing minorities as majorities must possess, is not given to them by Democracy any more than it can be taken away from them by Anarchism. A couple of men are stronger than one : that is all. There are only two ways of neutralizing this natural fact. One is to convince men of the immorality of abusing the majority power, and then to make them moral enough to refrain from doing it on that account. The other is to realize Lytton's fancy of *vril* by inventing a means by which each individual will be able to destroy all his fellows with a flash of thought, so that the majority may have as much reason to fear the individual as he to fear the majority. No method of doing either is to be found in Indivi-

dualist or Communist Anarchism: consequently these systems, as far as the evils of majority tyranny are concerned, are no better than the Social-Democratic program of adult suffrage with maintenance of representatives and payment of polling expenses from public funds—faulty devices enough, no doubt, but capable of accomplishing all that is humanly possible at present to make the State representative of the nation; to make the administration trustworthy; and to secure the utmost power to each individual and consequently to minorities. What better can we have whilst collective action is inevitable? Indeed, in the mouths of the really able Anarchists, Anarchism means simply the utmost attainable thoroughness of Democracy. Kropotkin, for example, speaks of free development from the simple to the composite by “the free union of free groups”; and his illustrations are “the societies for study, for commerce, for pleasure and recreation” which have sprung up to meet the varied requirements of the individual of our age. But in every one of these societies there is government by a council elected annually by a majority of voters; so that Kropotkin is not at all afraid of the democratic machinery and the majority power. Mr. Tucker speaks of “voluntary association,” but gives no illustrations, and indeed avows that “Anarchists are simply unterrified Jeffersonian Democrats.” He says, indeed, that “if the individual has a right to govern himself, all external government is tyranny”; but if governing oneself means doing what one pleases without regard to the interests of neighbors, then the individual has flatly no such right. If he has no such right, the interference of his neighbors to make him behave socially, though it is “external government,” is not tyranny; and even if it were they would not refrain from it on that account. On the other hand, if governing oneself means compelling oneself to act with a due regard to the interests of the neighbors, then it is a right which men are proved incapable of exercising without external government. Either way, the phrase comes to nothing; for it would be easy to show by a little play upon it, either that altruism is really external government or that democratic State authority is really self-government.

Mr. Tucker's adjective, “voluntary,” as applied to associations for defence or the management of affairs, must not be taken as implying that there is any very wide choice open in these matters. Such association is really compulsory, since if it be foregone affairs will remain unmanaged and communities defenceless. Nature makes short work of our aspirations towards utter impunity. She leaves communities in no wise “free” to choose whether they will labor and govern themselves. It is either that or starvation and chaos. Her tasks are inexorably set: her penalties are inevitable: her payment is strictly “payment by results.” All the individual can do is to shift and dodge his share of the task on to the shoulders of others, or filch some of their “natural wage” to add to his own. If they are fools enough to suffer it, that is their own affair as far as Nature is concerned. But it is the aim of Social-Democracy to relieve these fools by throwing on all an equal share in the inevitable labor im-

posed by the eternal tyranny of Nature, and so secure to every individual no less than his equal quota of the nation's product in return for no more than his equal quota of the nation's labor. These are the best terms humanity can make with its tyrant. In the eighteenth century it was easy for the philosophers and for Adam Smith to think of this rule of Nature as being "natural liberty" in contrast to the odious and stupid oppression of castes, priests, and kings—the detested "dominion of man over man." But we, in detecting the unsoundness of Adam Smith's private property and *laissez-faire* recipe for natural liberty, begin to see that though there is political liberty, there is no natural liberty, but only natural law remorselessly enforced. And so we shake our heads when we see LIBERTY on the title-page of Mr. Tucker's paper, just as we laugh when we see THE COMING SLAVERY on Mr. Herbert Spencer's "Man and the State."

We can now begin to join the threads of our discussion. We have seen that private appropriation of land in any form, whether limited by Individualist Anarchism to occupying owners or not, means the unjust distribution of a vast fund of social wealth called rent, which can by no means be claimed as due to the labor of any particular individual or class of individuals. We have seen that Communist Anarchism, though it partly—and only partly—avoids the rent difficulty, is, in the condition of morals developed under existing Unsocialism, impracticable. We have seen that the delegation of individual powers by voting; the creation of authoritative public bodies; the supremacy of the majority in the last resort; and the establishment and even endowment, either directly and officially or indirectly and unconsciously, of conventional forms of practice in religion, medicine, education, food, clothing, and criminal law, are, whether they be evils or not, inherent in society itself, and must be submitted to with the help of such protection against their abuse as democratic institutions more than any others afford. When Democracy fails, there is no antidote for intolerance save the spread of better sense. No form of Anarchism yet suggested provides any escape. Like bad weather in winter, intolerance does much mischief; but as, when we have done our best in the way of overcoats, umbrellas, and good fires, we have to put up with the winter; so, when we have done our best in the way of Democracy, decentralization, and the like, we must put up with the State.

The Anarchist Spirit.

I suppose I must not leave the subject without a word as to the value of what I will call the Anarchist spirit as an element in progress. But before I do so, let me disclaim all intention of embarrassing our Anarchist friends who are present by any sympathy which I may express with that spirit. On the Continent the discussion between Anarchism and Social-Democracy is frequently threshed out with the help of walking-sticks, chair-legs, and even revolvers. In England this does not happen, because the majority of an English audience always declines to take an extreme position,

and, out of an idle curiosity to hear both sides, will, on sufficient provocation, precipitately eject theorists who make a disturbance, without troubling itself to discriminate as to the justice of their views. When I had the privilege some time ago of debating publicly with Mr. G. W. Foote on the Eight Hours question, a French newspaper which dealt with the occasion at great length devoted a whole article to an expression of envious astonishment at the fact that Mr. Foote and I abstained from vilifying and finally assaulting one another, and that our partisans followed our shining example and did not even attempt to prevent each other's champions from being heard. Still, if we do not permit ourselves to merge Socialism, Anarchism, and all the other isms into rowdyism, we sometimes debate our differences, even in this eminently respectable Fabian Society, with considerable spirit. Now far be it from me to disarm the Anarchist debater by paying him compliments. On the contrary, if we have here any of those gentlemen who make it their business to denounce Social-Democrats as misleaders of the people and trimmers; who declaim against all national and municipal projects, and clamor for the abolition of Parliaments and County Councils; who call for a desperate resistance to rent, taxes, representative government and organised collective action of every sort: then I invite them to regard me as their inveterate opponent—as one who regards such doctrine, however sincerely it may be put forward, as at best an encouragement to the workers to neglect doing what is possible under pretext of waiting for the impossible, and at worst as furnishing the reactionary newspapers in England, and the police agents on the Continent, with evidence as to the alleged follies and perils of Socialism. But at the same time, it must be understood that I do not stand here to defend the State as we know it. Bakounine's comprehensive aspiration to destroy all States and Established Churches, with their religious, political, judicial, financial, criminal, academic, economic and social laws and institutions, seems to me perfectly justifiable and intelligible from the point of view of the ordinary "educated man," who believes that institutions make men instead of men making institutions. I fully admit and vehemently urge that the State at present is simply a huge machine for robbing and slave-driving the poor by brute force. You may, if you are a stupid or comfortably-off person, think that the policeman at the corner is the guardian of law and order—that the gaol, with those instruments of torture, the treadmill, plank bed, solitary cell, cat o' nine tails, and gallows, is a place to make people cease to do evil and learn to do well. But the primary function of the policeman, and that for which his other functions are only blinds, is to see that you do not lie down to sleep in this country without paying an idler for the privilege; that you do not taste bread until you have paid the idler's toll in the price of it; that you do not resist the starving blackleg who is dragging you down to his level for the idler's profit by offering to do your work for a starvation wage. Attempt any of these things, and you will be haled off and tortured in the name of law and order, honesty, social equilibrium, safety of pro-

perty and person, public duty, Christianity, morality, and what not, as a vagrant, a thief, and a rioter. Your soldier, ostensibly a heroic and patriotic defender of his country, is really an unfortunate man driven by destitution to offer himself as food for powder for the sake of regular rations, shelter and clothing; and he must, on pain of being arbitrarily imprisoned, punished with petty penances like a naughty child, pack-drilled, flogged or shot, all in the blessed name of "discipline," do anything he is ordered to, from standing in his red coat in the hall of an opera house as a mere ornament, to flogging his comrade or committing murder. And *his* primary function is to come to the rescue of the policeman when the latter is overpowered. Members of Parliament whose sole qualifications for election were £1000 loose cash, an "independent" income, and a vulgar strain of ambition; parsons quoting scripture for the purposes of the squire; lawyers selling their services to the highest bidder at the bar, and maintaining the supremacy of the moneyed class on the bench; juries of employers masquerading as the peers of proletarians in the dock; University professors elaborating the process known as the education of a gentleman; artists striving to tickle the fancy or flatter the vanity of the aristocrat or plutocrat; workmen doing their work as badly and slowly as they dare so as to make the most of their job; employers starving and overworking their hands and adulterating their goods as much as *they* dare: these are the actual living material of those imposing abstractions known as the State, the Church, the Law, the Constitution, Education, the Fine Arts, and Industry. Every institution, as Bakounine saw, religious, political, financial, judicial, and so on, is corrupted by the fact that the men in it either belong to the propertied class themselves or must sell themselves to it in order to live. All the purchasing power that is left to buy men's souls with after their bodies are fed is in the hands of the rich; and everywhere, from the Parliament which wields the irresistible coercive forces of the bludgeon, bayonet, machine gun, dynamite shell, prison and scaffold, down to the pettiest centre of shabby-genteel social pretension, the rich pay the piper and call the tune. Naturally, they use their power to steal more money to continue paying the piper; and thus all society becomes a huge conspiracy and hypocrisy. The ordinary man is insensible to the fraud just as he is insensible to the taste of water, which, being constantly in contact with his mucous membrane, seems to have no taste at all. The villainous moral conditions on which our social system is based are necessarily in constant contact with our moral mucous membrane, and so we lose our sense of their omnipresent meanness and dishonor. The insensibility, however, is not quite complete; for there is a period in life which is called the age of disillusion, which means the age at which a man discovers that his generous and honest impulses are incompatible with success in business; that the institutions he has revered are shams; and that he must join the conspiracy or go to the wall, even though he feels that the conspiracy is fundamentally ruinous to himself and his fellow-conspirators. The secret of writers like Ruskin, Morris and Kropotkine

is that they see the whole imposture through and through, in spite of its familiarity, and of the illusions created by its temporal power, its riches, its splendor, its prestige, its intense respectability, its unrelenting piety, and its high moral pretension. But Kropotkin, as I have shown, is really an advocate of free Democracy; and I venture to suggest that he describes himself as an Anarchist rather from the point of view of the Russian recoiling from a despotism compared to which Democracy seems to be no government at all, than from the point of view of the American or Englishman who is free enough already to begin grumbling over Democracy as "the tyranny of the majority" and "the coming slavery." I suggest this with the more confidence because William Morris's views are largely identical with those of Kropotkin: yet Morris, after patient and intimate observation of Anarchism as a working propaganda in England, has definitely dissociated himself from it, and has shown, by his sketch of the communist folk-mote in his *News from Nowhere*, how sanely alive he is to the impossibility of any development of the voluntary element in social action sufficient to enable individuals or minorities to take public action without first obtaining the consent of the majority.

On the whole, then, I do not regard the extreme hostility to existing institutions which inspires Communist Anarchism as being a whit more dangerous to Social-Democracy than the same spirit as it inspires the peculiar Toryism of Ruskin. Much more definitely opposed to us is the survival of that intense jealousy of the authority of the government over the individual which was the mainspring of the progress of the eighteenth century. Only those who forget the lessons of history the moment they have served their immediate turn will feel otherwise than reassured by the continued vitality of that jealousy among us. But this consideration does not remove the economic objections which I have advanced as to the practical program of Individualist Anarchism. And even apart from these objections, the Social-Democrat is compelled, by contact with hard facts, to turn his back decisively on useless denunciation of the State. It is easy to say, Abolish the State; but the State will sell you up, lock you up, blow you up, knock you down, bludgeon, shoot, stab, hang—in short, abolish you, if you lift a hand against it. Fortunately, there is, as we have seen, a fine impartiality about the policeman and the soldier, who are the cutting edge of the State power. They take their wages and obey their orders without asking questions. If those orders are to demolish the homestead of every peasant who refuses to take the bread out of his children's mouths in order that his landlord may have money to spend as an idle gentleman in London, the soldier obeys. But if his orders were to help the police to pitch his lordship into Holloway Gaol until he had paid an Income Tax of twenty shillings on every pound of his unearned income, the soldier would do that with equal devotion to duty, and perhaps with a certain private zest that might be lacking in the other case. Now these orders come ultimately from the State—meaning, in this country, the House of Commons. A House

of Commons consisting of 660 gentlemen and 10 workmen will order the soldier to take money from the people for the landlords. A House of Commons consisting of 660 workmen and 10 gentlemen will probably, unless the 660 are fools, order the soldier to take money from the landlords for the people. With this hint I leave the matter, in the full conviction that the State, in spite of the Anarchists, will continue to be used against the people by the classes until it is used by the people against the classes with equal ability and equal resolution.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. 3d., post free 4d.

TRACT INDEX and CATALOGUE RAISONNÉ. 3d.

FABIAN ESSAYS IN SOCIALISM. New Preface by BERNARD SHAW. Paper 6d. net; cloth 1/6; postage 2½d. and 4d.

FABIAN TRACTS and LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 78, 3s.; post free 3/5. Bound in Buckram, 4/6 net; post free 5s.

I.—General Socialism in its various aspects.

TRACTS.—147. Capital and Compensation. By EDW. R. PEASE. 146. Socialism and Superior Brains. A reply to Mr. Mallock. By BERNARD SHAW. 142. Rent and Value. 138. Municipal Trading. 121. Public Service versus Private Expenditure. By Sir OLIVER LODGE. 113. Communism. By WM. MORRIS. 107. Socialism for Millionaires. By BERNARD SHAW. 139. Socialism and the Churches. By Rev. JOHN CLIFFORD, D.D. 133. Socialism and Christianity. By Rev. PERCY DEARMER (in cover with portrait of the author). 78. Socialism and the Teaching of Christ. By Dr. J. CLIFFORD. 42. Christian Socialism. By Rev. S. D. HEADLAM. 79. A Word of Remembrance and Caution to the Rich. By JOHN WOOLMAN. 75. Labor in the Longest Reign. By S. WEBB. 72. The Moral Aspects of Socialism. By SIDNEY BALL. 69. Difficulties of Individualism. By SIDNEY WEBB. 51. Socialism: True and False. By S. WEBB. 45. The Impossibilities of Anarchism. By BERNARD SHAW (price 2d.). 7. Capital and Land (7th edn. revised 1908). 5. Facts for Socialists (11th ed., revised 1908). LEAFLETS.—13. What Socialism Is. 1. Why are the Many Poor? WELSH TRACTS.—143. Sosialaeth yng Ngoleuni'r Beibl. Gan J. R. JONES (Caernarfon). 141. Translation of 139. 87. Translation of 78. 38. Translation of 1. 132. A Guide to Books for Socialists.

II.—Applications of Socialism to Particular Problems.

TRACTS.—150. State Purchase of Railways. By EMIL DAVIES. In cover, 2d. 149. The Endowment of Motherhood. By H. D. HARBEN. In cover, 2d. 145. The Case for School Nurseries. By MRS. TOWNSEND. 144. Machinery: its Masters and its Servants. By H. H. SCHLOESSER and C. GAME. 140. Child Labor under Capitalism. By MRS. HYLTON DALE. 136. The Village and the Landlord. By EDW. CARPENTER. 135. Paupers and Old Age Pensions. By SIDNEY WEBB. 131. The Decline in the Birth-Rate. By S. WEBB. 130. Home Work and Sweating. By Miss B. L. HUTCHINS. 128. The Case for a Legal Minimum Wage. 122. Municipal Milk and Public Health. By Dr. F. LAWSON DODD. 125. Municipalization by Provinces. 119. Public Control of Electrical Power and Transit. 123. The Revival of Agriculture. 118. The Secret of Rural Depopulation. 115. State Aid to Agriculture: an Example. 112. Life in the Laundry. 98. State Railways for Ireland. 124. State Control of Trusts. 86. Municipal Drink Traffic. 85. Liquor Licensing at Home and Abroad. 84. Economics of Direct Employment. 83. State Arbitration and the Living Wage. LEAFLET.—104. How Trade Unions benefit Workmen.

III.—Local Government Powers: How to use them.

TRACTS.—137. Parish Councils and Village Life. 109. Cottage Plans and Common Sense. By RAYMOND UNWIN. 76. Houses for the People. 99. Local Government in Ireland. 82. Workmen's Compensation Act. New edition for the Act of 1906. 62. Parish and District Councils. 54. The Humanizing of the Poor Law. By J. F. OAKESHOTT. LEAFLETS.—134. Small Holdings, Allotments and Common Pastures: and how to get them. 20. Questions for Poor Law Guardians. FABIAN MUNICIPAL PROGRAM, FIRST SERIES (Nos. 32, 37). Municipalization of the Gas Supply. A Labor Policy for Public Authorities. SECOND SERIES (Nos. 90 to 95). Municipalization of Milk Supply. Municipal Pawnshops. Municipal Slaughterhouses. Women as Councillors. Municipal Bakeries. Municipal Hospitals. Second Series in a red cover for 1d. (9d. per doz.); separate leaflets, 1/- per 100.

IV.—General Politics and Fabian Policy.

127. Socialism and Labor Policy. 116. Fabianism and the Fiscal Question: an alternative policy. 108. Twentieth Century Politics. By SIDNEY WEBB. 70. Report on Fabian Policy. 41. The Fabian Society, its Early History. By BERNARD SHAW.

Fabian Tract No. 51.

SOCIALISM: TRUE AND FALSE.

SOCIALISM: TRUE AND FALSE.*

I do not know whether many of those here present are aware that we celebrate to-night what may be regarded as the tenth anniversary of the foundation of this Society. It was on the 4th of January, 1884, that the little group which had been for some months discussing the Regeneration of the World and a Fellowship of the New Life, formally adopted the title of the Fabian Society—thereby indicating, as I take it, an underlying suspicion that the Devil of Individualism was not to be driven out by any short and sharp encounter, but that it behoved all true believers to watch and wait and diligently equip themselves for a warfare which must necessarily be harrassing and protracted. But though we took the title of the Fabian Society in January, 1884, it was two or three years before we had quite found out what our instinctive choice of a title really portended. In 1884 the Fabian Society, like the other Socialist organizations, had its enthusiastic young members—aye, and old ones, too—who placed all their hopes on a sudden tumultuous uprising of a united proletariat, before whose mighty onrush, kings, landlords and capitalists would go down like ninepins, leaving society quietly to re-sort itself into Utopia. The date for this Social Revolution was sometimes actually fixed for 1889, the centenary of the opening of the French Revolution. I remember myself that one of our friends, in his zeal that the rural districts might not be forgotten, printed and circulated a proposal that a few Socialist missionaries should buy a gipsy caravan and live in it “until the Revolution,” an event evidently to be expected before the ensuing winter!†

It was against all thinking and teaching of this catastrophic kind that the Society gradually came to set its face—not, as I believe, because we were any less in earnest in our warfare against existing evils, or less extreme in our remedies, but because we were sadly and sorrowfully driven to the conclusion that no sudden or simultaneous transformation of society from an Individualist to a Collectivist basis was possible, or even thinkable.‡

* A Lecture delivered to the Fabian Society, 21st January, 1894, by Sidney Webb.

† Out of enthusiasm of this sort has grown the extremely practical rural propaganda by means of travelling vans, now carried on by various societies. See the interesting annual reports of the “Red Van” campaigns of the English Land Restoration League for 1892 and 1893 (8 Duke Street, Adelphi, London).

‡ The process of education amid which the Fabian Society settled down to this view is described in Fabian Tract No. 41, *The Fabian Society: What it has done and how it has done it*, by G. Bernard Shaw.

On the other hand we had but little sympathy with schemes for the regeneration of mankind by the establishment of local Utopias, whether in Cumberland or in Chili. To turn our back on the Unearned Increment and the Machine Industry seemed a poor way of conquering them. We had no faith in the recuperative qualities of spade husbandry or in any devices for dodging the Law of Rent. In short, we repudiated the common assumption that Socialism was necessarily bound up with Insurrectionism on the one hand or Utopianism on the other, and we set to work to discover for ourselves and to teach to others how practically to transform England into a Social Democratic Commonwealth.

Well, we have I hope, all learnt a great deal since 1884, but everything that has happened during these ten years has strengthened our faith in the fundamental principles of our association. If I might speak in the name of our members, I should say that we are more than ever convinced of the utter impossibility of what may be called Catastrophic Socialism, and all its attendant heresies. Nor have we seen reason to alter our distrust of separate Socialist communities, in whatever specious new form the old idea may clothe itself. For ten years we have held on our course, turning neither to Insurrectionism on the one hand nor to Utopianism on the other.

If now I briefly recal to your mind some instances of the progress of Collectivist ideas during these years, I trust that no one will imagine that I am attempting to claim that progress as the work of the Fabian Society, or indeed of any society whatever. Nothing is more futile than to endeavor to ascribe the exact cause and origin of a general intellectual movement, of which we are, indeed, ourselves a product. The seeds of the Socialist harvest of the last few years were sown by the great thinkers and teachers of the last two generations; and it would be idle to attempt to measure the exact influence of any one of them in the transformation of ideas amid which we are now living.

I take as a starting point, not 1884, but the year 1880, which as I conceive, approximately marks the turning of thought.

Fourteen years ago we may almost say that an unsystematic and empirical Individualism reigned supreme. Not in one political party alone, or in one class of society, but in all alike, we find the assumption that the functions of government ought to be reduced to the barest minimum; that free competition, leading as it was supposed to the survival of the fittest, was the only sure foundation of a prosperous State; and that the incessant private "war which leads each man to strive to place himself on another's shoulders and to remain there,"* was, on the whole, a benevolent dispensation of Providence, and part of the "Laws of Nature," not impiously to be interfered with.

The Liberal Party, at that time almost exclusively dominated by the manufacturers and the Whig families, was living on the remnants of the political reputation of the Manchester School. A vague belief

* Sir Henry Maine, "Popular Government."

in the saving grace of non-intervention abroad and *laissez faire* at home, was vitalised only by a practical programme of the extension of household franchise to the counties. To the rising desire for social reform it presented no more hopeful solution than the economic negations of Nassau Senior and Fawcett. The object of all social reforms, authorised or unauthorised, was to enable the artisan to become a small capitalist, and the laborer a small landowner. "Three acres and a cow" in the country had its analogue in schemes of leasehold enfranchisement in the towns. As an alternative to the existing order of squires and captains of industry, we had offered to us a millennium of peasant proprietors and small masters. It is needless to enlarge upon the self-complacency with which both Liberal and Conservative capitalists delighted in reminding the working-men of all the future possibilities of self-advancement, when land should be "free," food cheap, and industrial competition unrestricted. The epics of this faith have been written by that unconscious corrupter of youth, Mr. Samuel Smiles, and are still fresh in the memories of most of us.

In 1880, Mr. Gladstone came into power on a wave of popular indignation against atrocities in Bulgaria, which dispensed with the necessity for any programme of social reforms in England. The political Radicals, swept along by the same wave, were too busy denouncing international aggression to be effective even on fiscal reform and political democracy, beyond which they had practically no vision. The Conservatives, less traditionally bound to Administrative Nihilism, had just consolidated the Factory Acts, but their leaders had been so far perverted as deliberately to leave the whole range of sweated trades outside the effective scope of the law and to give up all attempts to shorten the hours of labor. Even the working-men had been permeated by the same policy. The Trade Union leaders could think of only four trivial amendments to propose to the Factory Bill of 1878. The Trade Union Congress of those years asked for practically nothing but an Employers' Liability Bill. In 1879 there were a great many more unemployed than there have ever been since, but no responsible authority thought of anything but charity or poor relief for them. Free Education, Extension of the Factory Acts, Limitation of the Hours of Labor, Expansion of Municipal Activity, though all proposed long before, seem, in 1880, scarcely to have entered the heads of any of those who were leading either the Conservative, the Liberal, the Radical, or the Trade Union forces. But more striking even than this barrenness of programme was the total absence of any systematic view of politics as a whole. In this respect the most advanced statesmen of fourteen years ago stood in marked contrast with the Philosophic Radicals of the first half of the century. I will quote the significant comment of a shrewd critic of Mr. Gladstone's Cabinet:

"James Mill and his school had two characteristics which have not always marked energetic types of Liberalism, and perhaps do not mark them in our own day. The advanced Liberals of his time were systematic, and they were constructive. They surveyed society and

institutions as a whole ; they connected their advocacy of political and legal changes with theories of human nature ; they considered the great art of government in connection with the character of man, his proper education, his potential capacities. They could explain in the large dialect of a definite scheme what were their aims and whither they were going. . . . Is there any such approach to a body of systematic political thought in our own day? We cannot say that there is.”*

Now, in estimating the progress of Collectivism between 1880 and 1894, I do not propose to make any parade of the membership and influence of the various Socialist societies, which seem to me to be, at the present time, far greater than at any previous period. Nor will I recite a long list of bills which have been passed during the last fourteen years, and claim these as more or less triumphs of Collectivism. It would be easy to argue that the multiplication of municipal gasworks is an unconscious adoption of the principle of Socialism, just as the freeing of schools and the building of gratuitous libraries is of that of Communism. [But what we Socialists are aiming at is not to secure this or that reform, still less to put this or that party into power, but to convert the great mass of the English people to our own views. We are trying to satisfy the ordinary man, not merely that most of the existing arrangements of society are fundamentally defective—for on that point the great majority have always been most painfully convinced—but also that the main principle of reform must be the substitution of Collective Ownership and Control for Individual Private Property in the means of production. In short, the Socialist task is to contribute to this generation the “body of systematic political thought,” of which Mr. John Morley was in 1882 deploring the lack. Though we cannot count among our ranks any men of the calibre of Bentham and James Mill, though we have neither the wealth nor the position of the Philosophic Radicals of the first part of the century, yet I take it that the work set before us is analogous to theirs. The Socialists are the Benthamites of this generation.] And if I had to sum up the effect upon the public mind of the Socialist propaganda of the past fourteen years, I could find no better description than that given of the work of the Benthamites.

“They produced,” says a very competent observer, “a much more serious effect on public opinion than superficial inquirers perceived, or interested ones would acknowledge. The important practical effect was not made evident by converting and bringing over large numbers of political partisans from one banner or class to another, or by making them renounce one appellation and adopt another ; but it was shown by affecting the conclusions of all classes, and inducing them, while they retained their old distinctive names, to reason after a new fashion, and according to principles wholly different from those to which they had been previously accustomed.”†

* Mr. John Morley, in a review of Bain's “Life of James Mill,” *Fortnightly Review* vol. xxxi., p. 503 (April, 1882).

† J. A. Roebuck.

It is, of course, especially in the economic and industrial field that we find this reasoning "after a new fashion, and according to principles wholly different from those to which they had been previously accustomed." It has become more and more plain that the facts of industrial life are "dead against" the realization of the individualist ideal of each man becoming his own master. The Industrial Revolution, with its aggregation of production into ever larger enterprises, has rendered it practically impossible for five-sixths of the population to be anything but hired servants, dependent on the owners of land and capital for leave to earn a living. At the same time the spread of economic knowledge has made it clear that even the most virtuous artizan cannot dodge the law of rent; and he is therefore left face to face with the grim fact of a colossal tribute levied by ownership upon industry without any obligation on the part of the receivers to render social service in return. It is especially the growing understanding of this Ricardian law of rent which has revolutionized London politics, and has caused the hostile indifference with which the artizan in other centres is coming to regard both the great political parties. The outcome of this new ferment is the formation of an incipient Collectivist body of opinion among the great bulk of the younger men, the rising London party, and the new-born Labor Movement.

The political effect of this change of opinion is seen in the gradual transformation of party programmes, especially on the Land question. In the Liberal party the new Collectivist section is in direct antagonism to the "old gang." Its aim is not the subdivision of property, whether capital or land, but the control and administration of it by the representatives of the community. It has no desire to see the Duke of Bedford replaced by five hundred little Dukes of Bedford under the guise of enfranchised leaseholders, but prefers to assert the claim of the whole community to the land, and especially to that "unearned increment" of value which the whole community creates. It has no vain dream of converting the agricultural laborer into a freeholder, farming his own land, but looks to the creation of parish councils empowered to acquire land for communal ownership, and to build cottages for the laborers to rent. The path to its town Utopia is that of Mr. Chamberlain's early career, though not of his political programme—unlimited municipalization of local public services and a wide extension of corporate activity. London in particular has caught up the old Birmingham cry of "High rates and a healthy city," but with a significant difference. Our modern economists tell us that the first source of public revenue for a rising city is the growing rental value of its site, which at present falls into private hands. Hence the new demand for the gradual municipalization by taxation of urban land values—a demand still so little understood by most of our statesmen that they fondly imagine it to have something to do with a division of rates between houseowner and occupier. It is coming to be remembered, in short, that Bentham himself, the great father of Political Radicalism, urged that taxation need not be limited to the supply of funds for the bare

administrative expenses of the State, but that, wisely handled, it also supplied a means of gradually securing the great end of equality of opportunity to every citizen.

The typical young politician, who twenty years ago was a convinced Individualist quoting Mr. Herbert Spencer, is nowadays an empirical Collectivist of a practical kind. His face is turned away from the Individualist ideal of his fathers towards a period of ever-increasing collective action. Happily, however, he is no Utopian, and realizes that it is impossible all at once to take over the administration of the land and capital of the community. Where direct public administration is still impracticable, the public interest can only be secured by collective regulation of the conditions of labor, in order to prevent the Standard of Life of the workers from being degraded by private greed. And hence it is that the extremely valuable mantle shared by Robert Owen and Lord Shaftesbury, and despised by the older Liberals, is now the joint heritage of the Labor party and the Collectivist Radicals; Eight Hours Bills, practicable and impracticable, are the order of the day, and drastic proposals for the annihilation of "Sweating" excite the undisguised horror of the older members of both Liberal and Conservative parties. And since all this regulation and supervision of private enterprises is burdensome and expensive, the presumption of the younger politicians is distinctly against individual profit-making where it is possible to dispense with it. The best Government is no longer "that which governs least," but "that which can safely and advantageously administer most."*

All this is encouraging progress for so short a period as fourteen years. But it amounts, of course, to no more than the preliminary steps in the conversion of England. Public opinion, in fact, is in "a fine state to begin on." Adhesion to Socialism is no longer a disqualification for a candidate. Politicians lend a willing ear to Socialist proposals. Now is the time to bring to bear a body of systematic and constructive political thought such as that with which the Philosophic Radicals won their great triumphs. The greatest need of the English Socialist Party at this moment is men and women of brains who will deliberately set themselves, by serious study, to work out the detailed application of Collectivist principles to the actual problems of modern life. We need to do a great deal more hard thinking in almost every department of our Socialist programme. I am appalled when I realise how little attention we have yet been able to pay to what I may call the Unsettled Questions of Democratic Administration.

To take, for instance, the pressing problem of the Unemployed. In my humble judgment no plan has yet been devised by which the fluctuations of work could be entirely prevented, or safe and profitable employment found for those rendered idle by no fault of their own. It is easy enough to demand that something should be done;

* A more detailed account of this change of thought will be found in *Fabian Essays in Socialism*, and in the writer's *Socialism in England*.

and I entirely agree with agitating the subject ; but something more than agitation is required. It is of no use urging remedies which can be demonstrably proved to be worse for the patient than the disease itself. I fear that if we were given full power to-morrow to deal with the unemployed all over England we should find ourselves hard put to it how to solve the problem.* Or to turn to another field, in which practically nothing has yet been done. Have we any clear and decided view as to the relation between central and local authorities? How far do we wish to increase the power of the national administration at the expense of local governing bodies—to what extent, that is, will our Social-Democracy be consistent with local Home Rule? The Glasgow Town Council, for instance, is at this moment quarrelling with the Postmaster-General as to whether the telephone shall fall within the sphere of municipal or of national Socialism. It is evident that some departments of public administration can be best managed from one central office. It is, I suppose, equally evident that others must be administered locally, under some kind of central control. But which subjects should be local and which should be central—upon what principle the division should be made, and in what form and to what extent there should be a central control—these are problems to which, as far as I know, no solution has been found and very little serious thought been given.

I do not suggest that we Socialists are more ignorant than other people: on the contrary, the two puzzles that I have chosen are at present puzzles to the whole world. But the whole world is not equally interested with ourselves in getting a solution of them. Those who believe that nothing ought to be done for the unemployed are not likely to succeed in finding anything; and we can hardly expect those who object to any extension of Democracy to help us to solve the problems which it presents. It is we who must discover the answers to our own conundrums; and I do most seriously suggest that there is no more valuable field of work for any group of Socialists, no more fruitful service to the Socialist cause, than for them earnestly and persistently to study, in the light of the ascertained facts, some one of the many social problems to which we have to apply our Socialist faith. Depend upon it, the first step to getting what we want is a very clear and precise knowledge of what it is that we want.

But this want of precision in our thinking may easily do worse than merely delay our progress; there is, as it seems to me, a good deal of danger of its leading us positively astray from the Socialist goal. The circumstances of modern life are so complicated, the problems to be dealt with are so difficult, the need for prompt action is often so great that we may easily be led to take up schemes of reform which promise some immediate improvement on the present

* The student beginning this subject should, as the first step, master the Blue Book of the Labor Department, *Agencies and Methods for Dealing with the Unemployed*, published October, 1893, price 1s. 9d. (C—7182).

state of things, but which are not really in the line of advance towards a genuine Collectivism.

Here I venture on dangerous ground. But if we are to clear up our ideas, and apply our Socialist principles to the practical problems of life, we must definitely make up our mind between contrary ideals. If our aim is the transformation of England into a Social-Democracy, we must frankly accept the changes brought about by the Industrial Revolution, the factory system, the massing of population in great cities, the elaborate differentiation and complication of modern civilization, the subordination of the worker to the citizen, and of the individual to the community. We must rid ourselves resolutely of those schemes and projects of bygone Socialisms which have now passed out of date, as well as from the specious devices of Individualism in a new dress. All these I class together as Spurious Collectivism, making, in my view, not for social progress, but for reaction.

Utopia-founding.

And first let us deal with the ideas of those amiable enthusiasts who are still bent on the establishment of ideal communities. Scarcely a year passes without some new project for the formation of a perfect Socialist colony in Paraguay or Peru, Mexico or Matabeleland, where all the evils of landlordism and the machine industry are to be avoided. The authors of such schemes are often chided for their unbounded belief in human nature. To me, on the contrary, they seem to be throwing up the sponge in despair. Their disgust with the world of competition and Individualism, their impatience with the slow and gradual methods of Democratic progress, come, really not from too much but from too little faith in humanity. "I see very little hope for the workers as a class," writes one of them, "even if they get all they want—our best plan for the present is to form for ourselves a little backwater outside the force of the main current, so that we ourselves may not be entirely swept away—a little space free from the mists and miasma of competition, so that we, at least, may breathe the fresh air of freedom and brotherhood."*

Now I do not for a moment wish to discourage any young Socialist who feels a burning desire to shake the dust of civilization off his feet. Nevertheless, the aim of the modern Socialist movement, I take it, is not to enable this or that comparatively free person to lead an ideal life, but to loosen the fetters of the millions who toil in our factories and mines, and who cannot possibly be moved to Freeland or Topolobampo. For the last two generations we have had social prophets, who, seeing the impossibility of at once converting the whole country, founded here and there small companies of the faithful, who immediately attempted to put into practice whatever complete ideal they professed. The gradual adoption of this ideal by the whole people was expected from the steady expansion of these isolated communities. But in no single case has this expectation been ful-

* Letter in *Brotherhood*, January, 1894.

filled. Most of these isolated colonies outside the world have failed. Some few, under more favorable circumstances, have grown prosperous. But whether they become rich or remain poor, they appear to me equally disastrous to the real progress of Socialism inside the world as we know it.

Wise prophets nowadays do not found a partial community which adopts the whole faith ; they cause rather the partial adoption of their faith by the whole community. Incomplete reform is effected in the world of ordinary citizens, instead of complete reform outside of it. Genuine Socialism grows by vertical instead of horizontal expansion ; we must make ever more Socialistic the institutions amid which we live, instead of expecting them to be suddenly superseded by any new set imported from elsewhere. By this method progress may be slow, but failure is impossible. No nation having once nationalized or municipalized any industry has ever retraced its steps or reversed its action.

Sometimes, however, the Utopia-founder comes in more dangerous guise. He propounds his scheme, not entirely as a Socialist colony, but as a means of providing for the unemployed. Here is one of the latest of these proposals, put forward by a comrade whom we all respect for sincerity and boundless energy :

“ The Easiest Way to Socialism.

“ In the present crisis, with the unemployed clamoring for immediate relief and every humane heart in the country backing their plea, the most suitable and hopeful governmental way of ushering in a Socialistic State is to found for them a partial and optional Co-operative Commonwealth. This is now, probably, in the present state of public opinion, the most convenient and easy end to begin at ; better even than any general scheme of land nationalization, or the nationalization of anything else. Let the nation acquire immediately, with public money or public credit, just enough of the 6,000,000 untilled or half-tilled acres of the country to set those to work productively who ask for employment ; let these, under proper guidance, make some sort of rough dwellings for themselves and their families and one another, grow food, and supply mutually each other's pressing needs ; as far as possible, let each man and woman be put to the kind of productive work they have been respectively accustomed to ; and let those who have no skill be trained into usefulness ; let the workers' wages be a draft on the store they help to fill by their labor ; let there not be any loss of vote or any slightest stigma of pauperism connected with this public organization of industry ; and let its internal management be as democratic as may be found consistent with the preservation of order and efficiency. Such an organization—a little optional co-operative commonwealth, free to every citizen—would become, in all probability, the nucleus of the coming Socialistic State. The standard of comfort in it at first would not be very high ; but, freer from the burden of landlordism and capitalism than the rest of the country, it would be bound to rise rapidly and steadily, and would attract permanently a larger and ever larger proportion of the nation and more and more skilled workers, until well-nigh all the industry and commerce of the country were absorbed into it.” *

Could there be a more enticing mirage ? Solve the problem of the Unemployed and establish a Social-Democratic Republic at one stroke ! What a contrast to such pettifogging work as slowly and with infinite difficulty building up a Municipal Works Department under the London County Council ; fighting to recover, inch by

* Editorial in *Brotherhood*, December, 1893.

inch, the control of the Thames, the docks and the water supply ; puzzling out the means of so perfecting the Mines and Railways Regulation Acts, the Factory and Public Health and Licensing Codes, that the degradation of the Standard of Life and the manufacture of fresh unemployed may be arrested ; discovering how to recover for the use of the whole community an ever larger share of the rent and interest going into idle pockets ; organizing, educating, and disciplining the workers into Trade Unions ; painfully elaborating a network of schools and classes which shall day by day open out to the poorest child in the remotest corner of the realm more of the real treasures of civilization. Why not drop all this and concentrate our efforts on the simple expedient of persuading a Parliament of landlords and capitalists to vote the necessary sixty or a hundred and sixty millions sterling, to buy and stock 6,000,000 acres of land on which our out-of-works may be "freer from the burden of landlordism and capitalism than the rest of the country" ? I do not wish to-night to discuss the problem of the Unemployed. It is, I think, probable that, as regards one class of the Unemployed, a term of servitude in an educational Labor colony on a small scale, managed in a proper way, would be the best (though an expensive) means of restoring them to the ranks of productive citizens. But to imagine that any such colony could be self-supporting, that the land which no capitalist will now till with expert farm laborers at ten shillings a week, would yield Trade Union rates of wages to a mixed crowd of unemployed townsmen ; that such a heterogeneous collection of waifs and strays, without a common acquaintanceship, a common faith, or a common tradition, could be safely trusted for a single day to manage the nation's land and capital ; finally, to suppose that such a fortuitous agglomeration of undisciplined human atoms offers "the most suitable and hopeful way of ushering in a Socialist State"—all this argues such a complete misconception of the actual facts of industrial and social life, such an entire misunderstanding of the process by which a Democratic society passes from one stage of its development to another, that I feel warranted in quoting it as an extreme instance of Utopia-founding.

What we Socialists are after is not any clearing out from our midst of those unfortunates who form the reserve army of Labor, even if this were possible, but the organization of public services in such a way that no such reserve army shall exist. We do not, for instance, want to set unemployed dockers or gasworkers to dig, but so to administer the docks and gasworks that there shall be no such constant fringe of casual labor. To the solution of this problem Utopia-founding, or any other scheme of "organizing the unemployed," helps just nothing at all.

Trade Sectionalism.

A more insidious form of Spurious Collectivism is that which makes, consciously or unconsciously, the trade and not the community the unit of administration, and which is expressed in the cry

of the land for the laborer, the mine for the miner,—I do not know whether we may add the school for the school-teacher and the sewer for the sewerman.

This Trade Sectionalism is of very old date. It was one of the earliest forms taken by the Socialist movement in this country. Under the system proposed by Robert Owen in 1833 the instruments of production were to become the property, not of the whole community, but of the particular set of workers who used them. The Trade Unions were to be transformed into "National Companies" to carry on all the manufactures. The Agricultural Union was to take possession of the land, the Miners' Union of the mines, the textile unions of the factories; each trade being carried on by its particular Trade Union, centralised in one "Grand Lodge."

Of all Owen's attempts to reduce his Socialism to practice, this was certainly the very worst. His schemes of factory legislation have raised the standard of life of millions of workers all over the world. For his short-lived communities there was at best the excuse that within their own area the competitive conflict between independent owners was eliminated. But in "the Trades Union" as he conceived it, the mere combination of all the workmen in a trade as co-operative producers would no more have eliminated commercial competition than a combination of all the employers in it into a joint stock company. His Grand Lodges would have been simply the head offices of huge companies owning the entire means of production in their industry, and subject to no control by the community as a whole. They would therefore have been in a position at any moment to close their ranks and admit fresh generations of workers only as employees at competitive wages, instead of as shareholders, thus creating at one stroke a new capitalist class and a new proletariat. Further, improvident shareholders would soon have begun to sell or pawn their shares in order to spend their capital, finally dropping with their children into the new proletariat; whilst the enterprising and capable shareholders were trafficking in their shares to buy into other and momentarily more profitable trades. Thus there would have been not only a capitalist class and a proletariat, but a speculative stock market. Finally there would have come a competitive struggle between the companies to supplant one another in the various departments of industry. Thus the shipwrights, making wooden ships, would have found the boiler-makers competing for their business by making iron ships, and would have had either to succumb or to transform their wooden ship capital into iron ship capital and enter into competition with the boiler-makers as commercial rivals in the same trade. Moreover the whole effect of economic rent was entirely overlooked. The fact that the expenditure of labor required to bring articles of the same desirability to market varies enormously accordingly to natural variations in fertility of soil, distance to be traversed, proximity to good highways, waterways or ports, accessibility of water power or steam fuel, and a hundred other circumstances, including the organising ability and executive dexterity of the producer, was left

out of account. Owen assumed that the labor of the miner and that of the agricultural laborer would spontaneously exchange equitably at par of hours and minutes when the miners had received a monopoly of the bowels of the country, and the agricultural laborers of its skin. He did not even foresee that the Miners' Union might be inclined to close its ranks against recruits from the farm laborers, or that the Agricultural Union might refuse to cede sites for the Builders' Union to work upon. In short, the difficult economic problem of the equitable sharing of the advantages of superior sites and opportunities never so much as occurred to the enthusiastic adherents of William Thompson's theory, afterwards to be elaborated by Karl Marx, that all exchange values could be measured in terms of "Labor Time" alone.*

Now, I do not suggest that we are in danger of any complete revival of Owen's Trade Sectionalism. But I often hear Socialists drop into proposals which tend in that direction. The impatience manifested when it is pointed out that Trade Unions will continue to be necessary in a Social-Democratic State; the reluctance which many Socialists exhibit to regarding Board Schools or Woolwich Arsenal as essentially Socialistic institutions; the proposals occasionally made that the operatives in each trade should elect the managers of it or fix their own hours of labor—all these seem to me to be survivals of Owen's principles, diametrically opposed to modern Socialism. But let me take an actual example from France—a land where all parties are supposed to be more strictly logical in their thinking than those of our compromising island. The other day, Monsieur Goblet, with, as I understand, the concurrence and support of the whole of the Socialist members of the Assembly, proposed, as a Socialist measure, that the present coalowners should, under certain circumstances, be expropriated, and the mines transferred—not to the community as a whole, or to any town or district—but to the men actually working in each mine, who were to divide among themselves the profits hitherto enjoyed by the individual lessees of the mines. I have read a good many notices of this proposal, but I have nowhere seen it pointed out that, so far from being Socialist in character, it is really in direct opposition to Socialist principles. We do not desire to see the mines, and the profits from the mines, transferred to the miners, but to the community as a whole. How far the management should be national and how far local is an unsettled problem of Democratic administration. But to hand over the nation's coal to one particular set of the workers is, in my view, no more a Socialist proposal than the late Sir George Elliot's recent scheme for transferring it to a capitalist syndicate. What we as Socialists look for is, not the assumption by any trade of the management of that trade, but the extension of the public organisation of industry, whether under the Central Government, the County, the Town, or the Parish Council, in the interest of the community as a whole.

*The Owenite Trade Unionism of 1833-4—the "New Unionism" of its time—will be found described in *The History of Trade Unionism*, by Sidney and Beatrice Webb.

Joint Stock Individualism.

If we reject Owen's Trade Sectionalism as a spurious form of Collectivism certain to develop into Joint Stock Individualism on a large scale, what are we to say to schemes which frankly begin and end with Joint Stock Individualism on a small scale? The zealous and devoted men who made the Christian Socialist Movement of 1848-54, and who got their ideals from Louis Blanc and the Paris Socialists of 1848, sought to replace the capitalist *entrepreneur*, not by the official of the community, but by little groups of independent workmen jointly owning the instruments of their trade, and co-operating in a "self-governing workshop." This dream of co-operative production by Associations of Producers still lingers vaguely about the Trade Union world, and periodically captures the imagination of enthusiastic reformers. It is still nominally recognised by the main body of co-operators as one of the ideals of their movement, and it enjoys the very vigorous advocacy of an association of its own. But alike in the Trade Union and the Co-operative worlds, the Association of Producers, necessarily sectional in principle and working for its own gain, is being rapidly superseded by the contrary ideal of an Association of Consumers, carrying on industry, not for the profit of the worker, but with the direct object of supplying the wants of the community in the best way.*

I should have thought there would have been no doubt as to the side that we Socialists should take in this controversy. It may be all very well for a little group of thrifty artisans to club together and set up in business for themselves in a small way. If their venture is prosperous they may find it more agreeable to work under each other's eye, than under a foreman. Co-operative production of this sort is at best only a partnership of jobbing craftsmen, with all the limitations and disadvantages of the small industry. From beginning to end it is diametrically opposed to the Socialist ideal. The associated craftsmen produce entirely with a view to their own profit. The community obtains no more control over their industry than over that of an individual employer. They openly compete for business with private firms and other associations of producers. The self-governing workshop belongs in fact, not to Socialism but to Joint Stock Individualism. Moreover, in the great majority of existing cases the so-called associations of producers have a darker side. There are capitalist partners who are not workers, and wage-workers who are not partners. In order to increase the gains of the members, their numbers are strictly limited, new hands are taken on at wages often below Trade Union rates, or worse still, work is given out to be done at home on the sweating system. The self-governing workshop becomes, in short, a little partnership of small masters, with all the attendant evils of that decaying form of industrial organization. The co-operative production of the self-governing workshop appears to me, therefore, Spurious Collectivism of a bad type.

* See *The Co-operative Movement in Great Britain*, by Beatrice Potter.

On the other hand the co-operative production of the store and the two great co-operative wholesale societies is a genuine step in advance along our own lines. Unfortunately the distinction between the co-operation of associations of consumers, and that of associations of producers is often misunderstood. We have Socialists and Trade Unionists denouncing the great co-operative organizations of the North of England, with their million of members, and the forty millions sterling of annual trade which they have rescued from the profit-maker—denouncing, too, not their incidental shortcomings, but the very principle of their association; and upholding, on the contrary, what is I presume, supposed to be the more Socialist principle of profit-sharing or even of the self-governing workshop. The great boot-factory which the million of co-operators have built at Leicester for the supply of their own boots, is attacked on the ground that the profits of the bootmaking are not given to the boot-makers there employed, but are carried to the credit of the whole co-operative community of which the bootmakers can and do form part. The working-men of Rochdale or Leeds, who have joined together to organize on a co-operative basis the supply of their own wants, are reproached for not handing over some or all of the annual surplus of receipts over expenditure (for I will not call it profit) to the shop-assistants employed in their service. For the life of me I cannot see that this is a Socialist criticism. The whole of our creed is, that industry should be carried on, not for the profit of those engaged in it, whether masters or men, but for the benefit of the community. We recognise no special right in the miners, as such, to enjoy the mineral wealth on which they work. The Leicester boot operatives can put in no special claim to the profits of the Leicester boot factory, nor the shopmen in a Co-operative Store to the surplus of its year's trading. It is not for the miners, bootmakers, or shop-assistants, as such, that we Socialists claim the control and the profits of industry, but for the citizens. And it is just because the million co-operators do not, as a rule, share profits with their employees as employees, but only among consumers as consumers; because the control of their industry is vested not in the managers or operatives but exclusively in the members with one man one vote; and because they desire nothing more ardently than to be allowed in this way to make the whole community co-partners with themselves and participants in their dividend, that their organization appears to me to be thoroughly Collectivist in principle.

Industrial Anarchism.

I suspect, however, that there is something more than confusion of thought in the preference frequently shown by Socialists for the self-governing workshop run by the workers in it, over the Co-operative Factory or Municipal Works Department managed by the representatives of the community. In our capitalist system of to-day there is so much "nigger-driving," so many opportunities for petty tyranny, so frequently a bullying foreman, that I do not wonder when working-men look with longing upon an ideal which promises

to make them their own masters, if only in a small way. With this feeling everyone must sympathize. It is just because the conditions of the industrial servitude of the great mass of the people are so unsatisfactory, that we strive to make them citizens and workers of a Socialist State. But the desire of each man to become his own master is part of the old Adam of Individualism. The time has gone by for carrying on industry by independent producers, such as survive in the cobbler and the knife-grinder, or even by little associations of such producers, like the self-governing workshop in its best form.

Socialists who hanker after these delights have forgotten their Karl Marx. The steam-engine, the factory and the mine have come to stay; and our only choice is between their management by individual owners or their management by the community. As miner, mechanic, or mill operative, the worker is and must be the servant of the community. From that service Socialism offers no escape. All it can promise is to make the worker, in his capacity of citizen, jointly the proprietor of the nation's industry and the elector of the head officers who administer it. As citizens and electors, the workers we may presume, will see that the hours of labor are as short, the conditions of work as favorable, and the allowance for maintenance as liberal, as the total productivity of the nation's industry will afford. Organized in their Trade Unions, moreover, the workers in each department of the nation's service will know how to make their voice heard by their fellow-citizens against any accidental oppression of a particular trade.

And here I must mention a common misunderstanding of a Socialist phrase, the Abolition of the Wage System. Some of our Anarchist friends persist in quoting this as if it implied the entire abolition of the service of one man under the direction of another. To listen to their interpretation one would imagine that they suppose us to contemplate a reversion to the mythical time when every man worked as an independent producer, and enjoyed the whole product of his individual labor. I need hardly say that Socialism involves nothing of the sort. We propose neither to abandon the London and North Western Railway, nor to allow the engine-drivers and guards to run the trains at their own sweet will, and collect what they can from the venturesome passengers.

By the abolition of the wage-system we mean the abolition of the system now generally prevailing in the capitalist industry, by which the worker receives a wage not determined with any reference to his quota of the national product, nor with any regard for the amount necessary to maintain him and his family in efficient citizenship, but fixed solely by the competitive struggle. This competitive wage we Socialists seek to replace by an allowance for maintenance deliberately settled according to the needs of the occupation and the means at the nation's command. We already see official salaries regulated, not according to the state of the labor market, but by consideration of the cost of living. This principle we seek to extend to the whole industrial world. Instead of converting every man into an independent producer, working when he likes and as he likes, we aim at

enrolling every able-bodied person directly in the service of the community, for such duties and under such kind of organization, local or national, as may be suitable to his capacity and social function. In fact, so far are we from seeking to abolish the wage-system so *understood*, that we wish to bring under it all those who now escape from it—the employers, and those who live on rent or interest, and so make it universal. If a man wants freedom to work or not to work just as he likes, he had better emigrate to Robinson Crusoe's island, or else become a millionaire. To suppose that the industrial affairs of a complicated industrial state can be run without strict subordination and discipline, without obedience to orders, and without definite allowances for maintenance, is to dream, not of Socialism but of Anarchism.*

Peasant Proprietorship.

Is it to the influence of this same yearning for industrial anarchism that we are to attribute the persistence among us of such a spurious form of Collectivism as Peasant Proprietorship? I do not mean Peasant Proprietorship in its crudest form. I suppose that no Socialist desires to see the land of the country divided among small peasant freeholders, though this is still the ideal professed by many statesmen of "advanced" views. We are, I hope, all thoroughly convinced that economic rent in all its forms should enrich, not any individual, but the community at large. But it is not difficult to trace, in some of those who are keen advocates of Land Nationalization, survivals of economic Individualism. We see our esteemed friend, Michael Davitt, lending his influence, not to secure the land of Ireland for the people of Ireland, but to tighten the grip which half-a-million individual Irishmen have on their particular holdings. Many Scotch comrades, too, seem eager to "destroy landlordism" by converting the crofter into a freeholder. Even the Land Nationalization Society cherishes some project of allowing each Englishman, once in his life, to choose for himself a piece of what it professedly desires to obtain for all in common. This seems to me about as reasonable as to propose that each Englishman should be allowed, once in his life, to choose for himself one ship out of the Royal Navy, or that each Londoner should have the right, on his twenty-first birthday, to appropriate for his own use one particular corner of the London parks. The same spurious Collectivism runs through all forms of Leasehold Enfranchisement—a thoroughly reactionary movement which, I am glad to think, is nearly dead.† The agitation for Small Ownings has perhaps more vitality in it; but it is rapidly changing into an agitation for Small Holdings, owned and let by the Parish Council or some other Collectivist organization. But there are more insidious forms of this Peasant Proprietorship fallacy. What are we to say to comrades who demand that the County Council shall supply artisans' dwellings "to be let at the

* See *The Impossibilities of Anarchism*, by G. Bernard Shaw (Fabian Tract 45).

† See *The Truth about Leasehold Enfranchisement* (Fabian Tract No. 22).

cost of construction and maintenance only"? At present we allow the landlords of London to put into their own pockets sixteen millions a year of annual ground rental of the bare site. If we were to cover London with artisans' dwellings "let at the cost of construction and maintenance only," we should simply be handing over these sixteen millions of rental value, towards which the labor of all England contributes, to the particular tenants of our new dwellings. How, moreover, if all buildings are to be let at equal rents, are we to equalize the advantages of a flat overlooking Hyde Park and a similar flat out at Holloway? Since we cannot all live on the best sites, those who do must contribute, for the common benefit, the equivalent of the extra advantage they are enjoying. That is to say, a Socialist State or municipality will charge the full economic rent for the use of its land and dwellings, and apply that rent to the common purposes of the community. To follow any other course would be to fall into the Peasant Proprietorship fallacy.

Now I fully agree with those who urge greater unity of action and charity of conduct in the Socialist Movement. But we cannot rise above mere denunciation of existing evils, and get that "body of systematic political thought" which is at present our greatest need, unless we clear up our own ideas. To do this we must, in all friendliness, criticise any proposal that appears to belong to the Spurious Collectivism which at present confuses the issue. I hope we may learn scrupulously to abstain from personal abuse or denunciation. I trust we shall avoid imputing motives. But if we are to make any intellectual progress at all, we must have a great deal more frank discussion of the details of the Socialist programme. The movement gains nothing by a complacent toleration of Spurious Collectivism. I do not urge the universal adoption by all Socialists of a rigid practical programme complete in all its details. But our one hope of successful propaganda lies in the possession of exact knowledge and very clear ideas of what it is we want to teach. To mix up, under the common designation of Socialism, proposals which tend to Anarchism with those which tend to Collectivism, to accept Democracy and yet to dally with the idea of catastrophic Social Revolution, to confound Utopianism with modern State Socialism, to waver between a trade or workshop sectionalism and ownership by the community—all this argues a confusion of thought which is the worst possible equipment for a successful teacher. If we are to have anything like the success of the early Philosophic Radicals, we must be able, like them, to "explain in the large dialect of a definite scheme" "what are our aims and whither we are going."

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and a complete list of publications can be obtained from the Secretary, at the Fabian Office, 3 Clomont's Inn, London, W.C.

Fabian Tract No. 62.

PARISH AND DISTRICT COUNCILS:

What they are and What they can do.

PUBLISHED AND SOLD BY
THE FABIAN SOCIETY.

PRICE ONE PENNY.

LONDON :
THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.
PUBLISHED 1895. THIRD REVISED EDITION JANUARY 1913.

PARISH AND DISTRICT COUNCILS :

What they are and what they can do.

THE public affairs of every Parish, Town and Poor Law Union in England and Wales are managed by Meetings and popularly elected Councils or Boards. Almost all adult men and most women who are householders are electors for these bodies, and are therefore responsible for their doings ; and every man and woman and child in the kingdom is to a greater or less degree affected by the manner in which they do their work. This tract does not deal with London nor with County and Town Councils. It treats of the following local governing bodies created or affected by the Local Government Act of 1894, namely :

1. Parish Councils, together with Parish Meetings in the larger Parishes.
2. Parish Meetings without Parish Councils in the smaller Parishes.
3. Urban District Councils in smaller towns and thickly populated districts.
4. Rural District Councils, which have control in all places where there are no Town Councils nor Urban District Councils.
5. Boards of Guardians which cover the whole of England and Wales.*

The powers and duties of these bodies, and the rules governing their election and proceedings, are far from simple, and many people do not fully understand them. This tract is intended to explain them as clearly as possible to working men and women. If any part of the tract is not clear to any reader, or any point is omitted on which he wants information, he can write to the Secretary of the Fabian Society, 3 Clement's Inn, Strand, London, W.C., who will endeavor to send him a full and clear answer free of charge.

PART I. METHODS OF ELECTION.

Who are the Electors.

One set of rules decides who can take part in the election of all these bodies, that is to say, who can attend the Parish Meeting, and who may vote for Parish, Urban, and Rural District Councillors and Guardians. The persons who are entitled to vote in these elections are called "Parochial Electors"; and they can vote at all of them, and no one else can vote at any of them, or has the right to attend and take part in the Parish Meeting. A Parochial Elector is any person, man or woman, married or unmarried, who is on the list of registered voters, either for Parliament or for the County Council ;

* This tract does not deal with the Poor Law, but only with the manner of electing Boards of Guardians, and such of their duties as are not connected with the Relief of the Poor. See Fabian Tract No. 54, "Humanizing of the Poor Law."

or, in the case of married women, on the special list for the Parish. It makes no difference whether or not a person pays rates, or whether or not he has received poor relief.* Those on the register can vote, and those not on it cannot. A person can be registered as an elector in every parish for which he is qualified; and he can vote at the Parish Meeting and for the Parish Councillors in every such parish. But he can vote only in one ward of any one parish or urban district for Parish Councillors or Urban District Councillors; and only in one parish of any one union for Rural District Councillors and Guardians. In other words, he can vote only once in the election for any one Council.

Who can be Candidates.

Any person who is an elector for any of these bodies may be a candidate for it. And any person, man or woman, married or single, who has resided within the parish or district for twelve months before the date of nomination, may be a candidate. The rules as to residence are as follows:—For Urban District Councils it must be within the Urban District. For Guardians and Rural Districts it must be within the Union of which the Rural District forms the whole or a part.† For Parish Councils it must be in the parish or within three miles of its boundary. Residence cannot be exactly defined; this, however, is certain, that any person who has had a bedroom which he generally uses, and always can use, since March 25th of the preceding year, is a resident in that place.‡

Who cannot be Candidates.

No one may be elected a Councillor who is under twenty-one, or who is not a British subject, or who has, within the last year, received poor law relief (even if only medical relief), or who has within the last five years been made bankrupt or imprisoned with hard labor for any crime (mere imprisonment as alternative to a fine or for non-payment of rates, or of contribution to the Poor Law Guardians, does not disqualify), or who is concerned in any contract with the Council, or who holds any paid office under it. But a person holding a paid office from the Guardians or District Council can be elected a Parish Councillor, or a paid officer of the Parish Council can be elected a Guardian or District Councillor. And a paid officer of the Guardians can be an Urban District Councillor, and *vice versa*.

Moreover, a contract for letting or selling land does not disqualify. Therefore, persons who lease allotments to or hire them from a Council are not disqualified from being members of that Council.

How Candidates can conduct Elections.

There is no limit to the expenses which candidates at these elections may incur for election addresses, meetings, etc., but all such expenses will have to be paid by themselves. Only the official expenses of the election will be paid out of the rates.

* But of course persons who have received poor relief (other than medical) will be liable to have their names struck off the register at the next revision.

† Any person qualified to be elected a Councillor of a Borough is also qualified to be elected a Guardian for any parish within that Borough.

‡ See the Local Government Act, 1897, sec. 1.

In Urban Districts, at elections of Councillors or Guardians, no meetings must on any account be held in public houses, or clubs with licences to sell intoxicants, or even in places where refreshments of any sort are sold. A candidate for whom or by whom a meeting is held in such premises can be prosecuted for illegal practices.

But this rule does not apply to Rural Districts. In elections of Parish or Rural district Councillors, public meetings may be held in any place whatever; but rooms in licensed premises or places where refreshments are sold must not be hired or used as Committee Rooms.

No money must be spent on hiring carriages or bands, or for flags, ribbons, torches, etc. Every bill printed must bear the name and address of the printer and publisher.

Polling Agents.

For Parish Council Elections one third or more of the candidates, but no less number, may appoint one joint polling agent to look after their interests in the polling booth and to prevent fraud. For District Council and Guardians Elections, each candidate, if there are only two, or one third of them or more if there are more than two, may appoint one agent. He may be paid or unpaid, but, if paid, he cannot vote. A candidate may be appointed polling agent.

Every polling agent must be appointed in writing, and the appointment must be sent to the returning officer two clear days before the poll.

No person may go into the polling place except the Presiding Officer and his clerks, policemen on duty, polling agents, and persons about to vote.

The Use of School Rooms by Candidates.

In Rural Districts, candidates for District or Parish Councils have the right to use for election meetings any schoolroom which receives a Government grant, or any suitable room maintained out of the rates. But it has been held that the Parish Council or Meeting alone can demand the use of schoolrooms for this purpose. The Parish Meeting in every parish should therefore appoint a small permanent committee with instructions to obtain the use of the schoolroom for any candidate who desires it. It is desirable as a rule to give a week's notice, and meetings can only be held at times which will not interfere with the ordinary use of the school. The persons making use of the rooms must pay the cost of lighting, etc. This right does not belong to Urban Districts unless they have obtained from the Local Government Board the powers of a Parish Council. It appears to be seldom exercised.

Elections at the Parish Meeting.

Parish Councillors are nominated at the Parish Meeting on printed forms supplied by the clerk. Written forms are equally good if correctly made out. Each nomination must be signed by two Parish Electors. The law specially provides that no mistake in spelling or other error of that sort shall make a nomination invalid, provided it is quite clear who is the person nominated, and who nominates him. If the chairman decides that a nomination paper is

valid, no one can afterwards object to it. If he wrongly decides that a nomination is invalid, it would be possible, though very expensive, to reverse his decision by an election petition. The nominations must be handed to the chairman, who must read them over in alphabetical order. A person nominated may withdraw at the meeting *before* the voting takes place, but not after it, unless a poll is demanded. Before the voting, any elector can ask questions of the candidates, and all candidates, whether electors or only residents, have a right to be present and to reply to the questions asked, and it is the duty of the chairman to allow time for this to be done. At the meeting the candidates are voted for by show of hands. Candidates, if electors, can vote for themselves and practically electors can vote for as many candidates as they like; since, although the law says they must not vote for more than the number of Councillors to be elected, it gives the chairman no power to refuse any elector's vote.

Five electors, or one-third of those present if less than 15 are present, or one elector with the consent of the chairman, can demand a poll. A candidate has no right to demand it, except as an elector. Candidates can withdraw after a poll is demanded by a formal letter to the returning Officer, up to six days before the poll. But the nominators of a candidate cannot withdraw him.

Elections by Ballot.

All polls for Parish and District Councillors and Guardians are conducted under nearly the same rules. They are by secret ballot; each elector can give one vote and no more to as many candidates as there are vacancies.

Casual Vacancies.

Vacancies may be caused by a Councillor or Guardian dying, becoming disqualified through receipt of poor relief, bankruptcy, crime, etc. (see page 3), or by failing to attend meetings for six months consecutively (unless prevented by illness or some other reason approved by the Council), or by resignation. A person who ceases to be qualified by ceasing to be a resident or an elector, can remain a Councillor until his term of office expires.

PART II. DESCRIPTION.

The Parish Meeting where there is no Council.

In parishes of less than 300 inhabitants the governing body is usually the Parish Meeting. It must assemble at least twice a year. At the annual meeting, to be held between 1st March and 1st April, inclusive, it must appoint a chairman and two or more overseers, who together form the official body. Other meetings may be called at any time by the chairman or by any six electors. Documents must be signed by the chairman and two parochial electors at the meeting. If the chairman be absent, another may be elected, who will, during that meeting, possess all the powers of the chairman. All Parish Meetings in parishes with or without a Council must be held not earlier than six o'clock in the evening. This rule applies to Parish Meetings only, and not to meetings of any Council.

The Parish Meeting where there is a Council.

This must meet at least once a year, between the 1st of March and the 1st of April, inclusive, and in 1913 and every third year thereafter its business will be to receive nominations for the Parish Council, and to elect it unless a poll is demanded.

The chairman of the Parish Council has the right to preside unless he be a candidate for the Council. If nominated as Councillor he must, unless he declines to stand, at once ask the meeting to choose another chairman. In that case, or if the chairman of the Council is absent, the meeting may elect as chairman any parish elector.

The Parish Meeting has many other very important duties. It must consider the accounts of every Parish Charity. It can refuse to pass them, and can appeal to the Charity Commissioners if they are not satisfactory. It must be consulted if the Council propose to spend more than a 3d rate. No right of way can be stopped without its consent. It has to decide whether the village shall have a recreation ground and free library, lights in the street, or a new burial ground. It can appoint committees, and it can pass resolutions on any subject that concerns the parish or any part of it.

It is the Parliament of the village, which has the right to assemble at any time and to discuss and demand redress of any grievances which the villagers have. It can instruct the Parish Council (that is, its Executive Committee) to take any action which it thinks needed, but it should be added that the Parish Council is not bound to obey its instructions, except in matters specified in some Act of Parliament. Whatever the Parish Council can do, however, the Parish Meeting can discuss.

It can be summoned by demand of any six parochial electors, or any two Parish Councillors, or by the chairman. The demand must be written, printed, or otherwise manifolded, and must be signed by the persons demanding the meeting. It must specify the time, place, and object of the meeting, and must be posted on the church door and in other conspicuous places in the parish. Seven clear days' notice must generally be given. Large parishes may be divided into wards, and small ones be united into groups, but each ward or each small parish has its own Parish Meeting and elects its own Councillors to sit on the common Parish Council. A ward has not a separate meeting for any purpose except electing Councillors.

The Parish Council.

This Council is elected at or after the Annual Parish Meeting in March or April, 1913, in every third year thereafter, and holds office for three years. Its first duty is to elect a chairman, who may be one of the members or any other person qualified to be a Parish Councillor for the parish. The chairman in all cases has a second or casting vote. It must also appoint a clerk. If there is a vestry clerk (appointed by the Act of 1850) he remains clerk. Otherwise, the Council may appoint one of its own members without pay. Failing this, the assistant overseer, if there is one, must be paid clerk. Failing either of these, any other person may be appointed, with or without pay. But the Council cannot have two paid

officers. The same person must be assistant overseer and paid clerk, except in parishes where there was a vestry clerk and an assistant overseer before 1805. The Council may also appoint as treasurer, without pay, a Councillor or any other person. A Councillor can resign by sending a letter of resignation to the chairman, and there is no fine for so doing. Vacancies in the Council are filled by the Council itself co-opting a new member. Meetings of the Council are open to the public unless a special resolution to the contrary is passed by the Council.

Other Regulations for all Rural Parishes.

ROOMS.—If there is a room belonging to the parish which can be had free of charge, the meetings are held there. But if not, then a room in an elementary school which receives public money, or in a police station or workhouse or other building maintained out of the rates, may be used free of charge, provided that the ordinary employment of the room is not interfered with. If none of these be available, a room may be hired. The Parish Meeting or Council may only assemble in a room in a public house when no other room can be obtained free of charge or at a reasonable cost.

These regulations apply to all Parish Meetings, to meetings of the Parish Councils, and to meetings held to consider about allotments. They do not apply to Urban Districts.

POLLS.—A poll may be demanded on any matter on which a vote has been taken at a Parish Meeting, and the demand may be made at any time before the conclusion of the meeting. Five electors, or one-third of the electors present (whichever number is the lesser), or one elector with the consent of the chairman, can demand a poll in the cases just named and for (1) the election of Councillors; (2) appointment of chairman or of a committee, or various matters connected with a committee; (3) appointment of overseer, and appointment or otherwise of assistant overseer; (4) appointment of trustees, or beneficiaries of a charity; (5) adoption of free libraries, baths and washhouses, and other Acts; (6) place and time of Parish Meeting; (7) the incurring of any expense; (8) applications or complaints to County or District Council; (9) and several other matters.

The Urban District Council.

In small towns and thickly populated districts, such as the suburbs of large towns, the local governing authority is usually an Urban District Council. It has powers and duties very similar to those exercised by the Town Council in large towns, except that it does not control the police. In an Urban District there are no Parish Meetings or Councils. The Rural District Council has no control over it, and its Guardians are separately elected. Urban Districts are usually divided into wards, each of which elects a certain number of members. The members sit for three years, one-third retiring each year; but the County Council may make an order that all the Councillors retire together every third year, if the Urban District Council, by a two-thirds majority of the members voting, applies for it. A chairman must be appointed, who may be elected from outside the Council. A vice-chairman, who must be a

Councillor, may also be appointed. The chairman has a second or casting vote, and, unless a woman, is a J.P. by virtue of his office.

A Councillor can resign by sending a letter to the clerk, but he must pay the fine determined upon by the bye-law of the Council, or failing such a bye-law, the sum of £25. A casual vacancy is filled by a fresh election, unless it occurs within six months of a new election coming in ordinary course, in which case it is not filled.

The Rural District Council.

In all parts of England and Wales outside London, except Boroughs and Urban Districts, there are Rural District Councils. That is to say, wherever there are Parish Councils or Parish Meetings, there are also Rural District Councils. Each of the parishes in any Poor Law Union, except the parishes in towns or urban districts, sends one or more members to its Rural District Council. If there is a contest, the election must be by ballot, and with this election the Parish Meeting has nothing to do. The Councillors sit for three years, and one-third of them retire every year. But the County Council can make an order, if the Rural District Council apply for it, that all the Councillors shall retire together once every three years, and in the great majority of cases this has been done. In these cases the elections usually occur in 1913 and every third year thereafter. The rules as to chairman, vice-chairman, retirement of Councillors, and casual vacancies are exactly the same as for Urban District Councils.

The Board of Guardians.

Boards of Guardians are elected all over England and Wales. In Rural Districts the Rural District Councillors are also Guardians, and, in Unions where there is no Borough or Urban District, the Rural District Council and the Guardians consist of the same persons sitting for different purposes and under different rules. In Unions which contain Urban Districts or Boroughs, the Board of Guardians consists of the Rural District Councillors elected in the Rural Districts, together with Guardians specially elected in the parishes which are in the Boroughs or Urban Districts.

The rule as to period of office is exactly the same as for Rural District Councillors.

The Board may elect a chairman or vice-chairman, or both, and not more than two other persons from outside their own body. But every person so co-opted must be qualified to be a Guardian in the Union. The chairman has a second or casting vote. Casual vacancies are filled in the same manner as in Urban District Councils.

PART III. POWERS.

Powers of the Parish Meeting where there is no Parish Council.

In parishes where there is no Council, the Parish Meeting possesses very nearly all the powers, duties, and rights of a Parish Council, and it can obtain all of them by application to the County Council.

If the parish has at least one hundred inhabitants, it may apply to the County Council for a Parish Council, and the application must be granted. A parish with less than one hundred inhabitants may also apply, but in this case the County Council is not obliged to grant the application.

It may also apply to be grouped with other parishes and so obtain a Parish Council.

The following are most of the powers and duties which the Meeting of a parish without a Council does not possess, but which it may gain by obtaining either a Parish Council or the powers of a Parish Council :—

- (1) Power to acquire land, by purchase or gift, for a recreation ground, for a parish hall, for allotments, or any other purpose.
- (2) The powers and duties of overseers and churchwardens in respect of rating appeals, and in respect of providing parish books, chest, etc., and a fire-engine and fire-escape.
- (3) Power to appoint additional trustees to certain charities, except where there is at present only one trustee.

With these exceptions, the whole of the following paragraphs, dealing with Parish Councils, apply also to parishes which have only a Parish Meeting.

Powers of Parish Councils.

ALLOTMENTS.

It is the business of the Parish Council to find allotments for those who wish them. It may purchase or hire land by a voluntary agreement with the landlord or, if he refuses to come to reasonable terms, the Council can ask the County Council to apply to the Board of Agriculture for an order compelling him to accept the terms, which are to be settled by an arbitrator appointed by the Board; and this arbitrator must not add to the price because of the compulsion. If the County Council will not move, the Parish can appeal to the Board direct. If the land is only to be leased, then the lease must be for not less than fourteen or for more than thirty-five years; but this term can be renewed at the will of the Council. Having acquired the land, the Council can adapt it for use by draining, fencing, road making, erecting buildings (including a dwelling house on any allotment of not less than one acre), and let it out to any one of the laboring population, or to a group of persons working as a co-operative colony, or to an association for the promotion of allotments. The rent must be sufficient to repay all the money that the Council has spent on the land, so that no charge shall ultimately fall on the rates; but a Council may levy a rate or raise a loan to meet the expenses in the first instance. For purchase of land a loan may be obtained from the Government, repayable in 60 years. So long as it repays the expenses, the Council can let as cheaply and on as favorable terms as it pleases. And the tenant in every case can remove any fruit trees or bushes for which he has no claim to compensation on giving up the tenancy. Allotments must not exceed five acres. Rights of common, or land for common pasture can be acquired for the use of allotment holders.

If a Council neglect to consider these matters, any six registered parliamentary electors or resident ratepayers can request (in writing) the Council to discuss the need of the neighborhood. Although these petitioners cannot force the Council to return a favorable answer to a request for land, this petition is a useful step to take, as it forces the Council to state its intentions.

If the Council refuse to provide allotments, the County Council can take over all the allotment powers of the Parish Council, and charge all the expenses on the defaulting Council.

HOUSING.

It is now the duty of Rural District Councils to build cottages under the Housing of the Working Classes Acts, 1890 to 1909, if there are not enough cottages in any village; and it is, by law, the business of Parish Councils and Parish Meetings to see that the Rural District Council does its duty.

The Housing and Town Planning Act, 1909 (sec. 10 (1)) says: "Where a complaint is made to the Local Government Board . . . by the Parish Council or Parish Meeting of any parish comprised in the district, or by any four inhabitant householders in the district," that the Rural District Council has not built houses when they were needed, or closed insanitary dwellings, the Local Government Board may, and in fact frequently does, order a local enquiry to be held, and if the case is proved, the Rural District Council may be compelled to act. The Parish Council or the Parish Meeting may also complain to the County Council that the Rural District Council has failed in its duty to build cottages (sec. 12), and the County Council may (and sometimes does) take over their powers and build the cottages needed at the expense of the district. These powers are new and very valuable. The Housing Acts are much cheaper and easier to work than they were a few years ago, and in villages much more use has recently been made of them than in years gone by.

CHARITIES.

The Parish Council has no control over ecclesiastical charities (which include charities given for sermons or for the benefit of the parson), or buildings used by one religious body, or erected mainly by or at the cost of the members of any particular religious denomination; except that in cases where the overseers used to be trustees, the Council now appoints trustees in their place.

In non-ecclesiastical charities the Parish Council appoints trustees, who hold office for four years, half of them retiring every two years.

The names of the people who receive doles from the charities must be published every year as the Parish Council think fit, and all accounts of charities must be laid before the Parish Meeting every year.

The Parish Council may undertake the management of a charity when the trustees transfer it to them of their own free will, and the Charity Commissioners approve.

Any new scheme affecting a charity must be presented to the Parish Council, or to the Parish Meeting where there is no Council, and they may oppose its being carried out.

But none of the provisions with regard to the appointment of trustees apply to any charities founded since 1854, unless the giver is alive and consents.

No trustee of a charity, his wife, or children may receive any benefit from the charity.

EDUCATION.

The Parish Council and, where there is no Council, the Parish Meeting, has the right to appoint one of the managers to every public elementary school in their area, and they can arrange with their County Council for continuation classes in technical education in the schools, such as gardening (every school should have its garden), bee keeping, woodwork, cookery, laundry work, in all cases for both boys and girls. They can direct their manager to get the School Managers to appoint a Care Committee for looking after the medical treatment and well being of the children. A Report on the Schools, prepared by the Parish Manager, should be presented once a year to the Council and by them to the Annual Parish Meeting.

MEALS FOR SCHOOL CHILDREN.

By the Education (Provision of Meals) Act, 1906, the Education Authority (the County, or in some cases the Urban District, Council) can (1) authorize any committee to provide meals for school children, and may pay for buildings, furniture, apparatus, service, etc., but not for food; (2) where children are underfed the Education Authority may pay for the food. In many parishes there is a great need for hot meals at midday for children coming from a distance, and the parents willingly pay the necessary penny. Parish Councils are the proper bodies to organize such canteens, under the Act, if the County Council consents, or outside it, by voluntary committees, if there is a difficulty in getting legal authority. The Parish Council delegate to the Managing Committee of the Parish School should be instructed by the Council to move in this matter.

RECREATION GROUND.

Every village in England ought to possess a recreation ground for games of all kinds. But owing to the enclosure of village greens, or the fact that it is nobody's business to get them in good condition and keep them so, a great many villages are without any convenient playground. The Parish Council is able to supply the want. It has power to buy, compulsorily if necessary, or to hire land for a recreation ground and to make regulations for its use, and if it is proposed to purchase the land, the money may be raised by loan.

FIRE AND WATER.

Protection against fire is the business of the Council. It can provide a fire engine, fire escape and hose, and organize a fire brigade; it can make arrangements with neighboring authorities to have the use of their appliances.

An unwholesome or insufficient water supply is a very common grievance in villages. It is the duty of the District Council to organize any new supply on a large scale. But the Parish Council may dig wells, put up windmills to pump the water, lay pipes to bring water from a stream up to the houses, and, in fact, make use of

any source of water within the parish in whatever way appears best, provided that they interfere with no one's rights, or that the matter can be arranged by agreement.

It has also power to put right any ill-smelling pond or ditch, and to call the attention of the District Council to any unhealthy cottage or other sanitary fault in the parish. If the District Council does not take action, the County Council may be appealed to, and may undertake the work.

ROADS AND FOOTPATHS.

Similarly, if the District Council does not repair the highways, the Parish Council may ask the County Council to do it instead. The Parish Council may also take steps to prevent any stopping of a right of way or enclosure of common or roadside waste ; but when legal proceedings are necessary the District Council must undertake them. The Parish Council has power to buy by agreement any new right of way that would be of advantage of the people. It may also repair footpaths, except those at the side of the roads, and, if the Parish Meeting consents, it may lay out new walks and put seats along them. But it cannot, except by consent of the landowner, change the permanent condition of a path, for example, by laying down gravel where there has been none before.

THE VILLAGE HALL.

In every parish which can by any means afford it, there should be a hall with a library and reading-room, which should be at once the centre of the village life and interest, a place for all kinds of meetings, and a generally useful means of education. A museum, art gallery, and science and art school may be added. The Parish Meeting must consent to raising the money for such a building, but the Parish Council will have to erect and manage it. The cost will be paid out of the poor-rate, but the Council will have power to borrow for capital outlay. For the library, reading-room, etc., a special vote must be taken and a special rate made under the Public Libraries Act.

OTHER POWERS.

In the same manner the village may be lighted by oil, gas or electricity. Part of a river may be made convenient for a swimming-bath, or a building may be erected for that purpose which could be used in winter as a gymnasium. The Acts for these purposes must be adopted by the Parish Meeting. Fabian Tract No. 137, "Parish Councils and Village Life" (1d.), gives particulars of what has been done by the Parish Councils of many villages.

EXPENSES.

The expenses of the Parish Council are paid out of the poor-rate, but a separate heading must be made to show how much of the rate is for these expenses. The Parish Council may not spend beyond the amount of a threepenny rate without the consent of the Parish Meeting, but with its consent the limit is sixpence in the £. But the cost of lighting the roads, maintaining a library or baths, and one or two other things are not included in this limit. For important undertakings the Parish Council may borrow money with the

consent of the Parish Meeting, the County Council, and the Local Government Board, but not any sum exceeding half the rateable value of the parish. The cost of Parish Meetings and elections to the Parish Council must be paid out of the threepenny rate.

THE PAROCHIAL COMMITTEE.

The Parish Council may ask the Rural District Council to appoint a "Parochial Committee," and to make the Parish Council that Committee, with, perhaps, the addition of the district councillor for that district. Then the Parish Council (besides all its own powers) may exercise within its own parish nearly all the powers that the Rural District Council possesses, if they are delegated to the Parish Committee. The expenses for sewage and water supply will be kept separate, and will be charged on the parish in the poor-rate; but for other matters they will be shared over the whole district, just as if there had been no Parochial Committee, unless the Local Government Board confers powers specially for one parish. Thus the Croydon Rural District Council (Surrey) every year appoints Parochial Committees for five of its parishes, consisting in each case of the members of the Parish Council, together with the Rural District Councillors elected by the parish. These Parochial Committees, meeting in the parishes themselves, practically carry on the government, giving their orders direct to the rural district officials, and making formal reports to the Rural District Council, which are usually confirmed.

Powers of the Rural District Council.

Many of these powers have been referred to in the paragraphs dealing with Parish Councils, especially those connected with right of way, commons and wayside wastes, and water supply. The two chief concerns of the Council are :

1. THE MANAGEMENT OF HIGHWAYS.

The Council has the control of all the roads and bridges in the district, except the main roads, which the County Council manages, and it has the power to make new ones. It appoints the surveyor and employs the laborers required to keep the roads in repair.

2. THE CARE OF PUBLIC HEALTH.

This includes an enormous variety of matters of ever-increasing importance. It is the duty of the Council to undertake :

- (a) The drainage of every village and hamlet in the district.
- (b) Scavenging and removal of dust and refuse wherever required.
- (c) Provision of a proper supply of good water.
- (d) Supervision of cellar-dwellings and inspection of lodging-houses.
- (e) The periodical inspection of all houses.
- (f) The closing of all dwellings unfit for human habitation, and compelling the owners of all insanitary cottages and houses to put and keep them in proper repair.
- (g) The provision of sufficient cottages for the working classes, if there are not enough, under the Housing of the Working Classes Acts, 1890—1909.

- (h) Inspection of shops of butchers and others, to prevent the sale of diseased and unwholesome meat and food, and of adulterated milk, food, or drugs.
- (i) The notification of infectious diseases.
- (j) The provision of hospitals and cemeteries.
- (k) The regulation of canal boats.
- (l) The preparation of town-planning schemes under the Act of 1909.

The Council will also have the duty of licensing gang-masters, pawnbrokers, game-dealers, and knackers' yards, and controlling the sale of petroleum. It has power to take over the control of commons, and to manage them, but the consent of the lord of the manor and the commoners must first be obtained.

To carry out these and other duties, the Council must employ a medical officer, and a sufficient staff of sanitary inspectors.

The Council, by a vote, or ratepayers rated to one-tenth of the rateable value of the district, can apply to the Local Government Board for the additional powers possessed by Urban Sanitary Authorities, which will enable it to deal with offensive trades, streets, new buildings, lighting, public pleasure grounds, cabs, and slaughter-houses.

Powers of the Urban District Councils.

These Councils have (1) all the rights and duties of the Rural District Councils except those which are exercised by a Rural District Council in connection with the Parish Councils of its district. As there are no Parish Councils in an Urban District, these powers and duties cannot exist.

It is the Sanitary Authority, and therefore exercises all the duties connected with the management of highways, and the care of the Public Health set out on page 13, and further, as an Urban Authority, it already has those powers, enumerated above, which a Rural District Council can obtain by application to the Local Government Board. It has nearly all the powers and duties of a Town Council, except the regulation of the police. In an Urban District these powers and duties are usually more important and urgent than in a Rural District, because the population is denser, and often consists almost exclusively of the working class, living in long, dismal streets of small houses.

The Council has the powers, under the Allotments and Small Holdings Act, 1908, which are possessed by Parish Councils for buying or hiring land for allotments. It can obtain, by application to the Local Government Board, all the other powers of a Parish Council, in particular those relating to charities, to the use of rooms, and to appointment of overseers and assistant overseers. It becomes the authority for all the adoptive Acts, as, for instance, those for providing Free Libraries and Baths and Washhouses. It has the power to build artisans' dwellings and cottages with an acre of garden wherever there is a demand for them. It has the right to appoint a manager of every public elementary school in its area, and if its population exceeds 20,000, it becomes the Education Authority and

has large powers and duties. (See Fabian Tract No. 156, "What an Education Committee Can Do : Elementary Schools." 3d.)

It can obtain powers, by private Acts of Parliament and otherwise, to erect, or buy and to manage gas works, electric light works, water works, tramways, markets, and parks.

Powers of the Board of Guardians.

By far the most important duties and powers of the Board of Guardians are the administration of the Poor Laws and the control of Poor Law relief. This is too large a question to be dealt with in this tract. Information on the subject will be found in Fabian Tract No. 54, "The Humanizing of the Poor Law."

The powers and duties of Guardians which are not directly connected with the relief of the poor can alone be touched upon here. They are as follows :—

(1) To determine the total sum required from each parish for relief of the poor of the Union, to hear and determine appeals against any assessment made by any overseer, and generally to be the Rating Authority.

(2) To register births and deaths.

(3) To register and inspect "baby farms" under the Children's Act.

(4) To enforce the Vaccination Acts.

(5) To appoint overseers where the Parish Authority fails to appoint them for three weeks after April 15th in each year.

(6) To act upon any special powers or duties imposed on them by any Act of Parliament.

NOTE.—Women as well as men are referred to in most places in this tract where the words he, his, him only are used.

THE Tenant's Sanitary Catechism

FOR PLACES OUTSIDE LONDON.

THE attention of householders and lodgers is directed to the powers given to local authorities and to the Local Government Board by the Acts mentioned below. Occupiers finding that their houses are not in the sanitary condition prescribed by those Acts, should fill in the answers to the questions printed below in the spaces provided for them, and should then send this paper, either signed by themselves OR NOT, to the Sanitary Inspector for the district, who will be obliged when he receives it to enquire into the matter.

Any person employed in an insanitary workshop may use this form to describe it, and in such cases the form should be sent either to the Sanitary Inspector of the district or to the Factory Inspector, Home Office, Whitehall, S.W., who will cause enquiry to be made.

This leaflet will also be found useful for anyone who is enquiring into the sanitary conditions of any district outside the County of London.

QUESTIONS.	ANSWERS.
<ol style="list-style-type: none"> 1. Name of town or village. 2. Name of local sanitary authority. 3. Name of street and number of house. 4. Name of occupier or occupiers. 5. Name and address of reputed owner. 6. Has the house a water closet or an earth closet or privy for the sole use of its inmates? 7. If not, how many (<i>a</i>) houses and (<i>b</i>) persons use the same closet? 8. If a water closet, is it properly flushed with water from a cistern separate from that used for drinking purposes? 9. Is any of the rooms fitted with a proper sink? Is the sink in sound condition and trapped? 10. Is there a properly constructed dust bin or sanitary pail for the sole use of the inmates? 	

QUESTIONS.

ANSWERS.

11. Is it regularly emptied ?

12. Is the water supply abundant ? Is it constant or intermittent ? If from a well is it so situated and constructed as to be free from contamination ? Are the cisterns, if any, regularly cleaned and in an accessible place for inspection ? Are taps conveniently placed ?

13. Are the floors throughout in a proper state of repair ?

14. Is the roof sound and watertight ?

15. Are the ceilings and walls clean and in repair and free from cracks ?

16. Is any part of the house damp ?

17. Is the back yard properly drained and paved ?

18. Has the house through ventilation or is it a back-to-back house ?

19. If underground rooms are used for sleeping in (*a*) what height are they from floor to ceiling, (*b*) what distance are they below the surface of the street, and (*c*) how are they lighted, ventilated and drained ?

20. How many rooms are there in the house ?

21. Is the house or are any of the rooms so overcrowded as to be dangerous or injurious to the health of the inmates ?

22. Is *any* part of the house in such a condition as to be a nuisance or to be dangerous or injurious to the health of its inmates ?

23. What is the space, back and front, between the house and the nearest buildings ?

24. Are there any works near the house which cause bad smells or noises at night ? Are there any factory chimneys which persistently pour smoke upon this dwelling ?

25. What rent do you pay ?

26. Was the house in proper condition when you became the tenant ?

QUESTIONS.

ANSWERS.

27. What is the size of the garden, if any?

28. Is the supply of good cottages in your district equal to the demand?

(Answers to 27 and 28 will indicate how urgent is the need of further enquiry with a view to forcing the local authority to use its powers to acquire land for small holdings and allotments and for building cottages.)

NOTES.

The following quotations and notes may be found useful.

PUBLIC HEALTH ACT, 1875.

Section 36. If a house within the district of a local sanitary authority appears to such authority . . . to be without sufficient water closet, earth closet, or privy, and an ashpit furnished with proper doors and coverings, the local authority shall by written notice require the owner or occupier of the house . . . to provide a sufficient water closet, etc. . . . Provided that where a water closet, earth closet, or privy has been and is used in common by the inmates of two or more houses, or if, in the opinion of the local authority, . . . may be so used, they need not require the same to be provided for each house.

(N.B. But the local authority should insist on each house having its own closet.)

Section 40 says that every local authority shall see that all drains, water closets, etc., within their districts are constructed and kept so as not to be a nuisance or injurious to health.

Section 41 gives the local authority power to charge the owner of a house the cost of putting the drains thereof in order.

Section 46. Where on the certificate of the medical officer of health or of any two medical practitioners it appears to any local authority that any house or part thereof is in such a filthy or unwholesome condition that the health of any person is affected or endangered thereby, or that the whitewashing, cleansing, or purifying of any house, etc., would tend to prevent or check infectious disease, the local authority shall give notice in writing to the owner of such house, etc., to whitewash, cleanse, or purify the same. . . .

Section 62 empowers the local authority to require houses to be supplied with water.

Section 90 gives the Local Government Board power to allow a local authority to make byelaws as to houses let in lodgings.

Section 91 defines a nuisance liable to be dealt with summarily under the Act as:

- (1) Any premises in such a state as to be a nuisance or injurious to health;
- (2) Any pool, ditch, gutter, watercourse, privy, urinal, cesspool, drain, or ashpit so foul or in such a state as to be a nuisance or injurious to health;
- (3) Any animal so kept as to be a nuisance, etc.;
- (4) Any accumulation or deposit which is a nuisance, etc.;
- (5) Any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates, whether or not members of the same family; *

* Overcrowding is defined in the Model Byelaws as being more than one adult to three hundred cubic feet of air space. Two children equal one adult.

(8) Any chimney (not being the chimney of a private dwelling house) sending forth black smoke in such quantity as to be a nuisance.

Section 109 provides that on a second conviction within three months for overcrowding, the local authority may apply to a court of summary jurisdiction for a closing order for such time as the court may think necessary.

Section 157 gives power to urban local authorities to make various building bye-laws to secure sanitary dwellings and to close buildings or parts of buildings in which the drainage, sanitary conveniences, etc., make them unfit for human habitation.

Section 114 says that if any house is rendered unfit for human habitation through offensive effluvia arising from any factory adjoining, any ten inhabitants in an urban district may complain to the local authority, who shall enquire into and abate it. A heavy fine may be imposed.

HOUSING OF THE WORKING CLASSES ACT, 1890.

Section 31. Any four householders in or near a street may complain in writing of the condition of any house or houses in that street, and the medical officer of health will then be compelled to inspect and report on their condition to the local authority.

Section 38 gives power to the local authority to order the removal of any building which, though not in itself unfit for human habitation, causes an obstruction to other buildings by stopping ventilation, impeding light, or preventing necessary improvements to such other buildings from being carried out.

HOUSING, TOWN PLANNING, ETC., ACT, 1909.

Sections 14, 15, 16, 17, and 18 give extended powers to local authorities for keeping houses in repair and closing or demolishing insanitary dwellings. The duty of making from time to time a house to house inspection is placed upon the local authority. The local authority having served an order upon any landlord for necessary repairs, etc., may in the event of their not being carried out within the time specified in the order, do the work itself and recover the cost from the landlord. Further, the landlord of a house in a borough or urban district with a population of fifty thousand or more at a rent not exceeding twenty-six pounds, or in any other district at a rent not exceeding eight pounds, is bound to make it "in all respects reasonably fit for human habitation" before letting it, and afterwards to keep it so; and damages may be recovered from him if he neglects to do so and the tenant suffers thereby. Further, the local authority may in such cases put the house in proper condition and charge the landlord with the cost. The local authority under this Act make orders with regard to the closing and demolition of houses unfit for human habitation instead of applying to a magistrate for such orders. Any owner may appeal to the Local Government Board. The local authority may pay to any occupier of property against which a closing order is made a reasonable sum to cover the cost of removal, and this sum may be recovered from the owner.

Section 10 provides that if the local authority refuses to take steps to deal with insanitary property, any four inhabitant householders in the district (whether in the same parish or not) may appeal to the Local Government Board, who may thereupon order a public enquiry, and as a result of such enquiry may make an order directing the local authority to take the necessary steps. In the case of a rural sanitary authority, an appeal to the Local Government Board may also be made by the county council, parish council, or parish meeting, or by four inhabitant householders.

Section 17 (7) provides that an underground room used as a sleeping place shall be deemed unfit for human habitation if it is more than three feet below the surface of the street and not on the average seven feet from floor to ceiling, and if, further, it does not comply with the regulations made by the local authority for proper ventilation, drainage, etc. Such regulations must be made by the local authority when required to do so by the Local Government Board, and must be approved by the Local Government Board. Underground rooms not complying with these regulations are not necessarily closed for other purposes than use as sleeping places.

Section 43 prohibits from the time of the passing of this Act the building of back to back houses.

The Housing, Town Planning, etc., Act, 1909, and the Small Holdings Act, 1908, have greatly increased the powers of local authorities, both rural and urban, to acquire land and build houses. Information as to these powers will be found in other leaflets and pamphlets.

Any Act of Parliament may be obtained for a few pence from P. S. King & Son, Great Smith Street, Westminster, S.W.

Fabian Tract No. 69.

THE DIFFICULTIES OF INDIVIDUALISM.

BY SIDNEY WEBB.

PUBLISHED AND SOLD BY
THE FABIAN SOCIETY.

PRICE ONE PENNY.

LONDON :

THE FABIAN SOCIETY, 25 TOTHILL STREET, WESTMINSTER, S.W.

PUBLISHED JUNE 1896. FOURTH REPRINT NOVEMBER 1914.

THE DIFFICULTIES OF INDIVIDUALISM.*

OF all the intellectual difficulties of Individualism, the greatest, perhaps, is that which is presented by the constant flux of things. Whatever may be the advantages and conveniences of the present state of society, we are, at any rate, all of us, now sure of one thing—that it cannot last.

The Constant Evolution of Society.

We have learnt to think of social institutions and economic relations as being as much the subjects of constant change and evolution as any biological organism. The main outlines of social organization, based upon the exact sphere of private ownership in England to-day, did not “come down from the Mount.”

The very last century has seen an almost complete upsetting of every economic and industrial relation in the country, and it is irrational to assume that the existing social order, thus new-created, is destined inevitably to endure in its main features unchanged and unchangeable. History did not stop with the last great convulsion of the Industrial Revolution, and Time did not then suddenly cease to be the Great Innovator. Nor do the Socialists offer us a statical heaven to be substituted for an equally statical world here present. English students of the last generation were accustomed to think of Socialism as a mere Utopia, spun from the humanity-intoxicated brains of various Frenchmen of the beginning of this century. Down to the present generation every aspirant after social reform, whether Socialist or Individualist, naturally embodied his ideas in a detailed plan of a new social order, from which all contemporary evils were eliminated. Bellamy is but a belated Cabet, Babœuf, or Campanella. But modern Socialists have learnt the lesson of evolution better than their opponents, and it cannot be too often repeated that Socialism, to Socialists, is not a Utopia which they have invented, but a principle of social organization which they assert to have been discovered by the patient investigators into sociology whose labors have distinguished the present century. That principle, whether true or false, has, during a whole generation, met with an ever-increasing, though often unconscious, acceptance by political administrators.

* Reprinted, with minor changes, from the *Economic Journal* for June 1891.

Thus, it is the constant flux of things which underlies all the "difficulties" of Individualism. Whatever we may think of the existing social order, one thing is certain—namely, that it will undergo modification in the future as certainly and steadily as in the past. Those modifications will be partly the result of forces not consciously initiated or directed by human will. Partly, however, the modifications will be the results, either intended or unintended, of deliberate attempts to readjust the social environment to suit man's real or fancied needs. It is therefore not a question of *whether* the existing social order shall be changed, but of *how* this inevitable change shall be made.

"Social Problems."

In the present phase of acute social compunction, the maladjustments which occasion these modifications appear to us in the guise of "social problems." But whether or not they are the subjects of conscious thought or conscious action, their influence is perpetually at work, silently or obtrusively modifying the distribution of social pressure, and altering the weft of that social tissue of which our life is made. The characteristic feature of our own age is not this constant evolution itself—for that, of course, is of all time—but our increasing consciousness of it. Instead of unconscious factors we become deliberate agents, either to aid or resist the developments coming to our notice. Human selection accordingly becomes the main form of natural selection, and functional adaptation replaces the struggle for existence as the main factor in social progress. Man becomes the midwife of the great womb of Time, and necessarily undertakes the responsibility for the new economic relations which he brings into existence.

Hence the growing value of correct principles of social action, of valid ideals for social aspiration. Hence, therefore, the importance, for weal or for woe, of the change in social ideals and principles which marks off the present generation of Socialists from the surviving economists and statesmen brought up in the "Manchester school." We may, of course, prefer not to accept the watchwords or shibboleths of either party; we may carefully guard ourselves against "the falsehood of extremes"; we may believe that we can really steer a middle course. This comforting reflection of the practical man is, however, an unphilosophical delusion. As each difficulty of the present day comes up for solution, our action or inaction must, for all our caution, necessarily incline to one side or the other. We may help to modify the social organism either in the direction of a more general Collectivism or in that of a more perfect Individualism; it will be hard, even by doing nothing, to leave the balance just as it was. It becomes, accordingly, of vital importance to examine not only our practical policy but also our ideals and principles of action, even if we do not intend to follow these out to their logical conclusion.

Individualism and Collectivism.

It is not easy, at the present day, to be quite fair to the opinions of the little knot of noble-minded enthusiasts who broke for us the chains of the oligarchic tyranny of the eighteenth century. Their work was essentially destructive, and this is not the place in which to estimate how ably they carried on their statical analysis, or how completely they misunderstood the social results of the industrial revolution which was falsifying all their predictions almost before they were uttered. But we may, perhaps, not unfairly sum up as follows the principles which guided them in dealing with the difficulties of social life: that the best government is that which governs least; that the utmost possible scope should be allowed to untrammelled individual enterprise; that open competition and complete freedom from legal restrictions furnish the best guarantees of a healthy industrial community; that the desired end of "equality of opportunity" can be ultimately reached by allowing to each person the complete ownership of any riches he may become possessed of; and that the best possible social state will result from each individual pursuing his own interest in the way he thinks best.

Fifty years' further social experience have destroyed the faith of the world in the validity of these principles as the basis of even a decent social order, and Mr. John Morley himself has told us* that "the answer of modern statesmanship is that unfettered individual competition is not a principle to which the regulation of industry may be intrusted."

"It is indeed certain," sums up Dr. Ingram, at the end of his comprehensive survey of all the economic tendencies, "that industrial society will not permanently remain without a systematic organization. The mere conflict of private interests will never produce a well-ordered commonwealth of labor."†

Modern Socialism is, accordingly, not a faith in an artificial Utopia, but a rapidly-spreading conviction, as yet only partly conscious of itself, that social health and consequently human happiness is something apart from and above the separate interests of individuals, requiring to be consciously pursued as an end in itself; that the lesson of evolution in social development is the substitution of consciously regulated co-ordination among the units of each organism for their internecine competition;‡ that the production and distribution of wealth, like any other public function, cannot safely be intrusted to the unfettered freedom of individuals, but needs to be organized and controlled for the benefit of the whole community; that this can be imperfectly done by means of legislative restriction and taxation, but is eventually more advantageously accomplished through the collective enterprise of the appropriate administrative

unit in each case ; and that the best government is accordingly that which can safely and successfully administer most.

The New Pressure for Social Reform.

But although the principles of Individualism have long been tacitly abandoned by our public men, they have remained, until quite recently, enshrined in the imagination of the middle class citizen and the journalist. Their rapid supersession in these days, by principles essentially Socialist, is due to the prominence now given to "social problems," and to the failure of Individualism to offer any practicable solution of these. The problems are not in themselves new ; they are not even more acute or pressing than of yore ; but the present generation is less disposed than its predecessors to acquiesce in their insolubility. This increasing social compunction in the presence of industrial disease and social misery is the inevitable result of the advent of political democracy. The power to initiate reforms is now rapidly passing into the hands of those who themselves directly suffer from the evils to be removed ; and it is therefore not to be wondered at that social re-organization is a subject of much more vital interest to the proletarian politicians of to-day than it can ever have been to the University professors or Whig proprietors of the past.

Now the main "difficulties" of the existing social order, with which Individualist principles fail to deal, are those immediately connected with the administration of industry and the distribution of wealth. To summarize these difficulties before examining them, we may say that the Socialist asserts that the system of private property in the means of production permits and even promotes an extreme inequality in the distribution of the annual product of the united labors of the community. This distribution results in excess in the hands of a small class, balanced by positive privation at the other end of the social scale. An inevitable corollary of this unequal distribution is wrong production, both of commodities and of human beings ; the preparation of senseless luxuries whilst there is need for more bread, and the breeding of degenerate hordes of a demoralized "residuum" unfit for social life. This evil inequality and disastrous malproduction are enabled to continue through the individual ownership of the instruments of industry, one inevitable accompaniment of which is the continuance, in the commercial world, of that personal rule which is rapidly being expelled from political administration. The increasing integration of the Great Industry is, indeed, creating—except in so far as it is counteracted by the adoption of Socialist principles—a kind of new feudalism, based upon tenure, not of land, but of capital employed in the world-commerce, a financial autocracy against which the democracy sullenly revolts. In the interests of this oligarchy, the real interests of each community tend to be ignored, to the detriment of its capacity to hold its own in the race struggle—that competition between communities rather than between individuals in a community which is perhaps now becoming the main field of natural selection.

In examining each of these difficulties in greater detail, it will be fair to consider, not only how far they can be solved by the existing order and in what way they are actually being dealt with by the application of Socialist principles, but also what hope might, on the other hand, be found in the greatest possible development of Individualism. For to-day it is the Individualist who is offering us, as a solution of social difficulties, an untried and nebulous Utopia ; whilst the Socialist occupies the superior position of calling only for the conscious and explicit adoption and extension of principles of social organization to which the stern logic of facts has already driven the practical man. History and experiment have indeed changed sides, and rank now among the allies of the practical Socialist reformer. Factory Acts and municipal gas-works we know, but the voice of Mr. Auberon Herbert, advocating "voluntary taxation," is as the voice of one crying in the wilderness.

Inequality of Income.

Inequality in wealth distribution is, of course, no new thing, and it is unnecessary to contend that the inequality of the present age is more flagrant than that of its predecessors. The extreme depth of poverty of those who actually die of starvation is, indeed, obviously no less than before; and when 30 per cent. of the five million inhabitants of London are found to be inadequately supplied with the bare necessities of life, and probably a fourth of the entire community become paupers at 65, it would profit us little to enquire whether this percentage is greater or less than that during the Middle Ages. On the other hand, the wealth production of the community advances by leaps and bounds, being now far greater than ever it was, and greater than that of any other country of the Old World. The riches of a comparatively small number of the owners of our land and capital are colossal and increasing.

Nor is there any doubt or dispute as to the causes of this inequality. The supersession of the Small by the Great Industry has given the main fruits of invention and the new power over Nature to a comparatively small proprietary class, upon whom the mass of the people are dependent for leave to earn their living. When it suits any person having the use of land and capital to employ the worker, this is only done on condition that two important deductions, rent and interest, can be made from his product, for the benefit of two, in this capacity, absolutely unproductive classes—those exercising the bare ownership of land and capital. The reward of labor being thus reduced, on an average, by about one-third, the remaining eightpence out of the shilling is then shared between the various classes who *have* co-operated in the production—including the inventor, the managing employer, and the mere wage-worker—but shared in the competitive struggle in such a way that at least fourpence goes to a favored set of educated workers, numbering less than one-fifth of the whole, leaving four-fifths to divide less than fourpence out of the shilling between them. The consequence is the social condition we see around us. A fortunate few, owing to

their legal power over the instruments of wealth-production, command the services of thousands of industrial slaves whose faces they have never seen, without rendering any service to them or to society in exchange. A larger body of persons contribute some labor, but are able, from their cultivated ability or special education, to choose occupations for which the competition wage is still high, owing to the small number of possible competitors. These two classes together number only one-fifth of the whole. On the other hand is the great mass of the people, the weekly wage-earners, four out of five of the whole population, toiling perpetually for less than a third of the aggregate product of labor, at an annual wage averaging at most £40 per adult, hurried into unnecessarily early graves by the severity of their lives, and dying, as regards at least one-third of them, destitute or actually in receipt of poor-law relief.

Few can doubt the fundamental causes of this inequality of condition. The abstraction from the total of over one-third of the product necessarily makes a serious inroad in that which the "niggardliness of Nature" allows us, and the distribution of the remaining two-thirds is, of course, itself fatally affected by the secondary results of the division into "two nations" which the private appropriation of rent and interest creates.

Can we Dodge the Law of Rent?

Individualists may tell us of the good things that the worker could get for himself by thrift and sobriety, prudence and saving, but no economist will for a moment suggest that any conceivable advance in these virtues would remove the fundamental inequality arising from the phenomenon of rent. The mere worker, *quâ* worker, is necessarily working, as far as its own remuneration is concerned, on the very worst land in economic use, with the very minimum advantage of industrial capital. Every development towards a freer Individualism must, indeed, inevitably emphasize the power of the owner of the superior instruments of wealth-production to obtain for himself all the advantages of their superiority. Individualists may prefer to blink this fact, and to leave it to be implied that, somehow or other, the virtuous artizan can dodge the law of rent. But against this complacent delusion of the philanthropist political economy emphatically protests. So long as the instruments of production are in unrestrained private ownership, so long must the tribute of the workers to the drones continue: so long will the toilers' reward inevitably be reduced by their exactions. No tinkering with the land laws can abolish or even diminish economic rent, however much it may result in the redistribution of this tribute. The *whole* equivalent of every source of fertility or advantage of all land over and above the worst in economic use is under free competition necessarily abstracted from the mere worker on it. So long as Lady Matheson can "own" the island of Lewis, and (as she says) do what she likes with her own—so long as the Earls of Derby can appropriate at their ease the unearned increment of Bootle or Bury—it is the very emphatic teaching of political economy that the

earth may be the Lord's, but the fulness thereof must inevitably be the landlord's.

There is an interesting episode in English history among James I.'s disputes with the Corporation of London, then the protector of popular liberties. James, in his wrath, threatened to remove the Court to Oxford. "Provided only your Majesty leave us the Thames," cleverly replied the Lord Mayor. But economic dominion is more subtle than kingcraft—our landlords steal from us even the Thames. No Londoner who is not a landlord could, under completely free Individualism, obtain one farthing's worth of economic benefit from the existence of London's ocean highway; the whole equivalent of its industrial advantage would necessarily go to swell the compulsory tribute of London's annual rental.

It has often been vaguely hoped that this iron law was true only of land, and that, in some unexplained way, the worker did get the advantage of other forms of industrial capital. But further economic analysis shows, as Whately long ago hinted, that rent is a genus of which land rent is only one species. The worker in the factory is now seen to work no shorter hours or gain no higher wages merely because the product of his labor is multiplied a hundred-fold by machinery which he does not own.

Whatever may be the effect of invention on the wages of one generation as compared with the last, it has now become more than doubtful to economists whether the worker can count on getting any more of the product of the machine, in a state of "complete personal liberty," than his colleague contemporaneously laboring at the very margin of cultivation with the very minimum of capital. The artizan producing boots by the hundred in the modern machine works of Southwark or Northampton gets no higher wages than the surviving hand cobbler in the by-street. The whole differential advantage of all but the worst industrial capital, like the whole differential advantage of all but the worst land, necessarily goes to him who legally owns it. The mere worker can have none of them. "The remuneration of labor, as such," wrote Cairnes in 1874,* "skilled or unskilled, can never rise much above its present level."

The "Population Question."

Neither can we say that it is the increase of population which effects this result. During the present century, indeed, in spite of an unparalleled increase in numbers, the wealth annually produced in England *per head* has nearly doubled.† If population became stationary to-morrow, and complete personal liberty prevailed, with any amount of temperance, prudence, and sympathy, the present rent and interest would not be affected; our numbers determine,

* *Some Leading Principles*, p. 348.

† Hence the remarkable suppression of "Malthusianism" in all recent economic literature, notably the handbooks of Symes, Cannan, Ely, and Gonner; and its significantly narrow subordination in Prof. Marshall's *Principles of Economics*. The birth-rate of Great Britain is now apparently lower than it has ever been during the whole of the past century, and it seems tending steadily downwards.

indeed, how bad the margin of cultivation will be, and this is of serious import enough; but, increase or no increase, the private ownership of land and capital necessarily involves the complete exclusion of the mere worker, as such, from all the economic advantages of the fertile soil on which he is born, and of the buildings, machinery, and railways he finds around him.

The "Wickedness" of Making any Change.

Few Individualists, however, now attempt to deny the economic conclusion that the private ownership of land and capital necessarily involves a serious *permanent* inequality in the distribution of the annual product of the community; and that this inequality bears no relation to the relative industry or abstinence of the persons concerned. They regard it, however, as impossible to dispossess equitably those who now levy the tribute of rent and interest, and they are therefore driven silently to drop their original ideal of equality of opportunity, and to acquiesce in the *perpetual* continuance of the inequality which they vainly deplore. It is immoral, we are told, to take any step, by taxation or otherwise, which would diminish even by a trifle the income of the present owners of the soil and their descendants for ever and ever. This cannot be done without sheer confiscation, which would be none the less confiscation because carried out gradually and under the guise of taxation.

The problem has, however, to be faced. Either we must submit for ever to hand over at least one-third of our annual product to those who do us the favor to own our country, without the obligation of rendering any service to the community, and to see this tribute augment with every advance in our industry and numbers, or else we must take steps, as considerately as may be possible, to put an end to this state of things. Nor does equity yield any such conclusive objection to the latter course. Even if the infant children of our proprietors have come into the world booted and spurred, it can scarcely be contended that whole generations of their descendants yet unborn have a vested interest to ride on the backs of whole generations of unborn workers. Few persons will believe that this globe must spin round the sun for ever charged with the colossal mortgage implied by private ownership of the ground-rents of great cities, merely because a few generations of mankind, over a small part of its area, could at first devise no better plan of appropriating its surface.

There is, indeed, much to be said in favor of the liberal treatment of the present generation of proprietors, and even of their children. But against the permanent welfare of the community the unborn have no rights; and not even a living proprietor can possess a vested interest in the existing system of taxation. The democracy may be trusted to find, in dealing with the landlord, that the resources of civilization are not exhausted. An increase in the death duties, the steady rise of local rates, the special taxation of urban ground values, the graduation and differentiation of the income-tax, the simple appropriation of the unearned increment, and the gradual acquire-

ment of land and other monopolies by public authorities, will in due course suffice to "collectivize" the bulk of the tribute of rent and interest in a way which the democracy will regard as sufficiently equitable even if it does not satisfy the conscience of the proprietary class itself. This growth of collective ownership it is, and not any vain sharing out of property, which is to achieve the practical equality of opportunity at which democracy aims.

Why Inequality is Bad.

Individualists have been driven, in their straits, to argue that inequality in wealth is in itself a good thing, and that the objection to it arises from the vain worship of a logical abstraction. But Socialists (who on this point are but taking up the old Radical position) base their indictment against inequality, not on any metaphysical grounds, but on the plain facts of its effect upon social life. The inequality of income at the present time obviously results in a flagrant "wrong production" of commodities. The unequal value of money to our paupers and our millionaires deprives the test of "effective demand" of all value as an index to social requirements, or even to the production of individual happiness. The last glass of wine at a plutocratic orgy, which may be deemed not even to satisfy any desire, is economically as urgently "demanded" as the whole day's maintenance of the dock laborer for which its cost would suffice. Whether London shall be provided with an Italian Opera, or with two Italian Operas, whilst a million of its citizens are without the means of decent life, is now determined, not with any reference to the genuine social needs of the capital of the world, or even by any comparison between the competing desires of its inhabitants, but by the chance vagaries of a few hundred wealthy families. It will be hard for the democracy to believe that the conscious public appropriation of municipalized rent would not result in a better adjustment of resources to needs, or, at any rate, in a more general satisfaction of individual desires, than this Individualist appropriation of personal tribute on the labors of others.

The Degradation of Character.

A more serious result of the inequality of income caused by the private ownership of land and capital is its evil effect on human character and the multiplication of the race. It is not easy to compute the loss to the world's progress, the degradation of the world's art and literature, caused by the demoralization of excessive wealth. Equally difficult would it be to reckon up how many potential geniuses are crushed out of existence by lack of opportunity of training and scope. But a graver evil is the positive "wrong-population" which is the result of extreme poverty and its accompanying insensibility to all but the lowest side of human life. In a condition of society in which the *average* family income is but a little over £3 per week, the deduction of rent and interest for the benefit of a small class necessarily implies a vast majority of the population below the level of decent existence. The slums at the

East End of London are the corollary of the mansions at the West End. The depression of the worker to the product of the margin of cultivation often leaves him nothing but the barest livelihood. No prudential considerations appeal to such a class. One consequence is the breeding in the slums of our great cities, and the overcrowded hovels of the rural poor, of a horde of semi-barbarians, whose unskilled labor is neither required in our present complex industrial organism, nor capable of earning a maintenance there. It was largely the recognition that it was hopeless to expect to spread a Malthusian prudence among this residuum that turned John Stuart Mill into a Socialist; and if this solution be rejected, the slums remain to the Individualist as the problem of the Sphinx, which his civilization must solve or perish.

The Loss of Freedom.

It is less easy to secure adequate recognition of the next, and in many respects the most serious "difficulty" of Individualism—namely, its inconsistency with democratic self-government. The Industrial Revolution with its splendid conquests over Nature, opened up a new avenue of personal power for the middle class, and for every one who could force his way into the ranks either of the proprietors of the new machines, or of the captains of industry whom they necessitated. The enormous increase in personal power thus gained by a comparatively small number of persons, they and the economists not unnaturally mistook for a growth in general freedom. Nor was this opinion wholly incorrect. The industrial changes were, in a sense, themselves the result of progress in political liberty. The feudal restrictions and aristocratic tyranny of the eighteenth century gave way before the industrial spirit, and the politically free laborer came into existence. But the economic servitude of the worker did not disappear with his political bondage. With the chains of innate status there dropped off also its economic privileges, and the free laborer found himself in a community where the old common rights over the soil were being gradually but effectually extinguished. He became a landless stranger in his own country. The development of competitive production for sale in the world market, and the supremacy of the machine industry, involved moreover, in order to live, not merely access to the land, but the use, in addition, of increasingly large masses of capital—at first in agriculture, then foreign trade, then in manufacture, and finally now also in distributive industries. The mere worker became steadily less and less industrially independent as his political freedom increased. From a self-governing producing unit, he passed into a mere item in a vast industrial army over the organization and direction of which he had no control. He was free, but free only to choose to which master he would sell his labor—free only to decide from which proprietor he would beg that access to the new instruments of production without which he could not exist.

In an age of the Small Industry there was much to be said for the view that the greatest possible personal freedom was to be

obtained by the least possible collective rule. The peasant on his own farm, the blacksmith at his own forge, needed only to be let alone to be allowed to follow their own individual desires as to the manner and duration of their work. But the organization of workers into huge armies, the directing of the factory and the warehouse by skilled generals and captains, which is the inevitable outcome of the machine industry and the world-commerce, have necessarily deprived the average workman of the direction of his own life or the management of his own work. The middle class student, over whose occupation the Juggernaut Car of the Industrial Revolution has not passed, finds it difficult to realize how sullenly the workman resents his exclusion from all share in the direction of the industrial world. This feeling is part of the real inwardness of the demand for an Eight Hours Bill.

The ordinary journalist or member of Parliament still says: "I don't consult any one except my doctor as to my hours of labor. That is a matter which each grown man must settle for himself." We never hear such a remark from a working man belonging to any trade more highly organized than chimney-sweeping. The modern artisan has learnt that he can no more fix for himself the time at which he shall begin and end his work than he can fix the sunrise or the tides. When the carrier drove his own cart and the weaver sat at his own loom they began and left off work at the hours that each preferred. Now the railway worker or the power-loom weaver knows that he must work the same hours as his mates.

It was this industrial autocracy that the Christian Socialists of 1850 sought to remedy by re-establishing the "self-governing workshop" of associated craftsmen; and a similar purpose still pervades the whole field of industrial philanthropy. Sometimes it takes the specious name of "industrial partnership"; sometimes the less pretentious form of a joint-stock company with one-pound shares. In the country it inspires the zeal for the creation of peasant proprietorships, or the restoration of "village industries," and behind it stalk those bogus middle class "reforms" known as "free land" and "leasehold enfranchisement." But it can scarcely be hidden from the eyes of any serious student of economic evolution that all these well-meant endeavors to set back the industrial clock are, as regards any widespread result, foredoomed to failure.

The growth of capital has been so vast, and is so rapidly increasing, that any hope of the great mass of the workers ever owning under any conceivable Individualist arrangements the instruments of production with which they work can only be deemed chimerical.*

* The estimated value of the wealth of the United Kingdom to-day is 10,000 millions sterling, or over £1,100 per family. The co-operative movement controls about 13 millions sterling. The total possessions of the 31 millions of the wage-earning class are less than 250 millions sterling, or not £7 capital per family. The eight millions of the population who do not belong to the wage-earning class own all the rest; the death duty returns show, indeed, that one-half of the entire total is in the hands of about 25,000 families. For references to the authorities for these and other statistics quoted, see Fabian Tract No. 5, *Facts for Socialists*.

Hence it is that irresponsible personal authority over the actions of others—expelled from the throne, the castle, and the altar—still reigns, almost unchecked, in the factory and the mine. The “captains of industry,” like the kings of yore, are indeed honestly unable to imagine how the business of the world can ever go on without the continuance of their existing rights and powers. And truly, upon any possible development of Individualistic principles, it is not easy to see how the worker can ever escape from their “beneficent” rule.

The Growth of Collective Action.

But representative government has taught the people how to gain collectively that power which they could never again individually possess. The present century has accordingly witnessed a growing demand for the legal regulation of the conditions of industry which represents a marked advance on previous conceptions of the sphere of legislation. It has also seen a progress in the public management of industrial undertakings which represents an equal advance in the field of government administration. Such an extension of collective action is, it may safely be asserted, an inevitable result of political democracy. When the Commons of England had secured the right to vote supplies, it must have seemed an unwarrantable extension that they should claim also to redress grievances. When they passed from legislation to the exercise of control over the executive, the constitutional jurists were aghast at the presumption. The attempt of Parliament to seize the command of the military forces led to a civil war. Its control over foreign policy is scarcely two hundred years old. Every one of these developments of the collective authority of the nation over the conditions of its own life was denounced as an illegitimate usurpation foredoomed to failure. Every one of them is still being resisted in countries less advanced in political development. In England, where all these rights are admitted, each of them inconsistent with the “complete personal liberty” of the minority, the Individualists of to-day deny the competence of the people to regulate, through their representative committees, national or local, the conditions under which they work and live. Although the tyranny which keeps the tramcar conductor away from his home for seventeen hours a day is not the tyranny of king or priest or noble, he feels that it is tyranny all the same, and seeks to curb it in the way his fathers took.

The captains of war have been reduced to the position of salaried officers acting for public ends under public control; and the art of war has not decayed. In a similar way the captains of industry are gradually being deposed from their independent commands, and turned into salaried servants of the public. Nearly all the railways of the world, outside of America and the United Kingdom, are managed in this way. The Belgian Government works its own line of passenger steamers. The Paris Municipal Council opens public bakeries. The Glasgow Town Council runs its own common lodging houses, Plymouth its own tramways. Everywhere, schools, water

works, gas-works, dwellings for the people, and many other forms of capital, are passing from individual into collective control. And there is no contrary movement. No community which has once "municipalized" any public service ever retraces its steps or reverses its action.

Such is the answer that is actually being given to this difficulty of Individualism. Everywhere the workman is coming to understand that it is practically hopeless for him, either individually or co-operatively, to own the constantly growing mass of capital by the use of which he lives. Either we must, under what is called "complete personal freedom," acquiesce in the personal rule of the capitalist, tempered only by enlightened self-interest and the "gift of sympathy," or we must substitute for it, as we did for the royal authority, the collective rule of the whole community. The decision is scarcely doubtful. And hence we have on all sides, what to the Individualist is the most incomprehensible of phenomena, the expansion of the sphere of government in the interests of liberty itself. Socialism is, indeed, nothing but the extension of democratic self-government from the political to the industrial world, and it is hard to resist the conclusion that it is an inevitable outcome of the joint effects of the economic and political revolutions of the past century.

Competition.

Individualists often take refuge in a faith that the extension of the proprietary class, and the competition of its members, will always furnish an adequate safeguard against the tyranny of any one of them. But the monopoly of which the democracy is here impatient is not that of any single individual, but that of the class itself. What the workers are objecting to is, not the rise of any industrial Buonaparte financially domineering the whole earth—though American experience makes even this less improbable than it once was—but the creation of a new feudal system of industry, the domination of the mass of ordinary workers by a hierarchy of property owners, who compete, it is true, among themselves, but who are nevertheless able, as a class, to preserve a very real control over the lives of those who depend upon their own daily labor.

Moreover, competition, where it still exists, is in itself one of the Individualist's difficulties, resulting, under a system of unequal incomes, not merely in the production, as we have seen, of the wrong commodities, but also of their production in the wrong way and for the wrong ends. The whole range of the present competitive Individualism manifestly tends, indeed, to the glorification, not of honest personal service, but of the pursuit of personal gain—not the production of wealth, but the obtaining of riches. The inevitable outcome is the apotheosis, not of social service, but of successful financial speculation, which is already the special bane of the American civilization. With it comes inevitably a demoralization of personal character, a coarsening of moral fibre, and a hideous lack of taste.

The Lesson of Evolution.

This, indeed, is the lesson which economics brings to ethics. The "fittest to survive" is not necessarily the best, but much more probably he who takes the fullest possible advantage of the conditions of the struggle, heedless of the result to his rivals. Indeed, the social consequences of complete personal liberty in the struggle for existence have been so appalling that the principle has had necessarily to be abandoned. It is now generally admitted to be a primary duty of government to prescribe the plane on which it will allow the struggle for existence to be fought out, and so to determine which kind of fitness shall survive. We have long ruled out of the conflict the appeal to brute force, thereby depriving the stronger man of his natural advantage over his weaker brother. We stop as fast as we can every development of fraud and chicanery, and so limit the natural right of the cunning to overreach their neighbors. We prohibit the weapon of deceptive labels and trade marks. In spite of John Bright's protest, we rule that adulteration is not a permissible form of competition. We forbid slavery: with Mill's consent, we even refuse to enforce a lifelong contract of service. We condemn long hours of labor for women and children, and now even for adult men, and insanitary conditions of labor for all workers.

The whole history of social progress is, indeed, one long series of definitions and limitations of the conditions of the struggle, in order to raise the quality of the fittest who survive. This service can be performed only by the government. No individual competitor can lay down the rules of the combat. No individual can safely choose the higher plane so long as his opponent is at liberty to fight on the lower. In the face of this experience, the Individualist proposal to rely on complete personal liberty and free competition is not calculated to gain much acceptance. A social system devised to encourage "the art of establishing the maximum inequality over our neighbors"—as Ruskin puts it—appears destined to be replaced, wherever this is possible, by one based on salaried public service, with the stimulus of duty and esteem, instead of that of fortune-making.

The Struggle for Existence between Nations.

But perhaps the most serious difficulty presented by the present concentration of energy upon personal gain is its effect upon the position of the community in the race struggle. The lesson of evolution seems to be that interracial competition is really more momentous in its consequences than the struggle between individuals. It is of comparatively little importance, in the long run, that individuals should develop to the utmost, if the life of the community in which they live is not thereby served. Two generations ago it would have been assumed, as a matter of course, that the most efficient life for each community was to be secured by each individual in it being left complete personal freedom. But that

crude vision has long since been demolished. Fifty years' social experience have convinced every statesman that, although there is no common sensorium, a society is something more than the sum of its members; that a social organism has a life and health distinguishable from those of its individual atoms. Hence it is that we have had Lord Shaftesbury warning us that without Factory Acts we should lose our textile trade; Matthew Arnold, that without national education we were steering straight into national decay; and finally even Professor Huxley taking up the parable that, unless we see to the training of our residuum, France and Germany and the United States will take our place in the world's workshop. This "difficulty" of Individualism can be met, indeed, like the rest, only by the application of what are essentially Socialist principles.

Argument and Class Bias.

These "difficulties" will appeal more strongly to some persons than to others. The evils of inequality of wealth will come home more forcibly to the three millions of the submerged tenth in want of the bare necessities of life than they will to the small class provided with every luxury at the cost of the rest. The ethical objection to any diminution in the incomes of those who own our land will vary in strength according, in the main, to our economic or political prepossessions. The indiscriminate multiplication of the unfit, like the drunkenness of the masses, will appear as a cause or an effect of social inequality according to our actual information about the poor, and our disposition towards them. The luxury of the rich may strike us as a sign either of national wealth or of national maladjustment of resources to needs. The autocratic administration of industry will appear either as the beneficent direction of the appropriate captains of industry, or as the tyranny of a proprietary class over those who have no alternative but to become its wage-slaves. The struggle of the slaves among themselves, of the proprietors among themselves, and of each class with the other, may be to us "the beneficent private war which makes one man strive to climb on the shoulders of another, and remain there;"* or it may loom to us, out of the blood and tears and misery of the strife, as a horrible remnant of the barbarism from which man has half risen since

"We dined, as a rule, on each other :
What matter ? the toughest survived."

That survival from an obsolescent form or the struggle for existence may seem the best guarantee for the continuance of the community and the race; or it may, on the other hand, appear a suicidal internecine conflict, as fatal as that between the belly and the members. All through the tale two views are possible, and we shall take the one or the other according to our knowledge and temperament.

* Sir Henry Maine, *Popular Government*, pp. 49, 50.

This power of prepossession and unconscious bias constitutes, indeed, the special difficulty of the Individualists of to-day. Aristotle found it easy to convince himself and his friends that slavery was absolutely necessary to civilization. The Liberty and Property Defence League has the more difficult task of convincing, not the proprietary class, but our modern slaves, who are electors and into whose control the executive power of the community is more and more falling. And in this task the Individualists receive ever less and less help from the chief executive officers of the nation. Those who have forced directly upon their notice the larger aspects of the problem, those who are directly responsible for the collective interests of the community, can now hardly avoid, whether they like it or not, taking the Socialist view. Each Minister of State protests against Socialism in the abstract, but every decision that he gives in his own department leans more and more away from the Individualist side.

Socialism and Liberty.

Some persons may object that this gradual expansion of the collective administration of the nation's life cannot fairly be styled a Socialistic development, and that the name ought to be refused to everything but a complete system of society on a Communist basis. But whatever Socialism may have meant in the past its real significance now is the steady expansion of representative self-government into the industrial sphere. This industrial democracy it is, and not any ingenious Utopia, with which Individualists, if they desire to make any effectual resistance to the substitution of collective for individual will, must attempt to deal. Most political students are, indeed, now prepared to agree with the Socialist that our restrictive laws and municipal Socialism, so far as these have yet gone, do, as a matter of fact, secure a greater well-being and general freedom than that system of complete personal liberty, of which the "sins of legislators" have deprived us. The sacred name of liberty is invoked, by both parties, and the question at issue is merely one of method. As each "difficulty" of the present social order presents itself for solution, the Socialist points to the experience of all advanced industrial countries, and urges that personal freedom can be obtained by the great mass of the people only by their substituting democratic self-government in the industrial world for that personal power which the Industrial Revolution has placed in the hands of the proprietary class. His opponents regard individual liberty as inconsistent with collective control, and accordingly resist any extension of this "higher freedom" of collective life. Their main difficulty is the advance of democracy, ever more and more claiming to extend itself into the field of industry. To all objections, fears, doubts, and difficulties, as to the practicability of doing in the industrial what has already been done in the political world, the democratic answer is "*solvitur ambulando*;" only that is done at any time which is proved to be then and there practicable; only such advance is made as the progress in the sense of public duty permits. But that progress is both our hope

and our real aim : the development of individual character is the Socialist's "odd trick" for the sake of which he seeks to win all others.

Industrial democracy must therefore necessarily be gradual in its development ; and cannot for long ages be absolutely complete. The time may never arrive, even as regards material things, when individual is entirely merged in collective ownership or control, but it is matter of common observation that every attempt to grapple with the "difficulties" of our existing civilization brings us nearer to that goal.

BASIS OF THE FABIAN SOCIETY.

The Fabian Society consists of Socialists.

It therefore aims at the re-organization of Society by the emancipation of Land and Industrial Capital from individual and class ownership, and the vesting of them in the community for the general benefit. In this way only can the natural and acquired advantages of the country be equitably shared by the whole people.

The Society accordingly works for the extinction of private property in Land and of the consequent individual appropriation, in the form of Rent, of the price paid for permission to use the earth, as well as for the advantages of superior soils and sites.

The Society, further, works for the transfer to the community of the administration of such Industrial Capital as can conveniently be managed socially. For, owing to the monopoly of the means of production in the past, industrial inventions and the transformation of surplus income into Capital have mainly enriched the proprietary class, the worker being now dependent on that class for leave to earn a living.

If these measures be carried out, without compensation (though not without such relief to expropriated individuals as may seem fit to the community), Rent and Interest will be added to the reward of labor, the idle class now living on the labor of others will necessarily disappear, and practical equality of opportunity will be maintained by the spontaneous action of economic forces with much less interference with personal liberty than the present system entails.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. The Annual Report with the Rules and a list of publications can be obtained at the Office, 25 Tothill Street, Westminster, London, S.W.

REPORT ON FABIAN POLICY

AND

RESOLUTIONS

PRESENTED BY

THE FABIAN SOCIETY

TO THE

International Socialist Workers and Trade
Union Congress, London, 1896.

PRICE ONE PENNY.

LONDON :

PUBLISHED BY THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.

JULY 1896.

REPORT ON FABIAN POLICY.

I.

The Mission of the Fabians.

THE object of the Fabian Society is to persuade the English people to make their political constitution thoroughly democratic and so to socialize their industries as to make the livelihood of the people entirely independent of private Capitalism.

The Fabian Society endeavors to pursue its Socialist and Democratic objects with complete singleness of aim. For example :—

It has no distinctive opinions on the Marriage Question, Religion, Art, abstract Economics, historic Evolution, Currency, or any other subject than its own special business of practical Democracy and Socialism.

It brings all the pressure and persuasion in its power to bear on existing forces, caring nothing by what name any party calls itself, or what principles, Socialist or other, it professes, but having regard solely to the tendency of its actions, supporting those which make for Socialism and Democracy, and opposing those which are reactionary.

It does not propose that the practical steps towards Social-Democracy should be carried out by itself, or by any other specially organized society or party.

It does not ask the English people to join the Fabian Society.

II.

Fabian Electoral Tactics.

The Fabian Society does not claim to be the people of England, or even the Socialist party, and therefore does not seek direct political representation by putting forward Fabian candidates at elections. But it loses no opportunity of influencing elections and inducing constituencies to select Socialists as their candidates. No person, however, can obtain the support of the Fabian Society, or escape its opposition, by merely repeating a few shibboleths and calling himself a Socialist or Social-Democrat. As there is no

Second Ballot in England, frivolous candidatures give great offence, and discredit the party in whose name they are undertaken, because any third candidate who is not well supported will not only be beaten himself, but may also involve in his defeat the better of the two candidates competing with him. Under such circumstances the Fabian Society throws its weight against the third candidate, whether he calls himself a Socialist or not, in order to secure the victory to the better of the two candidates between whom the contest really lies. But when the third candidate is not only a serious representative of Socialism, but can organize his party well, and is likely to poll sufficient votes to make even his defeat a respectable demonstration of the strength and growth of Socialism in the constituency, the Fabian Society supports him resolutely under all circumstances and against all other parties.

III.

Fabian Toleration.

The Fabian Society, far from holding aloof from other bodies, urges its members to lose no opportunity of joining them and permeating them with Fabian ideas as far as possible. Almost all organizations and movements contain elements making for Socialism, no matter how remote the sympathies and intentions of their founders may be from those of the Socialists. On the other hand, unintentionally reactionary proposals are constantly being brought forward in Socialist bodies. Fabians are therefore encouraged to join all other organizations, Socialist or non-Socialist, in which Fabian work can be done.

IV.

Fabian Constitutionalism.

The Fabian Society is perfectly constitutional in its attitude; and its methods are those usual in political life in England.

The Fabian Society accepts the conditions imposed on it by human nature and by the national character and political circumstances of the English people. It sympathizes with the ordinary citizen's desire for gradual, peaceful changes, as against revolution, conflict with the army and police, and martyrdom. It recognizes the fact that Social-Democracy is not the whole of the working-class program, and that every separate measure towards the socialization of industry will have to compete for precedence with numbers of other reforms. It therefore does not believe that the moment will ever come when the whole of Socialism will be staked on the issue of a single General Election or a single Bill in the House of Commons, as between the proletariat on one side and the proprietariat on the other. Each instalment of Social-Democracy will only be a measure among other measures, and will have to be kept to the front by an energetic Socialist section. The Fabian Society therefore begs those Socialists who are looking forward to a sensational historical crisis, to join some other Society.

V.

Fabian Democracy.

Democracy, as understood by the Fabian Society, means simply the control of the administration by freely elected representatives of the people. The Fabian Society energetically repudiates all conceptions of Democracy as a system by which the technical work of government administration, and the appointment of public officials, shall be carried on by referendum or any other form of direct popular decision. Such arrangements may be practical in a village community, but not in the complicated industrial civilizations which are ripening for Social-Democracy. When the House of Commons is freed from the veto of the House of Lords and thrown open to candidates from all classes by an effective system of Payment of Representatives and a more rational method of election, the British parliamentary system will be, in the opinion of the Fabian Society, a first-rate practical instrument of democratic government.

Democracy, as understood by the Fabian Society, makes no political distinction between men and women.

VI.

Fabian Compromise.

The Fabian Society, having learnt from experience that Socialists cannot have their own way in everything any more than other people, recognizes that in a Democratic community Compromise is a necessary condition of political progress.

VII.

Fabian Socialism.

Socialism, as understood by the Fabian Society, means the organization and conduct of the necessary industries of the country, and the appropriation of all forms of economic rent of land and capital by the nation as a whole, through the most suitable public authorities, parochial, municipal, provincial, or central.

The Socialism advocated by the Fabian Society is State Socialism exclusively. The foreign friends of the Fabian Society must interpret this declaration in view of the fact that since England now possesses an elaborate democratic State machinery, graduated from the Parish Council or Vestry up to the central Parliament, and elected under a franchise which enables the working-class vote to overwhelm all others, the opposition which exists in the Continental monarchies between the State and the people does not hamper English Socialists. For example, the distinction made between State Socialism and Social-Democracy in Germany, where the municipalities and other local bodies are closed against the working classes, has no meaning in England. The difficulty in England is not to secure more political power for the people, but to persuade them to make any sensible use of the power they already have.

VIII.

Fabian Individualism.

The Fabian Society does not suggest that the State should monopolize industry as against private enterprise or individual initiative further than may be necessary to make the livelihood of the people and their access to the sources of production completely independent of both. The freedom of individuals to test the social value of new inventions; to initiate improved methods of production; to anticipate and lead public enterprise in catering for new social wants; to practise all arts, crafts, and professions independently; in short, to complete the social organization by adding the resources of private activity and judgment to those of public routine, is, subject to the above conditions, as highly valued by the Fabian Society as Freedom of Speech, Freedom of the Press, or any other article in the charter of popular liberties.

IX.

Fabian Freedom of Thought.

The Fabian Society strenuously maintains its freedom of thought and speech with regard to the errors of Socialist authors, economists, leaders and parties, no less than to those of its opponents. For instance, it insists on the necessity of maintaining as critical an attitude towards Marx and Lassalle, some of whose views must by this time be discarded as erroneous or obsolete, as these eminent Socialists themselves maintained towards their predecessors, St. Simon and Robert Owen.

X.

Fabian Journalism.

The Fabian Society, in its relations with the Press, makes no such distinction as that indicated by the phrase "the Capitalist Press." In England all political papers without exception are conducted with private capital under the control of the owners of the capital. Some of them profess Socialist opinions, others Conservative opinions, others Liberal and Radical opinions, and so forth. The Socialist papers are in no way more independent of social pressure than the others; and the superiority of a Socialist paper from the Socialist point of view is of exactly the same nature as the superiority of a Conservative paper from the Conservative point of view. The Fabian Society, in securing journalistic expression for its ideas, has no preference, except for the largest circulation.

XI.

Fabians and the Middle Class

In view of the fact that the Socialist movement has been hitherto inspired, instructed, and led by members of the middle class or "bourgeoisie," the Fabian Society, though not at all surprised to

find these middle class leaders attacking with much bitterness the narrow social ideals current in their own class, protests against the absurdity of Socialists denouncing the very class from which Socialism has sprung as specially hostile to it. The Fabian Society has no romantic illusions as to the freedom of the proletariat from these same narrow ideals. Like every other Socialist society, it can only educate the people in Socialism by making them conversant with the conclusions of the most enlightened members of all classes. The Fabian Society, therefore, cannot reasonably use the words "bourgeois" or "middle class" as terms of reproach, more especially as it would thereby condemn a large proportion of its own members.

XII.

Fabian Natural Philosophy.

The Fabian Society endeavors to rouse social compunction by making the public conscious of the evil condition of society under the present system. This it does by the collection and publication of authentic and impartial statistical tracts, compiled, not from the works of Socialists, but from official sources. The first volume of Karl Marx's "Das Kapital," which contains an immense mass of carefully verified facts concerning modern capitalistic civilization, and practically nothing about Socialism, is probably the most successful propagandist work ever published. The Fabian Society, in its endeavors to continue the work of Marx in this direction, has found that the guesses made by Socialists at the condition of the people almost invariably flatter the existing system instead of, as might be suspected, exaggerating its evils. The Fabian Society therefore concludes that in the natural philosophy of Socialism, light is a more important factor than heat.

XIII.

Fabian Repudiations.

The Fabian Society discards such phrases as "the abolition of the wage system," which can only mislead the public as to the aims of Socialism. Socialism does not involve the abolition of wages, but the establishment of standard allowances for the maintenance of all workers by the community in its own service, as an alternative to wages fixed by the competition of destitute men and women for private employment, as well as to commercial profits, commissions, and all other speculative and competitive forms of remuneration. In short, the Fabian Society, far from desiring to abolish wages, wishes to secure them for everybody.

The Fabian Society resolutely opposes all pretensions to hamper the socialization of industry with equal wages, equal hours of labor, equal official status, or equal authority for everyone. Such conditions are not only impracticable, but incompatible with the equality of subordination to the common interest which is fundamental in modern Socialism.

The Fabian Society steadfastly discountenances all schemes for securing to any person, or any group of persons, "the entire product of their labor." It recognizes that wealth is social in its origin and must be social in its distribution, since the evolution of industry has made it impossible to distinguish the particular contribution that each person makes to the common product, or to ascertain its value.

The Fabian Society desires to offer to all projectors and founders of Utopian communities in South America, Africa, and other remote localities, its apologies for its impatience of such adventures. To such projectors, and all patrons of schemes for starting similar settlements and workshops at home, the Society announces emphatically that it does not believe in the establishment of Socialism by private enterprise.

XIV.

Finally.

The Fabian Society does not put Socialism forward as a panacea for the ills of human society, but only for those produced by defective organization of industry and by a radically bad distribution of wealth.

RESOLUTIONS.

I.

The Eight Hours Day.

The Congress declares its adhesion to the resolution regarding the Eight Hours Day passed at the Zurich Congress, and puts forward the following proposals as the immediate steps to be taken towards the introduction of that reform and as the irreducible minimum of the demands of Labor :—

1. That the hours of labor for all Government and Municipal employees shall be at most eight per day or forty-eight per week ;
2. That in the mining, railway, and baking industries, and in all dangerous trades, the working-day shall be limited to eight hours ;
3. That in all other industries the Minister responsible for Labor shall be bound, on the demand of a Labor organization, to institute an enquiry into the hours of labor in any given trade, and to issue, subject to formal revision by the Legislature, such regulations as may, to his expert advisers, seem expedient ;

4. That, subject to cases of unforeseen emergency, for which an indemnity must be obtained from the Minister responsible for Labor, overtime above the hours specified in the foregoing clauses shall be prohibited.

II.

Child Labor.

Considering—

That the employment of children in industry at too early an age is not only injurious to their health, but also causes physical deterioration in following generations; that their competition is used to beat down the wages of adult workers; and that the only possible excuse for the employment of children, namely, the training of them to be efficient workers, no longer exists owing to the breakdown of the apprenticeship system through the development of extreme specialization in manufacturing processes,

This Congress demands—

1. That the minimum age at which children can be employed as half-timers shall be raised at once to 14 years, and in *two* years time to 16.
2. That the minimum age for full-timers shall be similarly fixed at 16 years, and in two years at 18.
3. That in mines, glass-works, iron-works, and all dangerous trades, the minimum age of employment shall be 16.
4. That the State shall provide an efficient system of technical education, free and compulsory, with maintenance, for children between the time of their leaving the elementary school and the age at which they can be fully employed as workers.

III.

Factory Legislation.

Considering—

That it is one of the chief duties of the State to secure the health and safety of the workers, but that this duty cannot be effectually fulfilled unless it is undertaken in a scientific manner,

The Congress demands—

1. That every Government shall institute committees of experts (including machine workers) to study the best means of preventing accidents from the different kinds of machinery;
2. That every Government shall also establish laboratories for the investigation of the safest processes of manufacture;
3. That, supported by the opinion of his expert advisers, the Minister responsible for Labor shall have power to issue departmental regulations in such matters as the fencing of machinery, precautions to be taken in manufacture, etc., and also, subject to revision of his orders by the Legislature, to prohibit processes as dangerous;

4. That the white-lead industry and the making of matches from yellow phosphorus—dangerous occupations for which safe and effectual substitutes are acknowledged to exist—shall be at once prohibited.

IV.

Women's Work.

That this Congress approves the principle of equal pay for equal work; and of equal opportunities for educational and technical training for men and women; and strongly urges, for the benefit of both sexes, the immediate practical application of this principle.

V.

Government Workshops.

This Congress, recognizing that even under the present order of society the manufacture by the Government of all the commodities which it requires to perform the functions entrusted to it by the nation can be made the means of setting a fair standard of employment and of putting down sweating, but that at the same time it can be used simply as tax-saving machinery and a weapon of political servitude, urges the electors to press upon their respective Governments to do all their own industrial work themselves, without the intervention of a private contractor, on the following conditions:—

1. That the working-day shall be limited to eight hours;
2. That the wages paid shall be at least equal to those paid by the best private employers;
3. That a sufficient pension shall be paid to employees when incapacitated by age or accident;
4. That a week's holiday per year on full pay shall be secured to each worker;
5. That no worker shall be hindered by any departmental regulations in the exercise of his ordinary rights as a private citizen.

VI.

Nationalization and Municipalization of Industry.

In view of the importance of losing no opportunity of transferring industrial capital from private to public control, and securing to as many wage-workers as possible the comparative independence and permanence of employment enjoyed by public servants, especially in the more democratic countries, this Congress recommends all workers to agitate and vote in favor of:

1. The immediate nationalization of all mines, railways, canals, telegraphs, telephones, and other national monopolies;

2. The immediate municipalization of the supply of water, gas, electric light ; of docks, markets, tramways, omnibus services, and pawnbroking ; lake and river steamboat services ; and of all other local monopolies ;
3. The immediate undertaking by public authorities of : (a) the manufacture and retailing of tobacco and bread ; of the supply of coal, milk, and other universal necessities ; and of the building of dwellings for the workers ; (b) the manufacture and retailing of alcoholic drinks.

VII.

The Unemployed.

The Congress declares :

That the existence of a class of unemployed willing but unable to find work is a necessary result of the present industrial system, in which every improvement in machinery throws fresh masses of men out of work, and the competition of capitalists for the market produces recurring commercial crises ;

That, consequently, unemployment can only be abolished with the complete abolition of the competitive system, and can only be limited in proportion as order and regulation are introduced into the present competitive confusion ;

That while this process of evolution towards the co-operative state is proceeding, the following measures are urgently demanded to relieve the pressure on the industrial market :

The Eight Hours Day ;

The Prohibition of Child-Labor under sixteen ;

The Manufacture by the Government and Municipality of all commodities required by them ;

The extension of Municipal Activity to the complete supply of all common services and the provision of healthy dwellings for the workers ;

The undertaking of useful Public Works in special cases.

VIII.

War and Foreign Policy.

That this Congress desires to call attention to the following facts concerning the great armaments maintained by modern capitalistic States :

- 1 That these armies act as a standing menace, not to neighboring States, but to the working populations of their own countries. A study of the strategical disposition of many of the great railway stations and barracks of the Continent will prove that the most important function of the modern army is to suppress the resistance of Labor to Capital in the war of classes.

2. That these huge armaments, far from making the nations powerful in international affairs, actually paralyze them through the intense fear and mistrust they engender. The Congress, repudiating the bravado of the capitalist press, emphatically declares that the nations it represents find it impossible to act in international affairs because of their jealousy of one another's intentions and their fear of one another's threats. The Congress points to recent events in Europe and the South of Africa as proving that the smallest States can successfully defy the interference of the great European military powers by adroitly playing off the one against the other.
3. That since the resistance of the capitalist classes to any interference by the State in commercially profitable enterprises makes it impossible to use national armaments to enforce order and public responsibility in the colonization and settlement of new countries, such operations are now left to filibusters acting as the agents of Chartered Companies. The rapacity of these companies, the aggressions of the irresponsible adventurers who lead their armed forces, and the competition of rival companies, produce endless disputes, in which each company calls on its mother country to support it by arms in the name of patriotism, the chairman being represented in the capitalist press as an imperial statesman, and its filibusters as national heroes. Thus the great European States, whilst they are powerless to undertake the work of colonization themselves, are expected to hold themselves continually in readiness to go to war, not only with barbarous races, but with one another, in defence of enterprises over which they have no control. The Congress desires to warn the workers of Europe against these appeals to national pride and love of military glory, and to repeat that the tendency of the capitalist system is to make the army a cat paw for the speculator instead of an instrument of national greatness and honor.
4. That the only possible guarantee for the peace of the world lies in the consolidation of the interests of the most advanced States on a Social-Democratic basis. War exists at present mainly because huge profits can be made out of it by sections of the community. If this were made impossible by the socialization of industry in England, France, Germany and the United States of America, these four nations would not only cease to threaten one another, but would combine to impose peace on nations less advanced in social organization. Therefore, the Congress, whilst sympathizing heartily with the objects of the Peace and Arbitration Societies, urges them to bear constantly in mind that until the antagonism of social interests which produces conflicts between Capital and Labor at home is dissolved, international solidarity must remain impossible.

IX.

Prisons.

That this Congress earnestly presses upon Humanitarians and advocates of reform of the criminal law, that the greatest obstacle to the attainment of their ends is the dependence of the capitalist system on a low standard of life and comfort among the mass of wage-workers. All attempts to make prison labor productive are regarded by private capitalists as attempts to compete with them and reduce their profits; and all reforms that aim at making prison life less cruel and more wholesome are resented in all classes on the ground that criminals should not be treated better than honest men. The Congress therefore urges the necessity of improving the conditions of the masses outside the prisons as the surest means of ameliorating the lot of those who are inside them.

X.

Women's Political Rights.

That this Congress calls upon all Trade Unionists and Socialists to strive energetically to secure to women complete equality with men in all political rights and duties.

XI.

The Referendum.

That this Congress warns associations of the working classes throughout the world to scrutinize with great care all proposals for transferring direct legislative and administrative power, including the appointment of public officials, from representative bodies to the mass of the electors. The people can only judge political measures by their effect when they have come into operation: they cannot plan measures themselves, or foresee what their effect will be, or give precise instructions to their representatives; nor can any honest representative tell, until he has heard a measure thoroughly discussed by representatives of all other sections of the working class, what form the measure should take so as to keep the interests of his constituents in due subordination to those of the community. It is to be considered, further, that intelligent reformers, especially workmen who have grasped the principles of Socialism, are always in a minority: they may address themselves with success to the sympathies of the masses and gain their confidence; but the dry detail of the legislative and administrative steps by which they move towards their goal can never be made interesting or intelligible to the ordinary voter. For these reasons the Referendum, in theory the most democratic of popular institutions, is in practice the most reactionary, and is actually being strenuously advocated in England by noted leaders of anti-Socialist opinion with the openly declared

intention of using it to stop all further progress towards Social Democracy. Again, the election of public officials by the general vote makes the official not only independent of the representatives of the people, but makes him practically irremovable, and therefore autocratic, as long as he does not openly scandalize public opinion by expressing unconventional views. The ordinary man, unable to judge whether important public functions are efficiently discharged or not, and reluctant to turn a man out of his employment without some very grave reason for doing so, invariably votes for the retention of an office by its present holder. This has been abundantly proved by the experience of English Trade Unions, in which the bureau, elected by the votes of all the members, is all-powerful, the sole exception being those unions in the cotton industry in which the officials are directly controlled by a representative body and not by the mass of members. The Congress, therefore, without attempting to lay down any general rule in the matter, most earnestly urges its supporters and sympathisers in all countries to study democratic institutions in the light of practice and not of theory alone; to take careful note of the fact that the Referendum, the Initiative, the election of officials by universal suffrage, and the reduction of representative bodies to mere meetings of delegates recording the foregone conclusions of their constituents, usually produce results exactly the opposite of those expected from them by Democrats, and to oppose them strenuously in all cases where their effect would be to place the organized, intelligent and class-conscious Socialist minority at the mercy of the unorganized and apathetic mass of routine toilers, imposed upon by the prestige of the aristocratic, plutocratic and clerical forces of reaction.

XII.

Minimum Wage.

That this Congress urges upon public consideration the evils produced by allowing the standard of living among the mass of the people to be fixed by unrestrained commercial competition. Under existing circumstances, the market price of unskilled labor is so low that in all modern States competition wages are popularly called "starvation wages." The Congress desires to point out that a healthy and vigorous national life can only be secured at present by fixing in all industries and in all districts a minimum wage sufficient to maintain laborers and their families in reasonable health and efficiency. The Congress points out that resolute agitation on the part of all electors can already secure a minimum living wage to all direct employees of the central State, the municipalities, and other local authorities; and that these bodies can also protect those whom they employ indirectly by the insertion of effective standard wage clauses in all contracts for public work and in all leases and concessions made to tramway companies, railway companies, dock companies, and other recipients of special powers and privileges. The Congress urges public authorities to endeavor, as far as pos-

sible, to organize and conduct public services and industries directly, without resorting to private contractors and companies. In the case of private employees, the Congress recommends Trade Unions and federations of Trade Unions in every industrial district to hold fast to the principle of the minimum living wage, and to resolutely limit by it all proposals—whether by sliding scale or otherwise—to make the remuneration of labor depend on the profits of the trade. In cases where the working classes themselves organize and employ labor, as in Co-operative Societies, the Congress feels justified in demanding the establishment of a minimum living wage as a pledge of the sincerity of the recognition by these societies of community of interest between the shareholders and their employees.

BASIS OF THE FABIAN SOCIETY.

The Fabian Society consists of Socialists.

It therefore aims at the re-organization of Society by the emancipation of Land and Industrial Capital from individual and class ownership, and the vesting of them in the community for the general benefit. In this way only can the natural and acquired advantages of the country be equitably shared by the whole people.

The Society accordingly works for the extinction of private property in Land and of the consequent individual appropriation, in the form of Rent, of the price paid for permission to use the earth, as well as for the advantages of superior soils and sites.

The Society, further, works for the transfer to the community of the administration of such Industrial Capital as can conveniently be managed socially. For, owing to the monopoly of the means of production in the past, industrial inventions and the transformation of surplus income into Capital have mainly enriched the proprietary class, the worker being now dependent on that class for leave to earn a living.

If these measures be carried out, without compensation (though not without such relief to expropriated individuals as may seem fit to the community), Rent and Interest will be added to the reward of labor, the idle class now living on the labor of others will necessarily disappear, and practical equality of opportunity will be maintained by the spontaneous action of economic forces with much less interference with personal liberty than the present system entails.

For the attainment of these ends the Fabian Society looks to the spread of Socialist opinions, and the social and political changes consequent thereon. It seeks to promote these by the general dissemination of knowledge as to the relation between the individual and Society in its economic, ethical and political aspects.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

FABIAN ESSAYS IN SOCIALISM. Paper 6d.; cloth 1/6; post. 2½d. and 4d.

THE LONDON Tenant's Sanitary Catechism.

THE attention of householders and lodgers is directed to the powers given to local authorities and to the Local Government Board by the Acts mentioned below. Occupiers finding that their houses are not in the sanitary condition prescribed by those Acts, should fill in the answers to the questions printed below in the spaces provided for them and should then send this paper, either signed by themselves or NOT, to the Sanitary Inspector for the district, who will be obliged when he receives it to enquire into the matter.

Any person employed in an insanitary workshop may use this form to describe it, and in such cases the form should be sent either to the Sanitary Inspector of the district or to the Factory Inspector, Home Office, Whitehall, S.W., who will cause enquiry to be made.

QUESTIONS.

ANSWERS.

1. Name of borough and ward or parish.

2. Name of street and number of house.

3. Name of occupier or occupiers.

4. Name and address of the reputed owner.

5. Has the house a water closet for the sole use of its inmates?

6. If not, how many (a) persons, (b) houses use the same closet?

7. If a water closet, is it properly flushed with water from a cistern separated from that used for drinking water?

8. Is any of the rooms fitted with a proper sink? Is the sink in sound condition and trapped?

9. Is there a properly constructed dustbin or sanitary pail for the sole use of the inmates? Is it regularly emptied?

10. Is the water supply abundant? Is it constant or intermittent? Are the cisterns regularly cleaned and in an accessible place for inspection?

QUESTIONS.

ANSWERS.

11. Are the taps conveniently placed? If a tenement house, is there one on each floor?

12. If the house is a tenement house, is there (a) suitable cooking accommodation for each family, (b) a suitable pantry or other storage accommodation for food on each floor?

[N.B.—(a) can only be demanded if the house was built or first used as a tenement house after August, 1908, and (b) if it was built or first used as a tenement house after August, 1909. London County Council (General Powers) Acts, 1908 and 1909.]

13. Are the ceilings, walls, and floors throughout in a proper state of repair?

14. Is the roof sound and watertight?

15. Are there bugs or other vermin in any part of the house?

16. Is any part of the house damp?

17. Is the back yard properly drained and paved?

18. If underground rooms are used for sleeping in, (a) what height are they from floor to ceiling, (b) what distance are they below the surface of the street, and (c) how are they lighted, ventilated and drained?

19. How many rooms are there in the house?

20. Is the house or are any of the rooms so overcrowded as to be dangerous or injurious to the health of the inmates?

21. Is *any* part of the house in such a condition as to be a nuisance or to be dangerous or injurious to the health of its inmates?

22. What is the space, back and front, between the house and the nearest buildings?

23. Has the house through ventilation, or is it a back to back house?

24. Are there any works near which cause bad smells or noises at night? Are there any factory chimneys which persistently pour smoke upon the dwelling?

QUESTIONS.

ANSWERS.

25. What weekly rent do you pay ?
26. Was the house in proper condition when you became the tenant ?

NOTES.

The following notes will be found useful.

PUBLIC HEALTH (LONDON) ACT, 1891.

Section 2 defines nuisances which may be dealt with summarily. These include "premises in such a state as to be a nuisance or injurious or dangerous to health;" pools, ditches, gutters, watercourses, cisterns, water closets, privies, urinals, cesspools, drains, dungpits, or ashpits so foul as to be a nuisance or injurious, etc.; any accumulation or deposit similarly a nuisance or injurious, etc.; and "any house or part of a house so overcrowded as to be injurious or dangerous to the health of the inmates, whether or not members of the same family." Overcrowding is defined in the Model Byelaws as being more than one adult to three hundred cubic feet of air space, two children being equal to one adult.

Section 3 directs the local authority on ascertaining the existence of any nuisance to take immediate steps to mitigate it, and the procedure under this Act has since been simplified by the Housing and Town Planning, etc., Act, 1909. See below.

Section 7 permits the closing for a given period, to be decided on in each case, of any house for persistent overcrowding, *i.e.*, two convictions within three months.

Section 16 directs the local authority to make byelaws to prevent nuisances arising (1) from offensive matter flowing from any manufactory, slaughter yard, etc.; (2) from keeping animals in unsuitable places; (3) from the yards of dwelling houses or open spaces connected therewith not being properly paved.

Sections 21 and 23 deal with bad smells, noises at night, and black smoke coming from factories and works. Where such nuisances can be proved, they must be abated, but it must be noted that the persistent pouring of black smoke is difficult to prove.

Section 30 requires the local authority to make provision for the due and regular removal of house refuse, and in default a fine not exceeding twenty pounds may be imposed. No one employed in this work may accept fees or gratuities from the occupier of any house or his servant.

Section 37 deals with the provision of ashpits and water closets, etc. Each house newly built or rebuilt must be provided with a proper and sufficient water closet, and in any house already built, the local authority may require such provision to be made. But where a water closet before the passing of this Act had been used by the occupants of two or more houses, it may, if the local authority thinks it sufficient, continue to be so used, and the local authority need not require a water closet to be provided for each house.

(N.B. But all local authorities should so require.)

Sections 39 and 50 require local authorities to make byelaws as to the proper supply of water for water closets and for securing cleanliness and freedom from pollution of cisterns, tanks, etc., used for storing of water used or likely to be used for drinking or domestic purposes or for manufacturing drink.

Section 94 requires local authorities to make and enforce such byelaws as are requisite for dealing with houses let in lodgings or occupied by members of more than one family (1) for registering and inspecting them; (2) for fixing the number of per-

sons who may occupy them and the separation of the sexes; (3) for enforcing drainage and promoting cleanliness and ventilation; (4) for cleansing and lime-washing at stated times; and (5) for taking precautions in case of infectious disease.

This does not apply to common lodging houses, which are dealt with in separate Acts.

THE HOUSING OF THE WORKING CLASSES ACT, 1890.

Section 31 provides that if four or more householders in or near a street make written complaint of any house or houses in that street, the Medical Officer of Health shall inspect and report to the local authority the condition of the property in question.

Section 38 gives power to the local authority to order the removal of any building which though not in itself unfit for human habitation causes an obstruction to other buildings by stopping ventilation, impeding light or preventing necessary improvements to such other buildings from being carried out.

LONDON COUNTY COUNCIL (GENERAL POWERS) ACT, 1907.

Section 78 requires that a supply of water shall be provided on each storey of a tenement house unless it can be shown that such a supply is not reasonably necessary.

THE HOUSING AND TOWN PLANNING, ETC., ACT, 1909.

Under the provisions of this Act, sections 14, 15, 16, 17, and 18, extended powers are given to the local authorities for keeping houses in repair and closing or demolishing insanitary dwellings. The duty of making from time to time a house to house inspection is laid upon the local authority. The local authority having served an order upon any landlord for necessary repairs, may in the event of their not being carried out within the time specified, do the work itself and recover the cost from the landlord. Further the landlord of a house in London rented at £40 a year or under is bound to make it "in all respects reasonably fit for human habitation" before letting it and afterwards to keep it so, and damages may be recovered against him if he neglects to do so and the tenant suffers thereby. The local authority also may put it into proper condition and charge the landlord with the cost. The procedure with regard to closing orders and orders for demolition has been altered so that the local authority may now make such orders instead of a magistrate, and the owner can appeal against them only to the Local Government Board. Further, the local authority may pay to any occupier of property against which a closing order is made a reasonable sum for the cost of removal, and this sum may be recovered by the local authority from the owner.

By section 10 provision is made whereby if the local authority refuse to take steps to deal with any insanitary property, any four inhabitant householders in the district may appeal to the Local Government Board, who may order a public enquiry to be held and as a result of such enquiry may make an order directing the local authority to take the necessary steps.

Section 17 (7) provides that an underground room used as a sleeping place shall be deemed unfit for human habitation if it is more than three feet below the surface of the street and not on the average seven feet from floor to ceiling, and if further it does not comply with the regulations made by the local authority for proper ventilation, drainage, etc. The local authority must make such regulations when required to do so by the Local Government Board, or in default the Local Government Board will make them. Such regulations must be made by the local authority with the consent of the Local Government Board when required by the Local Government Board to do so. If the local authority does not make the regulations or if the Local Government Board does not approve them, the Local Government Board may make them itself, and they will have the same force as though made by the local authority. Underground rooms not complying with these regulations are not necessarily closed for other purposes than use as sleeping places.

Section 43 prohibits the building at any time after the passing of this Act of back to back houses.

Any Act of Parliament may be obtained for a few pence from P. S. King & Son, Great Smith Street, Westminster, S.W.

THE MORAL ASPECTS OF SOCIALISM.*

Socialism and Character.

MODERN SOCIALISM, or Collectivism, is often regarded as a typical expression of the neglect, or even the denial, of the principle that in social reform character is "the condition of conditions." At first sight, it seems true that character has not been put in the foreground of Socialist discussion: its emphasis appears to be laid almost exclusively on machinery, on a reconstruction of the material conditions and organization of life. But machinery is a means to an end, as much to a Socialist as to anyone else; and the end, at any rate as conceived by the Socialist, is the development of human power and capacity of life. The quarrel with Socialists cannot be, then, that they mistake the means for the end, but either that they take a low or narrow view of human nature, or that the means they suggest will lower rather than raise the scale of human life.

The Evolution in Modern Socialism.

It is important that we should realize the nature of the development which has been at work in the conception of Socialism. If Socialism repeats itself, it repeats itself with a difference. If we fairly compare the Socialism of the earlier with that of the latter part of the century, we shall find that, however much they have in common, there is a sense in which the conception of Socialism is entirely modern. Socialism would not be the vital thing it is, if it remained unaffected by the development of social and industrial experience, and the general progress of scientific thought. The context is different, and even when the language is the same, the meaning is changed.† The claim of modern Socialism to be "scientific" may be just or not, but it means by "scientific" such an economy as shall be on a line with the modern scientific treatment and conception of life. Its dominating idea is that of conscious selection in social life, or of the expression of practical economics in terms of quality of life. From the point of view of its alleged indifference to character, the aims of modern Socialism may be described as an endeavor to readjust the machinery of industry in such a way that it can at once depend upon and issue in a higher

* Reprinted (by permission) from the *International Journal of Ethics*, April, 1896, with some omissions and additions.

† To give one example. State Socialism means one thing to a German, another to an Englishman; and one thing to an Englishman of Adam Smith's time, and another to an Englishman of our own time: the State, in the latter context, means the community democratically organized for collective purposes, whether parochially, locally, or nationally.

kind of character and social type than is encouraged by the conditions of ordinary competitive enterprise. If it does, in a sense, want to make things easier, it is only for the worker, and not for the idler; and the problem with which it is concerned is not primarily a more or less of enjoyment, but a more or less of opportunity for development of character and individuality. Its criterion of economic machinery is simply—does it or does it not make for a greater amount and quality of life and character?

The older Socialism rested upon such ideas as "the right to live," "the right to work," "payment according to needs," the denial of "the rent of ability," "expropriation without compensation," "minimizing" or "materializing" of wants—all ideas of retrogressive rather than of progressive "selection." But it would not be too much to say that all these ideas are either silently ignored or expressly repudiated by modern Socialism. The "ideology" of the older Socialists has given way to a deliberately, and in some ways rigidly, scientific treatment of life. Modern Socialism recognizes the laws of social growth and development in setting itself against catastrophic impossibilism and the manufacture of mechanical Utopias; it recognizes the moral continuity of society in its consideration for vested interests; it does not base industrial organization on "the right to work" so much as on the right of the worker, not on "payment according to needs" so much as "payment according to services"; it recognizes the remuneration of ability, provided that the ability does not merely represent a monopoly of privileged and non-competitive advantage; it is aware of the utility of capital, without making the individualist's confusion between the employment of capital and the ownership of it, between the productive and proprietary classes; it is not concerned about the inequality of property, except so far as it conflicts with sound national economy; it does not desire so much to minimize as to rationalize wants, and attaches the utmost importance to the qualitative development of consumption; and, finally, not to enumerate more distinctly economic developments, it recognizes "the abiding necessity for contest, competition, and selection," as means of development, when it presses for such an organization of industry as shall make selection according to ability and character the determining factor in the remuneration of labor.

Socialism and Competition.

So far from attempting to eliminate "competition" from life, it endeavors to raise its plane, to make it a competition of character and positive social quality. The competition which takes the form not of doing one's own work as well as possible, but of preventing any one else from doing the same work—the form of competition, that is, in which the gain of one man is the loss of another—is of no social value. The only competition that can advance individual or social life is simply a corollary of co-operation; it implies the recognition of a common good and a common interest which gives to our "individual" work its meaning, its quality, and its value; and the

further recognition that a competitor is also a co-operator. If a seeker after truth regards another seeker merely as a competitor, it is a sure sign that it is not truth he cares for : and we are only too familiar with the consequences of a system of industry which does not provide for the disinterestedness of all genuine production. The competition to get as much as possible for one's self is incompatible with the competition to get a thing done as well as possible. It is this kind of socially selective rivalry that Socialism is concerned to maintain ; and the two kinds of competition* belong, as Plato might have said, to two distinct " arts."

Socialism Affirms a Standard.

This is the meaning, for instance, of a " standard " as opposed to a " market " wage. The Collectivist policy of the " Union " wage for skilled, and a minimum wage for unskilled labor, is a deliberate preference of a form of competition which promotes efficiency over a form of competition which aims at (apparent) cheapness. Which is the most productive method of selection? The Individualist policy results in the degradation of labor and the increase of burdens upon the State ; the Socialist policy, so far from favoring the weak, favors the strong, if weakness and strength are interpreted as relevant to social value ; it is a process of conscious social selection by which the industrial residuum is naturally sifted and made manageable for some kind of restorative, disciplinary, or, it may be, " surgical " treatment. The organization of dock laborers and the extension of factory inspection to sweated industries follow the same lines. Any such form of collective interference as the freeing of education, or the weakening of protected and non-competitive privilege, is in favor of the competition which is not simply a struggle for (unqualified) individual existence, but for existence in a society which rests upon the distribution of " rights " according to character and capacity. In this way it not only favors the growth of the fittest within the group, but also of the fittest group in the world-competition of societies. The whole point of Collectivism is the recognition by society of its interest as a society in a certain type of character and quality of existence. " Can there be anything better for the interests of a State," as Plato puts it, " than that its men and women should be as good as possible? " It is just this social reference that explains the demand which Socialists make upon the organization of industry. Their whole quarrel with private competitive enterprise is that it does not give a qualitative form to the struggle for existence, and does not—or rather cannot—concern itself with the maintenance of a standard of life.

Individualism Denies a Standard.

To speak, therefore, of " the principle of Collectivism " as " lying at the root of a compulsory poor rate " (*Charity Organ. Rev.*), reveals an astonishing incapacity for grasping the distinction between the organization of industry (upon selective lines) and the distribution

* Cf. Plato's " Republic," Bk. I., 347-8 : also, Morris and Ruskin, *passim*.

of relief—a *rôle* which Socialists would contend the individualistic system and method of industry has forced upon "the State." The Poor Law system, so far from being a concession to Socialism, is a device of Individualism, which, indeed, could not "work," unless its logical consequences were intercepted by the workhouse and the infirmary. The Poor Law ministers to a system which, in the judgment of Socialists, makes for deterioration—a system which lends itself with fatal facility to partial and discontinuous employment, starvation wages, cheap and nasty production, wasteful, useless, and characterless competition. Collectivism is nothing if not constructive, and constructive on lines of social selection; the Poor Law as it now exists serves the purpose of a waste-receiver of "private enterprise." Collectivism would not, indeed, dispense with the necessity of a poor law; so far, however, as it provided for the able-bodied idler, the workhouse would be simply a branch of the criminal department of the State.* It is no doubt true that this kind of selection is forcing itself upon the system of private commercial enterprise in the interests of economic production, and Professor Loria has based upon this fact his forecast of the gradual evolution of capitalistic industry into some form of associated labor. But "the economy" of high wages, of regular and organized labor, and of genuine production, is discounted by the "active competition" of low wages, casual labor, cheap and adulterated product. And we find, in fact, that the competition of "quality" is only made possible by the cessation of "the competition of the market."

Monopoly versus Competition.

This is the significance of modern Combinations, conceived not as a temporary speculation, but as a permanent organization of a particular industry, based upon the extinction of wasteful rivalry between competitive firms. Whatever may be the abuse of the Combination, it is clearly a higher type of industrial organization, and its abuse is the occasion of Collectivism. It certainly makes a standard of work and a standard of industrial conditions possible; and also it renders the particular industry much more amenable to public opinion and, if need be, public control. And the interest of the modern Combination is that it is not an artificial creation, but a normal development of modern business: it represents a monopoly not of privilege, but of efficiency. It has become, in fact, no longer a question between Competition and Collectivism, but between private and public monopoly, between monopolies controlled by private capitalists and monopolies controlled by the community.†

* Collectivism would provide for the "deserving" and incapable, partly by providing against them, partly by public and humane institutions, partly by the more effective use to which weakness can be put under a better organization of industry; while pensions in old age would be the logical complement of honorable public service.

† This is, doubtless, a disputable generalization, but it accords with the judgment of American economists. Cf. also Baker's "Monopoly and the People," or Von Halle's "Trusts in the United States."

Monopolies of local service, again, are still higher in the industrial scale, so far as they represent the organization of production by the consumers (that is, on the basis of rational and persistent wants), and are under direct public control. And the policy of "practical Collectivism" lies in exacting from such monopolies the full measure of their capacity, and making them object-lessons in co-operative industry.

Monopoly as a Result of Selection.

It is, after all, only by selection that the collective organization of industry can itself prevail, and this is an argument, if any were needed, against any catastrophic closure of the present system. Hence the significance of the demand that government and public bodies should proceed upon a more scientific method than private competitive enterprise "can well afford"—in the direction of better organization of employment, standard wages for standard work, shorter hours, and other model conditions of industry. In Glasgow, at the present moment, there is actually a competition between municipal tramways and private means of transit; and the whole (if short) history of the municipalization of tramways is full of interest and instruction. Municipal management is a higher type of industry, and represents a competition of quality. It might be objected that this argument points to a mixed system of public and private industry, and does not meet the difficulty that a monopoly once established is liable to deterioration. It does point to the means by which public will supersede private administration of certain industries: that is, by competition and proved superiority of type. But it also assumes that the inferior type must give way. Still, the standard remains; it has been to a certain extent set, and to a greater extent recognized and approved, by the community. It could only fall back with a falling back in the community itself, that is, in its standard of satisfaction, material and moral. The higher type at once makes and depends upon its "environment." It may, indeed, have become an object of local pride and civic self-consciousness; a competition may be set up between one municipality and another, and that again would be a competition of quality. Readers of "Unto This Last" will remember a suggestion of the same kind—not the least fruitful idea of the economist who has best understood the real significance of the pre-established harmony between ethics and economics. In the same way it may be said that the real evil of the "drink traffic" is that it is a private, instead of a public, enterprise.

Collectivism will, in fact, proceed by selective experiments of the kind I have indicated, granting the moral and intellectual conditions required by a higher type of administration; and where it does not take the form of social ownership, the principle may be just as effective in the form of social control—control, that is, in the direction of a higher type of industrial character. Mining, railway, and factory legislation is, from this point of view, simply the application of "standard" ideas to competitive industry.

Socialism and its Critics.

If, then, this general account of the drift of Collectivism and of its real inwardness be at all true, what becomes of the polemic against Collectivist ideals that underlies the criticism of eminent social philosophers, and of the false antithesis that is so often set up between "moral" and "economic" Socialism. All the tendencies they attack, Collectivists attack; but while "moral" Socialists are content with ascribing them generally to (abstract) moral and intellectual causes, Collectivists, rightly or wrongly, find that they are moral and intellectual causes which are logically connected with the whole principle and practice of individualistic or private competitive industry, and refuse to believe that some undefined miracle of moral agency is better than any intelligible causation. I propose to deal in detail with this kind of objection to Collectivism, mainly with a view to exhibiting in a clearer light the logical idea and consequences of that position. For I will readily admit that this task is necessary, in view of the language that has been, and to a certain extent still is, used by responsible Socialists. I admit that there is some excuse for the perversion, or rather the construction, of Collectivist philosophy on which the "moral" case against Socialism is supposed to rest. For in some cases the teaching is ambiguous, in others it is evasive, and in certain cases it is demonstrably illogical. The philosophy of Collectivism is still in the making, and reasonable Collectivists themselves are perfectly aware of the extent to which their social doctrine has still to be thought out. But if we can once disengage the root idea, we can, at any rate, say what are logical consequences and what are not; and I hope to show that neither "free meals," nor "relief works," nor "pensions without services," nor "the abolition of private property" are logical deductions from the Collectivist principle; they are, in fact, the denial of it, and could not be part of a strictly Socialist economy.

The Idea of Collectivism.

What, then, is the idea of Modern Socialism, or Collectivism? I take it, Socialism implies, first and foremost, the improvement of society by society. We may be told that this is going on every day; yes, but not with any clear consciousness of what it is about, or of an ideal. Moreover, empirical social reform does not go beyond improvements within the existing system, or consider the effects of that system as a whole. As a rule, it means the modification of the system by an idea which does not belong to it, with the result that it is either ineffective or that it hampers the working of the system itself. When a prominent statesman can say that "We are all socialists now," he has reduced the idea of socializing individualistic commerce to its logical absurdity; it only means that we are endeavoring to rearrange the handicap between laborer, capitalist, employer, and landlord, according as either becomes the predominating partner in legislation. It is impossible to get out of the

confused aims of social reformers anything like a point of view, or an idea of social progress ; it is a question of *evils* rather than *ideals*. Collectivism, as I have said, implies the consciousness by society of a social ideal, of a better form of itself, and its distinction lies in its clearer consciousness of the end to be attained and its conception of the means of attaining it. The means, as we know, are the collective control or collective administration of certain industries* by the community as a whole—"by the people for the people." (The ordinary formula of the "nationalization of the means of production" is unnecessarily prophetic, and is rather a hindrance than a help to the understanding of the ideal ; by itself, it does not give the point of Socialism, and belongs to the picture-book method of social philosophy, which presents us rather with a ready-made system than a principle of action to be progressively applied.) But, clearly, "control," "organization," "administration," are merely forms, the body without the soul ; we want to know—organization in what direction, control to what end? And the answer in quite general and formal terms is (as already suggested) a certain kind of existence and a certain standard of life to be maintained in and through the industrial organization of social needs. Mere nationalization, or mere municipalization, of any industry is not Socialism or Collectivism ; it may be only the substitution of corporate for private administration ; the social idea and purpose with which Collectivism is concerned may be completely absent. The presence of the idea is recognized by the extent to which the public machinery is made the conscious and visible embodiment of an ideal type of industry, taking form in certain standard conditions of production as also certain standard requirements of consumption. It is agreed that there are certain things which society is so concerned in getting done in a certain way and after a certain type, that it cannot leave them to private enterprise. We may recall Aristotle's arguments in favor of public as against private education ; the important consideration being that education involves principles affecting the kind of social type and character which a particular society is interested in maintaining. The modern industrial state is beginning to realize that it is as deeply concerned in the conditions of industry that determine for better or worse the type and character of its citizens and the standard of its social life. This recognition implies the action of the general or collective will and purpose (which is, of course, also the will and purpose of individuals), represented by the social regulation of industry in the interest of a standard of industrial character and production—a standard of life—which society as society is concerned to maintain. The Collectivist calls upon society to face the logical requirements of the situation ; rightly or wrongly, he conceives that

* I am not now concerned with any further specification of these expressions, as this belongs to a more strictly economic inquiry. Mr. Hobson's "Evolution of Modern Capitalism" deals with some of the aspects. Cf. also Fabian Tracts generally. "The community" means parish, district, municipality, or nation, as democratically organized. I assume throughout that modern Socialism means emphatically industrial democracy, that is, the realization in the industrial sphere of the principle already realized in the sphere of politics and religion.

a requirement of this kind is incompatible with the existence and the *raison d'être* of "private competitive enterprise." He is trying to familiarize the community with the incompatibility by "example and practice," and at the same time to show that it is not with business, but with modern competitive business that the requirement is incompatible. What is good in ethics cannot be bad in economics, and *vice versâ*, is an axiom of Socialism. A standard wage, for instance, is from the point of view of modern commerce a non-competitive wage, for it is not regulated by the supply and demand of the market ; but from the point of view of good business and also good ethics, it is competitive ; men are selected for their efficiency, and not for their cheapness. The attempt to enforce this method of remuneration upon government and public bodies, as also to abolish the contractor,* is described and resented by the ratepayer as "Collectivist ;" he is right in his description, not in his resentment. The School Board, again, adapts its scale of salaries not to the supply of the market, but to the service required. It is only an individualist who can talk of "high" wages and "high" salaries in this connection ; a high wage is simply a wage that is adequate to a certain kind of work done at its best ; the wage is high according as the conception of the conditions required for the highest performance of the work is high. The Socialism of the School Board is, in the last resort, nothing else than a high standard of education, and therefore of the educator and his conditions of life. It is well to put it in this way, because it is often supposed that Collectivism or Socialism is simply a policy of securing better conditions of life for the worker, which gives the impression that it is a class and not a social point of view. The starting-point of social economics is, after all, consumption, and again its qualitative, not merely its quantitative development, rather than the conditions of work and worker as such ; they are, of course, really aspects of the same thing, as readers of Ruskin are in no danger of forgetting. Accordingly, we find that the economic problem is not approached by the modern Socialist primarily from the side of "distribution," except so far as it affects the character of "production" or "consumption." Anyhow, the great thing is that the point of view is qualitative ; or, the regulative idea of Socialism is the maintenance of a certain standard of life, whether it is looked at from the point of view of the condition of the producer or his product. The whole point of factory legislation, again, lies in its attempt to exercise such social control over the conditions of industry as will prevent them from lowering the standard of life which society as society is interested in maintaining ; it is becoming less sentimental, and more scientific in its scope ; and, again, it is now called "Collectivist."

Socialism and Humanism.

From the standpoint of such an interpretation of the "idea" and the "phenomena" of Collectivism (which is, after all, sufficiently

* Cf. Mr. Sidney Webb's admirable vindication of the "Economic Heresies" of the London County Council,—*Contemporary Review*,

justified by the language of its opponents), the suggestion that it is theoretically careless of the type, indifferent to any standard of life, or to the claims of character, is somewhat wide of the mark. So long as Socialism remains true to its scientific conception and treatment of life, it is not likely to commit itself to means of improvement at the cost of the type. Its animating idea is neither * pity nor benevolence—at least, not as usually understood—but the freest and fullest development of human quality and power. It is characteristic of modern Socialism or Collectivism that its typical representatives are men who have been profoundly influenced by the positive and scientific conception of social life; while its popular propagandists have derived their inspiration from Ruskin, who is, in economics at least, a profound humanist. What is common to the indictment of modern industrialism, set out in “good round terms” by Ruskin, Morris, Wagner, Mr. Karl Pearson (not to mention others) on the one hand, and “Merrie England” on the other, is their sense of the frightful and quite incalculable waste and loss of quality (in producer and product) that it seems to involve. Whether this finding is just or not, Socialism is a principle which stands or falls by a qualitative conception of progress. It is bound up with ideas of qualitative selection and competition, and with the endeavour to raise in the scale the whole machinery, the whole conception and purpose, of industrial activity, so as to give the fullest scope to the needs and means of human development. Increase of human power over circumstance, increase of humanizing wants, increase of powers of social enjoyment—these are the ends of state or municipal activity, whether it take the form of model conditions of employment, and model standards of consumption, or the provision of parks and libraries and all such things as are means, not of mere, but of high existence.† And, in all these directions, it would be true to say that the State or municipality operates through character and through ideas, and that, as the organized power of community, it helps the individual not to be less but more of an individual, and because more of an individual, therefore more of a definite social person.

The Meaning of State Activity—National and International.

State activity, as thus conceived, is not the substitution of machinery for the mainspring of character, but a process of training and adaptation, or it may be of restriction and elimination—the human analogues of “natural selection” in the physical world. In this way the State, while it endeavors to give the personal struggle for existence a distinctively human and qualitative form, gains a

* Socialism without pity is empty, but a Socialism of mere pity is blind; and as I am concerned with the idea and method rather than the sentiment or psychological stimulus of Socialism, what may appear as an ultra-scientific view should not be misunderstood.

† On the “Socializing of Consumption” cf. Smart’s “Studies in Economics”; also the writings of Mr. P. Geddes and Mr. Hobson, among others. There is certainly a sense in which “Consumption” is the beginning and end of Economics.

clearer consciousness of the meaning of its own struggle for existence in the social world as a whole. And, just as it raises the plane of competition within its own social group, so it raises it in relation to other groups in the wider social organism. The study of great social experiments in Germany, the comparison of "experiences" at International Congresses, and other movements, suggest that there may be a more valuable kind of rivalry between nations than that of mere power, mere trade, or mere territory—a rivalry of social type and efficiency, within the limits of the specific part each is most fitted to discharge in the whole. The law of national self-preservation, upon such a view, passes from a non-moral to a moral stage, for it is not a mere and exclusive, but a specific and inclusive "self." Anyhow, one effect of Collectivism would be to increase the self-consciousness of a State as organized for the attainment of a common good and a certain kind of social existence; and this consciousness is, from the Socialist's point of view, an increasingly determinate factor in social evolution, just as it is the worst effect of competitive industry that the idea of the State and the conception of a social ideal either disappears or becomes vulgarized and materialized.

The Distinction Between "State" and "Society."

It is worth while to dwell for a moment upon a distinction which is often placed to the credit of modern, as distinguished from Greek, political philosophy—the distinction between "Society" and "the State." When the political community is regarded as "Society" it is looked at as a number of individuals or classes, or professions—as an aggregate of units. When we speak of the "State," we understand a single personality, as it were, representing all these interests and endowed with force which it can exercise against any one of them. In other words, "the State" cannot be reduced to "Society" or to "Government," which is only one of its functions, but is Society organized and having force. This distinction in one way implies an advance: we can and do leave more than the Greeks to social influence, as distinguished from the action of the State, because the foundation of social morality is stronger and deeper, and because we lay more stress on individual freedom and the value of the individual. But, in another way, it implies a loss, and is apt to degenerate into the idea that the State has no moral function, and that the individual possesses separate rights which only belong to him as a member of a community. To vulgar political Economy, for instance, as to the Liberty and Property Defence League, "the State" simply means Society; and there has been a tendency on the part of Economists who start with the commercial point of view to push to the extreme the view that the best result will come from the free interaction of conflicting interests, to take this view as final and make it a "law." Modern thought and modern practice are reverting to the position of Aristotle, that the State ought to put before itself "the good of the whole," by interfering with the "natural" course of economic events in favor of collective ends. And it is Democracy that has made Collectivism

possible: the State is not some mysterious entity outside individuals, but simply represents the individuals organized for a common purpose, whether in parochial or national assembly. When, therefore, German Social-Democracy avows its aim to be the substitution of "Society" for the "State," this is simply a sign of arrested political and social development: the State is not co-extensive with the self-governing community, but represents oligarchic and centralized bureaucracy. To depreciate the stress which Collectivists lay upon "organization" is really to depreciate the value of the moral atmosphere any particular manifestation of Collectivism may generate in familiarizing the members of the community with the idea of the social reference and destiny of industry, and of the State as the expression of the nation's will and conscience.

General View of Socialism and its Justification.

Whatever else, then, Socialism may be, it certainly implies organized action for a social purpose, and this purpose may always be reduced to the conception of a certain standard of life other than mere animal existence.

I am aware that this representation of Socialism, as concerned with the maintenance of natural selection under rational human conditions, does not cover all the visible phenomena of Socialism. But the philosophic student is justified in limiting his view to the conception of Socialism as a reasoned idea of social progress; and it is its shortcomings in this respect that the "moral reformer" selects for condemnation. His criticism may, perhaps, be roughly indicated as follows: Socialism, it is suggested, aims at the substitution of machinery for character, in the sense that it fails to recognize that the individual is above all things a character and a will, and that society, as a whole, is a structure in which will and character "are the blocks with which we build"; it attaches, therefore, undue, if not exclusive, importance to material conditions and organization; and, further, it is fatal to the conditions of the formation of character, these conditions being private property competition (of character). In all these points we may discover a confusion between the "Appearance" and the "Reality" of Socialism.

Socialism and Machinery.

No doubt, at first sight, it seems to be the common idea of all Socialists that, by reconstructing the machinery of the actual material organization of life, certain evils incidental to human life, of which that organization is regarded as the stronghold, can be greatly mitigated, if not wholly removed. The theory of modern Socialism gives no countenance to this conception of the matter. It suggests neither utopias nor revolutions in human nature or modern business: it does suggest a method of business which makes rather larger demands upon human nature, but which, at the same time, and for the same reason, is "better" business. Even if that were not so, it is clear that Collectivism is, as I have said, not machinery, but machinery with a purpose; what it is concerned with is the

machinery appropriate to a certain spirit and conception of industry. It implies therefore emphatically ideas, and can only operate through "will and character." If, for instance, the machinery of public industry is not directed to keeping this idea before its employees from the highest to the lowest, then they stand in just as much a material and mechanical relation to their work as the employee of a private person or company; and, on the other hand, in proportion as the employee, through want of will or character or intelligence, fails to enter into that social purpose, his work would be as inferior in itself and in its relation to his character as it might be under any individualistic administration. As a practical corollary, the machinery of public industry must be organized in such a way that the workman can feel its interest and purpose as his interest and purpose.* The mere substitution of public for private administration is the shadow and not the substance. The forces required to work Collectivist machinery are nothing if not moral; and so we also hear the complaint that Socialists are too ideal, that they make too great a demand upon human nature and upon the social will, and imagination. Of the two complaints, this is certainly the more pertinent. A conception, however, which is liable to be dismissed, now as mere mechanism, now as mere morality, may possibly be working towards a higher synthesis. May it not be the truth that Socialism is emphatically a moral idea which must have the machinery fitted to maintain and exercise such an idea—for a moral idea which is not a working idea is not moral at all—and this machinery is, formally speaking, the public control and administration of industry. Every advance in ethics must be secured by a step taken in politics or economics. Socialism implies both a superior moral idea and a superior method of business, and neither could work without the other. The superiority of the moral idea can only show itself by its works, by its business capacity, so to speak; and the superiority of a method of business lies in what it can do with and for human nature. It follows, therefore, that, just as Democracy is the most difficult form of government, Socialism is the most difficult form of industry, because, like Democracy, it requires the operation of ideas; and the test of the perfection of Socialist machinery is just its capacity to give to the routine industries of the community that spirit and temper which are the note of the freest and highest work. Apart from this atmosphere of interest and purpose, the State and municipality are distinctly inferior as employers of labor, and the history of the co-operative movement itself provides a series of object lessons in the divorce of machinery from ideas. In its complete form as the organization of production by the consumers, Socialism presupposes a responsiveness in producer and consumer, and Trades-Unions of producers would be as much a part of Socialist as of individualistic organization, as witness the National Union of

* This is the proper significance of the principle of the Co-partnership of Labor, which is apt to be too exclusively envisaged in "the self-governing workshop" or (private) profit-sharing, and is for that reason hardly given the recognition or prominence by Socialists it deserves

Elementary Teachers. On the other hand, if it has sufficient ground-work in moral and intellectual conditions, then the material organization itself helps to create the character it presupposes, and will be educative, in proportion as the employee of the community feels his social recognition in a raised standard of life all round—shorter hours, dignity and continuity of status, direct responsibility. It cannot be said that Socialists are insensible to the amount of education—in ideas and character—that is required before any sensible advance can be made in the direction of co-operative industry. On the other hand they do not believe that grapes can grow upon thorns: they believe that things make their own morality. The idea of industry is what habit and institutions make it: it is impossible to put the social idea into institutions* which make for the artificial preservation and encouragement of an antagonistic idea—the plutocratic ideal; and it is impossible to get it out of them. It is not enough to modify the bias of the individualistic organization of society: that organization itself makes the whole idea of the organization of society on the basis of public service or labor “the baseless fabric of a vision.” The moralist demands, and rightly (in theory) demands, that the working-man should realize that he exists only on the terms of recognizing and discharging a definite social function. But what is there in the economic arrangements under which he finds himself, to suggest such an idea—the idea on which Socialism rests—either to the propertied or to the propertyless man? How is a man who depends for his employment upon a mechanism he can in no wise control or count upon, and upon the ability of a particular employer to maintain himself against rivals, enabled to realize a definite position in the social structure? What he does feel, for the most part, is that he is dependent on a system in which the element of chance is incalculable, and it is just this feeling which makes for a materialistic and hand-to-mouth conception of life. Or what is there in the economic structure of society which suggests to the employer or the capitalist, that their *raison d'être* is not so much to make a fortune as to fulfil a function? In what way, in a word, does the individualistic organization† of industry make for the extension of the sense of duty which a man owes to society at large? Moral ideas must have at least a basis in the concrete relations of life. In the same way, we are told, and rightly told, that the value of property lies in its relation to the needs of personality. But how can a man who cannot count on more than ten shillings a week, or at any rate the man who depends upon casual employment or speculative trades, regard property as

* Cf. J. S. Mill's "Autobiography," pp. 230-234, *e.g.*, "Interest in the common good is so weak a motive in the generality, not because it can never be otherwise, but because the mind is not accustomed to dwell on it as it dwells, from morning to night, on things which tend only to personal advantage."

† The private organization of industry is often defended on the ground that it provides the morality of "faithful service." But democracy requires the substitution for private or personal services of public service, which admits of just as much personal, and certainly more social, "faithfulness"; and Socialism is bound up with democracy.

"the unity of his material life"? "A man must know what he can count on and judge what to do with,"—this is stated to be a requirement of morality (as it is certainly is of Socialism). But how is this condition realized under a system which not only lends itself to the most violent contrasts between careless ease and careworn want, between lavish indulgence and narrow penury, but makes it the (apparent) interest of the employing classes that the employed shall not have property—a situation which Trades-Unions were meant to meet. Moral ideas are, after all, relevant to a particular working organization of life. The "moral Socialist" seems to require a Socialist ethics of property and employment from an economic system which is worked upon an individualistic conception of property and employment. But the moralist who insists on the fulfilment by society of ideas for which its actual institutions and every-day life give no warrant seems to suggest that ethics are not relative, that moral conceptions are not ideas *of* life, but ideas *about* life. To this abstract moral idealism and transcendentalism, Socialism, at any rate, furnishes a needful corrective. Is there anything, the Socialist asks, in men's ordinary industrial life which suggests the "lofty and ennobling" ideas they are to have about it? And I conceive that the Socialist who criticises the economic arrangements of society from the standpoint of these ideas is the more helpful moralist of the two. He has done well if he has simply called attention to the antinomy; and, in a sense, that is the only remedy, for, unless it is felt and recognized, there is nothing from which anything better can grow up. If institutions depend on character, character depends on institutions: it is upon their necessary interaction that the Socialist insists. The greatness of Ruskin as a moralist lies in his relevance, and in his recognition of the inseparability of the moral and the material, of ethics and economics. But the practical man calls him a moral rhetorician and an insane economist.

"Moral" and "Material" Reform.

Apart from the general value of economic organization or of the consideration of it, the moral Socialist certainly tends (in theory) to minimize, if not to discount, the influence of material conditions on the betterment of life. The great thing, we are told, is to "moralize" the employer, or "moralize" the workman. The only radical cure for the sanitary atrocities of the Factory system lies, it is said, in a wider interpretation of their duty by the employers. Why is it, one may ask, that a system against which it is considered superficial, or indeed immoral, to "agitate," lends itself to this appeal from the employer's sense of interest to the employer's sense of duty? The Socialist suggests a system of industry in which self-interest does not require to be checked. And is it quite reasonable or consistent to complain, on the one hand, that Socialism does not provide the economic motive of private profit, and, on the other hand, to look for the improvement of the conditions of the laborer to the moralization or socialization of the motives of the employer? The evils which the moral Socialist admits are just those for which a radical

cure can only be found in the popular control of industry. Or, are we to say that "the morality of the working classes" depends, not upon "circumstances," but upon some mysterious gift of grace or redemption? The intimate connection between "circumstances" and drinking, the degrading effect of material uncertainty (which the doctrinaire moralist seems to regard as an unmixed moral benefit—for the working classes), are, at any rate, as normal phenomena as the powerlessness of a "degenerate" to cope with such conditions at all. A good deal more investigation is surely needed of the conditions under which "character and ideas" operate before we can so easily assume their spontaneous generation and their indefinite possibilities. Universalize the principle, and it is doubtless good for all persons that they should not be above the possibility of falling into distress by lack of wisdom and exertion; competition is in this sense a sovereign condition of life, and the Socialist regrets that more room is not made for its beneficent operation in the "moral development" of our "splendid paupers." There seems to be just a tendency on the part of the Charity Organization Society to treat the working-classes as if they had peculiar opportunities for independent life, just because their circumstances are so difficult; the eye of the moral disciplinarian should surely also be turned upon the many people who are as much pensioners of society as if they were maintained in an alms-house. The poor man's poverty (it would seem) is his moral opportunity. But this kind of beatitude for the poor would have more point if it were always their own lack of wisdom and exertion which occasions their "falling into distress." It must be admitted that the existence of an unemployed rich is as great a source of danger and deterioration to society as that of an unemployed poor, and to a great extent the one is an aggravating cause of the other. Much of the casual employment of the employed classes directly ministers to the unproductive and exclusive consumption of the rich; and one great difficulty in the way of the organization of production on the basis of rational and persistent wants, and the provision of a true industrial basis to the life of the worker, lies in the irregular, capricious, and characterless expenditure of superfluous incomes.

The Insufficiency of the Charity Organization Society.

All that our "Poor Law Reformers" have to say about the policy of "relief works," "shelters," and relaxation of the Poor Law is undeniable; but the corollary that in "refraining from action" we are helping on a better time seems hardly adequate, however graphically it can be illustrated from the history of unwise philanthropy. So long as the Charity Organization Society contents itself with the demonstration that devices of this kind only drive the evil further in, it is really helpful; but in refusing to look for any source of the evils except foolish benevolence on the one side and reckless improvidence on the other, it seems to be unduly simplifying the conditions of the problem. It is, at any rate, scarcely justified in deprecating the inquiry as to whether the absence of any rational organization of

industry may not be a part of the situation. Thinkers of this school are so much concerned for the moral independence of the worker that his actual economic dependence hardly enters into their consideration. The circumstances beyond the control of great masses of workers engaged in machine industries are much larger than those that their own action goes to make up, and here again Collectivism endeavors to bring these circumstances much more within their control. Lack of employment means, we are told, lack of character ; but where, after all, does character come from ? The contention of Socialists is that the absence of any permanent organization of industry, by setting a premium upon partial and discontinuous employment, is itself a contributory cause of shiftless character ; and where the character is hopeless, the best way of dealing with it is such an organization as would really sift out and eliminate the industrial residuum. All permanent organization means the withdrawal of partial and inadequate employment from a certain class.*

Surely in this case system and character act and react : discourage intermittent employment, and you save the "marginal" cases from social wreckage ; while it becomes possible to deal with the industrial residuum in some restorative or restrictive way. But is not this the point of Collectivism ? The Fabian Society has repudiated the false economics of "relief works" with quite as much energy as the Charity Organization Society. But the real objection to relief works, as also to "Old Age Pensions," is that they have no logical connection with the system they are designed to palliate. "Continuity of employment" and "superannuation pensions" would be a logical part of a Socialist state ; but the idea of "the State" as a relief society to the employees of private industry can only be satisfactory to the employer, whose irresponsibility it would effectually sanction. Under a system of individualistic industry, "State relief" and "State pensions" can only mean an allowance in aid of reckless speculation and low wages ; and these devices only serve to distract reform from the true line of deliverance—the best possible organization of industry and the improvement of the conditions of labor. It is not the Socialist who contemplates the "ransom" of the capitalistic system by relief work and old age pensions.† I do not think that even the most impatient Socialist has ever suggested that out-door relief in any shape was Socialism ; while the scientific Socialist has never regarded so-called wholesale "Socialistic remedies" of this kind as other than the herring across the track. Socialism means the organization not of charity, nor of relief, but of industry, and in such a way that the problem of finding work which is not apparently wanted, and of devising pensions for no apparent service, would not be "normal."

* The net result of organization at the Docks was, we are told, in the direction of confining to about 6,000 people the work which had previously been partial employment for between 12,000 and 10,000. Cf. also the unorganized "cab-tout," etc.

† On the other hand, Pensions—and even carefully guarded and exceptional relief schemes—might be regarded as part of a transitional policy. The Socialist who advocates Old Age Pensions is at the same time advocating a different conception and consequent method of industry, and not simply trying to save the credit of a discredited system.

Socialism and Natural Selection.

The real danger of Collectivism, indeed, is not that it would take the form of the charity that fosters a degraded class, but that it would be as ruthless as Plato in the direction of "social surgery." It may take a hard and narrow view of the "industrial organism" and the conditions of its efficiency. For the progress of civilization gives a social value to other qualities, other kinds of efficiency, than merely industrial or economic capacity. "Invalidism" may be said to develop valuable states of mind, and to strengthen the conception of human sympathy and solidarity. It is possible to apply the conception of an industrial organism in two ways: the State is an organism, and therefore it should get rid of its weak; the State is an organism, and therefore it should carry its weak with it. Perhaps, it might be said that the modern problem is not so much to get the weak out of the way, as to help them to be useful. There is no reason in the process of natural selection, as such, why every member of society, provided he be not criminal, should not be preserved and helped to live as effectively as possible. But this would depend upon the possibility of such a readjustment of the economic system that would enable all members to maintain an efficient existence under it, and, conversely, upon the condition that each person should do the work for which he is best fitted. "Weakness" and "unfitness" are, after all, relative; and in any more systematic organization of society what is now a man's weakness might become his strength. One advantage of the organization of industry would be the increased possibility of "grading" work, as also of estimating desert. The problem is no other than that of finding a distribution of work which would allow the weak to render a service proportioned to their ability in the same ratio as the service is required of the strong. The present system makes too little use of the weak and too much of the strong; instead of helping the growth of all after their kind, it fosters an overgrowth of an exclusive and imperfect kind. And, lastly, if it be said that any form of Socialism would be immoral if it denied the necessity for individual responsibility, it may also be urged that the compulsory elevation by municipal and State activity of the most degraded classes is a necessary preliminary to their further elevation by individual effort and voluntary association. But none of these considerations seem germane to private competitive enterprise, which can hardly afford to "treat life as a whole." From all these points of view, therefore, I venture to think that the question of morality is largely a question of machinery, and that the consideration of morality apart from machinery reduces ethics to the level of a merely "formal" science.

Socialism and Property.

Socialism recognizes the value of property by demanding its wider distribution. The social situation is, upon its showing (rightly or wrongly), largely created by the divorce of the worker from property and the means of production, which means that the arrangement and disposition of his life is outside his control. Private

Property may be said to have an ethical value and significance so far as it is at once a sign and expression of individual worth, and gives to individual life some sort of unity and continuity. It follows that wages and salaries, on which society is largely, and under Collectivism would be wholly based, fulfil the principle of private property so far as they are in some degree permanent and calculable ; otherwise, there is a discontinuity in the life of the individual ; he cannot look before and after, cannot organize his life as a whole. Socialists not only accept the "idea" of individual property, but demand some opportunity for its realization.* One point of the public organization of industry is that it would admit of more permanency, stability, and continuity in the life of the worker than is provided by the precariousness of modern competition. His life, it is contended, is much more exposed than it need be to the worst of material evils—uncertainty. The "Trust" organization of industry, as also the organization of dock labor, are in this point in the line of Socialist advance ; and it is well known that the civil service attracts because it not only secures the livelihood of the employed, but leaves him time for volunteer work in pursuit of his interests and duties, private and public. Or, again, we are told that the social need is to make the possession of property very responsive to the character and capacity of the owner. Could the endeavor of Socialism be better expressed ? Socialism does not, like certain forms of Communism, rest upon the idea that no man should have anything of his own ; it is concerned with such an organization of industry as shall enable a man to acquire property in proportion to his character and capacity, but will cease to make the mere accumulation of private property a motive force of industry. Just to the extent that property serves the needs of individuality, Socialism would encourage its acquisition : the idea of hand-to-mouth existence or "dependence," the ideal of the slave or the child, is probably much more encouraged by the fluctuations of competitive industry than by the routine but regular and calculable vocation of the public servant.

It may be further considered that it is the object of Collectivism not merely to give a true industrial and calculable basis to the life of the worker, but to give to the possession of property character and propriety. There is a justifiable pleasure in surrounding one's self with things which really express and respond to one's own character and choice of interest, and in the feeling that they are one's own in a peculiar and intimate sense. But the number of books, pictures, and the like, which one "desires for one's own," is comparatively small, and would be much smaller, if one had within reach a museum, a library, and a picture-gallery. The property that is revolting is that which is expressive, not of character, but of money ; the house, for instance, of "a successful man" made beautiful "by contract." Emerson's exhortation to put our private pictures into public galleries is perhaps extreme, and not altogether

* Throughout this discussion I am thinking of "the enjoyment of individual Property" as distinct from the employment of private Capital and the private possession of Land.

practical or reasonable. But the public provision of libraries and galleries, and of things that can be best enjoyed in common, not only enlarges the background of the citizen's life and adds to his possessions, but suggests a reasonable limit to the accumulation of property; as it would most certainly give a social direction to art, when it could minister to the needs of a nation rather than the ostentation of the few. And the same may be said of public parks, means of transit, and the like—all in the direction of levelling those inequalities of property which serve no social purpose. Whether, then, property be regarded as a "means of self-expression," or as "materials for enjoyment," the Collectivist ideal may be said to lie in the direction, not of denying, but of affirming and satisfying the need; and the Socialists criticise the distribution of property under individualistic institutions just from the point of view of its failure to satisfy a need of human nature. Mr. Bosanquet,* for instance, really expresses the Socialist's position when he says: "The real cause of complaint to-day, I take it, is not the presence, but the absence of property, together with the suggestion that its presence may be the cause of its absence." He points out, moreover, that the principle of unearned private property and the principle of Communism really meet in the common rejection of the idea of *earning*, of some quasi-competitive relation of salary to value or energy of service—in fact, of the organization of Society upon a basis of labor, which is the ideal of Socialism. Similarly he puts himself at the point of view of the Socialist when he says: "The true principles of State interference with acquisition—and alienation—would refer to their tendency, if any, to prevent acquisition of property on the part of other members of society," a principle which omits nothing in Collectivist requirements, and opens up a series of far-reaching considerations.†

Socialism and Competition.

I have already endeavored to show that Socialism is a method of social selection according to social worth (in the widest sense): that it desires to extend the possibilities of usefulness to as many as possible, and would measure reward by the efficiency of socially valuable work. The differences in reward would, however, be of less account in proportion as social consideration and recognition, and the collective privileges and opportunities of civilization, are extended to any kind of worker, and as the motives to personal accumulation are reduced within social limits.‡ Indeed, it is a question whether the conven-

* In "Some Aspects of the Social Problem," which originally suggested this paper.

† Cf. The "Land Nationalization" propaganda generally. For the sake of their economic case, as also for purposes of political propaganda, it is regrettable that modern Socialism gives more prominence, in its theory, to "Capital" than to "Land"—but cf. the works of Achille Loria and his school.

‡ Cf. Mill ("Autobiography") and Marshall ("Principles") on the "Motives to Collective Action"; also Sidney Webb's "Difficulties of Individualism" (Fabian Tract No. 69). "A social system devised to encourage 'the art of establishing the maximum inequality over our neighbors'—as Ruskin puts it—appears destined to be replaced, wherever this is possible, by one based on salaried public service, with the stimulus of duty and esteem, instead of that of fortune-making."

tional idea of reward is relevant to the system of industry contemplated by the Socialist, a system under which the freest industrial motive—the motive of work for work's and enjoyment's sake, the stimulus of self-expression—could be extended from the highest to the humblest industry. The incompatibility of pure industrial motive with our modern industrial system is, indeed, as Ruskin and Morris and Wagner have witnessed, its profoundest condemnation.

The Benefits of Commercial Competition.

It is not to be denied that competitive private enterprise may develop character and discharge social services. But the character and the services are of a partial and inferior type: partial, because a few grow out of proportion to the rest, and therefore in a narrow and anti-social direction; inferior, because the character of the economically strong is not of the highest type; if it is of a type fittest to survive in a commercial and non-social world, it is not the fittest to survive in a moral and social order. And what can one say about the quality of products and standard of consumption? Is it as such directed to evolve and elevate life? Matthew Arnold's description of an upper class materialized, a middle class vulgarized, and a lower class brutalized, is a fairly accurate description of modern commercial types.

Competition and Population.

Not only is commercial competition inferior in form, but it is directly responsible for an increase in quantity over quality of population. The idea that unchecked competition makes for the natural selection of the fittest population is singularly optimistic. It is just that part of the population which has nothing to lose that is most reckless in propagating itself. The fear of falling below the standard of comfort at one end of the social scale, and the hopelessness of ever reaching it at the other, combine to increase the quantity of population at the cost of its quality. And what is a loss to society is a gain to the sweater; he is directly interested in the lowering of the standard of life, and in the competition of cheap labor; and the sweater is a normal product of commercial competition. Collectivism deliberately aims at the maintenance and elevation of the standard of life, and at such an organization of industry as would not enable one class of the community to be interested in the overproduction of another. It treats the "population question" as a problem of quality.

Socialism and Progress.

There are, of course, many other aspects of Socialism than its adequacy to the requirements of a moral and social idea; that is, of the principle of a progressive social life. It may be thought that Socialism is essentially a movement from below, a class movement; but it is characteristic of modern Socialism that its protagonists, in this country at any rate, approach the problem from the scientific rather than the popular view; they are middle class theorists. And the future of the movement will depend upon the extent to

which it will be recognized that Socialism is not simply a working man's, or an unemployed, or a poor man's question. There are, indeed, signs of a distinct rupture between the Socialism of the street and the Socialism of the chair; the last can afford to be patient, and to deprecate hasty and unscientific remedies. It may be that the two sides may drift farther and farther apart, and that scientific Socialism may come to enjoy the unpopularity of the Charity Organization Society. All that I am, however, concerned to maintain is that there is a scientific Socialism which does attempt to treat life as a whole, and has no less care for character than the most rigorous idealist; and I believe I am also right in thinking that this is the characteristic and dominant type of Socialism at the present day. It may not be its dominant idea in the future, but it is the idea that is wanted for the time, the idea that is relevant, and it is with relevant ideas that the social moralist is concerned.

Other Moral Aspects: Socialism and Religion.

There are, again, other moral aspects than those with which I have been concerned. I have said nothing as to the moral sentiment of Socialism, nothing as to the creation of a deeper sense of public duty. I have taken for granted the sentiment, and confined myself to its mode of action, or the more or less completely realized moral idea of Socialism, and tried to see how it works, or whether it is a working idea at all. The question of moral dynamics lies behind this, and the question of faith—as the religious sentiment—still further behind. Perhaps in an anxiety to divorce Socialism from sentimentality, we may appear to be divorcing it from sentiment. But the sentiment of Socialism must rest on a high degree of intellectual force and imagination, if it is not to be altogether vague and void. There is no cheap way, or royal road, to the Religion of Humanity, though there may be many helps to it short of a reflective philosophy. But it would be idle to deny that Socialism involves a change which would be almost a revolution in the moral and religious attitude of the majority of mankind. We may agree with Mill* that it is impossible to define with any sort of precision the coming modification of moral and religious ideas. We may further, however, agree that it will rest (as Comte said) upon the solidarity of mankind (as represented by the Idea of the State), and that “there are two things which are likely to lead men to invest this with the moral authority of a religion; first, they will become more and more impressed by the awful fact that a piece of conduct to-day may prove a curse to men and women scores and even hundreds of years after the author is dead; and second, they will more and more feel that they can only satisfy their sentiment of gratitude to seen or unseen benefactors, can only repay the untold benefits they have inherited, by diligently maintaining the traditions of service.” This is the true positive spirit, and in something like it we must seek the moral dynamics of Socialism.

* John Morley's "Miscellanies": "The Death of Mr. Mill." Cf. also the passage on Socialistic sentiment in Mill's "Autobiography."

LABOR IN THE LONGEST REIGN.*

THE "Sixty Years' Reign" of Queen Victoria—1837 to 1897—inevitably produces a crop of comparisons between the condition of the people at the two dates. At first sight, nothing is more conducive to our self-complacency.

If the Chartists, in 1837, had called for a comparison of their time with 1787, and had obtained a fair account of the actual social life of the ordinary working man at the two periods, it is almost certain that they would have recorded a positive decline in the standard of life of large classes of the population. And if the Spenceans or the "Corresponding Societies" of 1787 had compiled a trustworthy comparison of that year with 1737, it is probable they must have marked a similar decline. There seems reason to believe, indeed, that in 1837 some large sections of the "dim inarticulate multitude" were struggling in the trough of a century's decline in all that makes life worth living. Whatever had been of advantage in the patriarchal or semi-feudal relationship between social classes had passed away, without yet being succeeded by the political freedom and mutual respect of democratic organization. The industrial independence which marked the hand industry had been in great part lost, whilst the advantages of the factory system were as yet not universally developed. The poor had lost the generous laxity of the old Poor Law without having yet gained the bracing education in independence which was the main advantage of the new. The parochial and manorial systems of local administration had, in many places, broken down under the enormous growth of population and industry, while the new municipalities were but beginning, and public sanitation and public education were unknown.† And whilst the worst horrors of industrial anarchy prevailed in the mills and mines, not yet subject to any effective legislation, the workman found his food rendered artificially dear by the remnants of the protective system. In almost every respect, indeed, the wage-earner in 1837 was suffering from the surviving evils of the old order, whilst losing all its advantages; and he was already exposed to many of the disadvantages of the new era, whilst enjoying but few of its benefits. Nothing is more difficult than to estimate fairly the comparative well-being of a whole community at different periods. But if one may trust one's impression of numerous converging testimonies, 1737 shows approximately the high-water mark of prosperity, at any rate since the

* Reprinted (by permission), with numerous alterations, from the Wholesale Co-operative Society's *Annual* for 1893.

† Lord Beaconsfield's novel, *Sybil, or the Two Nations*, gives a good idea of some of the horrors of this period, as Mrs. Gaskell's *Mary Barton* does of the poverty of Lancashire. Engel's *Condition of the Working Classes in 1844* (Sonnenschein, 1892) is a picture of the period largely compiled from official reports.

Middle Ages, of the farm laborers and perhaps also of the little handicraftsmen. Their life, no doubt, was then rude and hard, but it had, perhaps, with its yearly bonds and customary wages, more permanence and regularity on the whole than has since been possible. On the other hand, 1837 marks almost the lowest depth of degradation of the English rural population, and a very low level indeed in the condition of the miner and the mill operative. And, therefore, even if 1897 represents a great advance in almost every respect on 1837, we cannot accept this result with any very great self-complacency. In comparing ourselves with 1837 we set an appallingly low standard, and great indeed would be our guilt if amid our huge increase in national wealth no advance on that year were recorded.

It is not possible in a Fabian Tract to attempt a full examination into the condition of the workman to-day as compared with his position in 1837. All that can be done is to give a general impression on the subject, and a few of the many detailed facts which could be cited in support of that impression.* Bad as we are sometimes tempted to think the present condition of the people, it is clear that, on the whole, there has been a substantial advance since 1837. In the great mass of trades, and in nearly all places, the money wages of the men are much higher, and the workman obtains a far larger supply of commodities in return for his labor than he did sixty years ago. In many cases the hours of labor are shorter, the conditions of work are better, and the general standard of life has been considerably raised. The house accommodation, both in town and country, is much improved; the sanitary conditions have often been revolutionized; education is not only far more general, but is also far more extensive; whilst such opportunities for culture as libraries, museums, art galleries, music and healthy recreation are much more accessible to the workman than they ever were before. In a word, the great bulk of the population are far more civilized than they were sixty years ago. Cruel as is our industrial system, life in England is in nearly every respect much more humane than it was. The evils which still exist must not blind us to the progress that has been made. So far the panegyrics of the optimistic statisticians of our time are justified.

Wages.

It is unnecessary to say very much about the general rise in money wages which has taken place since 1837. There seems no reason to doubt, *so far as concerns the male worker*, the general accuracy of Sir Robert Giffen's conclusion that the rise in nearly

* The Queen's Jubilee in 1887 produced a number of "Fifty Years Retrospects," to which reference should be made by those studying the subject. Of these, Sir Robert Giffen's two essays on "The Progress of the Working Classes during the last half-century" (in his *Essays in Finance*, second series, 1887), contain the best survey of the economic facts, presented in a somewhat too optimistic way. Mulhall's *Fifty Years of National Progress* contains a mass of statistics. A more general survey is taken in Sir W. Besant's *Fifty Years Ago* (Chatto and Windus), which contains a mass of interesting particulars as to the social condition of the nation, but is untrustworthy upon economic facts. *The History of Trade Unionism*, by S. and B. Webb, tells the story of the working classes; see also *The Tailoring Trade*, edited for the London School of Economics and Political Science by F. W. Galton (Longmans).

all trades has been from 50 to 100 per cent.* In some of the building trades, for instance, wages have in certain localities actually doubled during the present century. The son of a carpenter in Scotland told me that he remembered his father, about 1850, regularly bringing home 34/6 as his wage—not for one, but for four weeks' work, the system of monthly pays not yet having been abolished. It is true that this was in the neighborhood of Inverness, but I mention the incident to recall the fact that wages have often risen most in obscure nooks and corners of the land which have been opened up by those great levellers of wages and prices—railways and the postal system. But even in Glasgow the minutes of the energetic Joiners' Union show that it was fighting hard between 1833 and 1837 to get a standard rate of 21/- per week, as against 36/- at the present day. And the stone-masons in Glasgow have improved their rate of pay from 5d. per hour in 1853, which is the earliest year for which I could obtain the figures, to 8½d. per hour now. And if we turn to quite another industry, I have ascertained the rate of wages of the engine-men at a small colliery in the Lothians since the year 1831. They begin at 11/- per week, and rise steadily, though with numerous fluctuations, to 23/4 in 1872, and to no less than 33/3 per week in 1892.

The compositors, too, in many places have doubled their money wages during the present century. In Edinburgh, for instance, in 1803 the average earnings of compositors in eleven of the best printing offices of the city varied from 13/9 to 17/11½ per week, the rate being 3½d. per 1,000. The "Interlocutor" of 1805—an order of the Court of Session fixing a scale of piecework rates—raised the average earnings to about 20/3; but from that time until 1861 no advance was made on these rates, and the average earnings of men at piecework in book printing establishments seem positively to have declined during these years. But in the meantime the "stab" system had greatly increased in the city, and "stab" wages had risen from 21/- in 1833 to 26/- in 1861. Edinburgh has never been a good city for compositors, but the rate per 1,000 is now 6¾d., and the minimum weekly wage of men on the establishment is 32/6.†

But perhaps one of the most remarkable instances of improvement of social condition is that of the Northumberland coal miner. Two generations ago, he was a helpless, degraded wage-slave, utterly without the means of resisting the worst abuses of capitalist tyranny. The hewer of 1830, if we may trust a contemporary pamphlet, often received no more than 11/- or 12/- a week for ten or twelve hours a day underground. The miners' delegate meeting settled the strike of 1831 on terms which included a minimum of 30/- per fortnight

* See Sir Robert Giffen's two papers on "The Progress of the Working Classes in the last half-century" (*Essays in Finance*, second series, 1887, pp. 365-409). But it must be remembered that this general rise has not taken place without numerous ups and downs in good and bad times, the details of which for particular trades and in particular localities would well repay study.

† It may be added that the method of computing piecework per 1,000 ens is said to have been introduced in London in 1774, when the rate was 4d. (Edinburgh being 3d. at that time). By 1785 the London rate had advanced to 5½d., where it appears to have remained stationary until 1861, when it was raised to 6d. It now averages 8½d.

for twelve hours a day.* But the miner was constantly cheated in the weight of coal drawn, and in the food and other commodities that he was compelled to buy at his employer's "tommy-shop." Spasmodic rebellions resulted in particular martyrdoms, without producing either any durable combination or any appreciable improvement in the miner's lot. His "yearly bond," enforced by ruthless magistrates, kept him in a position little better than serfdom, whilst the utter absence of any provision for education seemed to leave no ray of hope for any uplifting of his class. Now the Northumberland miner stands in the very front rank of what is often not inappropriately termed the aristocracy of labor. A strong and admirably led Trade Union defends him both from employers' tyranny and the accidental fluctuations of earnings which arise from the changing character of the "face" of the mine. He has secured effective legislative protection against fraud, and, to no small extent, against the avoidable dangers of his calling. He works hard, but his labor is concentrated into fewer hours so as to leave him leisure for public and private affairs.

It would be in the highest degree instructive to study in detail the means by which this beneficent revolution has been accomplished. It is very significant that the Northumberland miners were unable to form any durable Trade Union until the Mines Regulation Act of 1842 had given them some protection from the worst abuses of competition, and that the strength and efficiency of their union has grown in direct proportion to the amount of legislative regulation which the union has been able to procure for their industry. A similar remark might be made concerning the spread of co-operation among them. The Northumberland pitmen appear, indeed, to present an almost perfect example of the manner in which every form of well-devised collective action, whether legislative regulation, Trade Union control, or consumers' co-operation, act and react one upon the other to the permanent elevation of the standard of life.

The splendid progress of the Northumberland coal-hewers has been shared in greater or less degree by many other classes; but it is unnecessary to dwell further upon this side of the question. It will not, I think, be generally disputed that the last sixty years have seen a very great advance in the condition of a very large part of the people. But it is essential to notice the fact that this great advance in prosperity, this great rise in the standard of life, has not been universal. There are living in our midst to-day considerable masses of people who, as regards their economic circumstances, are still in 1837. I have already referred to the difficulty of comparing with any accuracy the general condition of the people at one period with that of another, but there is one datum line which remains pretty constant, and that is the level of mere subsistence. If we find any class existing just at this subsistence level, we may feel quite sure that no great improvement can have taken place in its condition; and if we discover in our midst classes who do not even manage to get enough for durable subsistence—who live, to use Mr. Charles

* See *An Appeal to the Public from the Pitmen*. Delegates' meeting, Newcastle, 6th May, 1831. Reprinted in the Appendix to Fyne's *Miners of Northumberland and Durham* (Blyth, 1873); see *The History of Trade Unionism*, p. 110.

Booth's phrase, "in a state of chronic want"—we may be certain that the lot of these classes can, by the nature of things, never have been any worse even in 1837. Mr. Charles Booth tells us,* in the effective "eloquence unadorned" of his columns of statistics, that some 32 per cent. of the whole four millions of London's population fall within his four classes of "poverty," earning not more than a guinea per week per family. It is difficult to believe that, even in 1837, the percentage of persons at a corresponding low level can have been greater. It is practically certain, remembering the great increase in the total population, that at no previous time were the actual numbers more than at present. It has been reserved for our own prosperous time to produce the spectacle of over a million of people within one city living "in poverty." And when we examine closer into Mr. Booth's appalling details, and begin to realize that out of this huge residuum nearly a third are actually below what can be called even full subsistence for a London family, we shall begin to feel that our boasted progress since 1837 has not, after all, taken us very far. The 300,000 Londoners who fail to get even 18/- a week per family, and live in "chronic want," can never have been poorer. Their actual number in the much smaller city of 1837 cannot have been so great. And if we take into account the slums of our other great cities, and realize that we have in our midst a class of at least a million persons, besides the million at any one time in receipt of Poor Law relief, who live in "chronic want" of even the necessities of life, we shall begin to understand how very partial after all has been our progress.

It is often assumed that this huge residuum which is existing in our midst at starvation wages, is made up entirely of unskilled laborers, women plying the needle, and drunkards and wastrels of all kinds. But this is not the case. The unskilled laborer, indeed, is morally entitled to full subsistence, though he does not always get it; but even men with a trade are sometimes little better off. We find to-day numerous small classes of skilled craftsmen in large towns whose weekly earnings do not amount to a pound a week. The Sheffield fork-grinders, for instance, working at a horribly unhealthy and laborious trade, are constantly found working at time-work for 16/- to 20/- for a full week of fifty-six hours, subject to considerable reductions for lost time. Similarly the Sheffield table-blade grinders, who do the common work, do not get more than a guinea a week net when working full time. Even in the comparatively prosperous textile industries there are large classes of men working as weavers, card-room operatives, &c., who do not make a pound a week. Consider, too, the wages which our civilization allots to adult able-bodied women. It is difficult to believe that the "shilling a day" wages of unskilled women in the East End of London, the 6/- to 7/- a week earned by the Belfast rope-maker or tobacco-worker, or even the 10/- or 12/- earned at piecework by the skilled linen-weaver or Glasgow cotton mill operative, represents any appreciable advance on the scale of the past generation. Women's wages for unskilled labor still gravitate, as a rule, pretty close to the subsistence level,

* See *Life and Labor of the People*, vols. i. to iv.

below which they can never have sunk for any length of time.* Out of the four millions of women who are working for wages at the present time, a very large percentage must be earning practically no better subsistence than their grandmothers did. It is at least doubtful whether any previous age could show so large a total number at this low level. And if we might sum up in one general impression the different facts as to comparative wages, we should, I think, have to come to this conclusion: Whilst the skilled male craftsman has largely increased his income, and a practically new class of responsible and fairly well-paid laborers and machine-minders has come into existence, there exists now a greater sum, though a smaller proportion, of hopeless destitution than at any previous time. It appears at any rate highly probable that in 1897 there are positively more people in Great Britain who are existing at or near starvation wages than there were in 1837, although their number bears a smaller proportion to the whole.

It must not, of course, be forgotten that prices are not the same now as in 1837. The workman pays much more in rent than he did then, not only on account of the positive rise of rent, but also because a far larger proportion of the total population now live and work in towns. Meat, too, and milk, with a few other articles, are dearer. But I see no reason to doubt the statistical conclusion that prices are on the whole lower than in 1837. The reduction in the price of bread is worth more to the agricultural laborer or to the family at sheer subsistence level in London than any alteration in the price of meat. The rise in rent is a real and most serious deduction from the increase of wages, and is no doubt a great cause of the destitution of the urban residuum. The proportion of the income which is paid away for rent is, of course, greatest in the very poorest class, and this accordingly suffers most from the rise. But it is far from being equal to the advance in the money wages of the skilled artizan, whose weekly earnings certainly procure for himself and his family a considerably larger share of comfort and civilisation than could have been commanded by his grandfather. My conclusion is that, on the whole, wages are not only higher but are also worth more than they were before. On the other hand, the increased cost of rent, and meat and milk, presses with undue severity upon the helpless poor of our great cities, and does much to keep their condition down to the old bad level.

Irregularity of Employment.

But it would be misleading to consider only the rate of wages without paying at least equal attention to the extent to which the workman is irregularly employed. The weekly earnings of a stonemason, for instance, may run up to 36/- or 42/- for the time that he is in constant employment, but any estimate of his yearly income would be fallacious in the extreme if it did not take into account that he usually earns little or nothing during the winter months. We cannot, therefore, usefully compare rates of wages unless we at

* For statistics of women's wages—scarcely mentioned by Sir R. Giffen—see an article by the present writer in the *Economic Journal*, December, 1891; and *Studies in Economics* by Professor W. Smart (London; 1895).

the same time endeavor to estimate whether employment has become more or less intermittent and irregular.

Now, on this point of comparative regularity of employment, we have at present practically no statistical information, and the most diverse accounts are given by different witnesses. If we were to believe some of our friends we should conclude that irregularity of employment was a new thing, the product of the competitive system in its decay, unknown to our forefathers. But whatever may have been the case in that semi-mythical golden age of the hand industry, it is quite certain that sixty years ago there were periods of bad trade and widespread lack of employment. Of this we find abundant evidence in all directions. It is unnecessary to do more than refer to the large number of persons who at that time received Poor Law relief. A better index to the chronic lack of employment in the winter months is given by the way in which the numbers in receipt of relief went up as soon as the cold weather set in. But evidence of another, and perhaps more trustworthy kind, is to be found in the records of the old Trade Unions. The skilled craftsman, earning good wages while at work, was then, as now, loth to throw himself on the parish, and some of the early Trade Societies were formed largely with the object of providing maintenance for their members when out of work. Out-of-work pay, or, as it is sometimes expressively termed, "idle aliment," was, as far as I am aware, not given in 1837 by any Trade Union, but elaborate provisions were made to enable men who could not find employment in their town to go on tramp in search of it. "Tramp" had not then become a term of reproach, and the "tramps' room" was a regular feature of every public-house patronized by one of the larger Trade Societies.* The tramp had usually exhausted all his scanty funds before he made up his mind to wander, and it was therefore necessary to organize a regular system of daily relief all over the kingdom. Already, before the middle of the eighteenth century, the wool-combers were associated from Taunton to the Tees in a single widespread association for relieving their travelling members. Their example was followed within a few years by the wool-staplers, and long before 1824 the compositors also appear to have covered the land with a network of local societies, one of whose chief aims was the mutual relief of each other's tramps. The little society of ironmoulders, which started at Bolton in 1809, soon expanded into an organization of national extent with similar objects. The member "clear on the books" who was driven to travel, received a "clear card" which entitled him to a bed in the tramps' room and a shilling or so from the branch secretary at each of the society's branches on his route until he came to a place where he found a job, or until he became "box-fast" and entitled to no more relief. It is needless to say that in those days there were few railways, and practically no cheap means of transit. The tramp, therefore, invariably walked from stage to stage, exposed to all the inclemency of the weather, for he could receive no more than one day's allowance at each station, and the stations were often many

* The tramping system has not entirely died out, but most societies abandoned it between 1840 and 1870, generally substituting the present "home donation" in its place; see *History of Trade Unionism*.

miles apart. And so we find, for instance, the bookbinders enacting in 1835 that "members whose shoes had become defective after travelling eighty miles with a document, could have them repaired at the Union's expense by obtaining an order from the local secretary of the town he was in to that effect."

Of the extent to which this tramping system was used little exact information can be obtained; but the entries in the branch minute-books of this period show that a considerable number of *bona fide* tramps were at all times on the road, and every now and then the complaints became frequent and loud of the large numbers of men arriving with cards from other towns, or leaving, furnished with the same credentials, in search of work elsewhere.

It would therefore be incorrect to assume that irregularity of employment is any new thing, or even that it is greater now than sixty years ago. The building trades were just as much checked by the cold weather then as now. The frozen-out gardeners were quite as familiar a sight to our forefathers as they are to us. The farm laborer depended on the parson and the squire for his winter coals and blankets to at least as great an extent as he will this winter. And if we turn to the more widespread destitution caused by change in fashion or a commercial crisis we find the records of sixty years ago full of evidence of the existence of depressions at least as acute as any we suffer from to-day. The year 1842 was the culminating point of that "rebellion of the belly" which had begun three years before in the Birmingham and Newport riotings, and which took the form of a demand for the "People's Charter"; and throughout the whole period between 1837 and 1848 we find the Chartist movement swelling and contracting in almost exact correspondence with the acuteness of the economic distress of the people. In 1841 and 1842 things got very bad indeed. The harvest for four successive years was wretchedly deficient, and trade seemed to be coming to an end altogether. Genuine hunger strikes took place, and the staple industries of Yorkshire and the Midlands were nearly at a standstill. The cotton trade was so bad that in 1842 some bitter jester placarded Stockport with bills announcing that the whole town was to let. The sufferings of Bolton in January, 1842, are described by one of the strong men of the time in language which palpitates with anger. "Anything like the squalid misery, the slow, mouldering, putrifying death by which the weak and feeble of the working classes are perishing here, it never befel my eyes to behold nor my imagination to conceive. And the creatures seem to have no idea of resisting or even repining. They sit down with oriental submission, as if it was God and not the landlord that was laying his hand upon them'."*

Nor was this widespread lack of employment peculiar to 1842. The following instructive diagram represents the percentage of the members of the Ironfounders' Society in each year, from 1831 to 1896, and of the members of the London Society of Compositors in each year, from 1848 to 1896, who were fortunate enough to be in employment, and is compiled from the official statistics published by those societies. Out of the sixty-six years shown in the case of the

* Colonel Perronet Thompson, in the *Sun*, 9th January, 1842.

Average Percentages of the Friendly Society of Ironfounders who were in employment during each of the years 1831 to 1896 inclusive; and of members of the London Society of Compositors who were in employment in each of the years 1848 to 1896 inclusive.

[Thick black line (—————) : Friendly Society of Ironfounders. Dotted line (.....) : London Society of Compositors.]

The figures at top and bottom of diagram denote the *years*; those at the sides, the *percentage in employment*.

Ironfounders' Society, there have been no fewer than twenty in which the average number of members unemployed has exceeded fifteen in every hundred. The worst point was reached in 1848, when a third of the members were on benefit.* In the case of the compositors, on the other hand, whose society is a local one, and whose trade is for the home market only, there have been only three years out of the forty-nine shown in which the average number of unemployed has exceeded fifteen per cent., and the worst year was 1870, when nineteen per cent. of the members were on benefit.† What the curve shows most graphically is that irregularity of employment due to commercial crises is no new thing.

We are, therefore, driven to the conclusion that whatever deduction from the artizan's nominal income must be made for "short time" at the present day, it is probable that a corresponding reduction would have had to be made from the nominal income in 1837. The statisticians are therefore justified in comparing the weekly wages of the two periods, however uncertain we may be as to the exact amount of the deduction which ought to be made at either of them.‡

It would be beyond my province at the present time to say anything upon the serious problem which this fluctuation of employment presents to the economist and the statesman. But nothing is gained by the assertion frequently made, that it is in any sense a new problem. Rightly understood, the antiquity and persistence of the problem is only an additional reason why our statesmen ought at once earnestly to set to work to find out how to grapple with what is one of the most serious evils of our industrial organization.

* The exceptional percentage of men employed in 1845, and the correspondingly exceptional depression of 1848, denote the growth and collapse of the railway mania, which had an exactly similar effect upon the employment of compositors, though inability to obtain figures earlier than 1848, and the fact that those obtained relate only to the London Society, prevent this from being fully shown in the diagram. It must be borne in mind that, during the period covered by this curve, both the societies have changed from being small minorities of their trades to comprising a very large proportion of the men in them. The proportion of men on the funds would therefore be greater now than in a similar state of trade a generation ago. For perfect accuracy of comparison also, rates, periods, and other conditions of the out-of-work benefit would have to be taken into account.

† The diagram is offered solely for the purpose of comparing the percentage of unemployed members in either society at one period with the percentage so unemployed in the *same* society at any other period. The two curves cannot be compared with each other, as, in addition to the fact that one relates to a national society with members engaged largely in shipbuilding for export, while the other relates to a local society with members engaged solely in home trade, the figures on which they are based are compiled on entirely different methods. Such a comparison, therefore, could not be other than very misleading.

‡ An even more difficult detail in the comparison is the amount of time lost in hours by workmen in so-called constant employment. Sixty years ago employment by the hour was unknown. The yearly bond was still usual among large classes; monthly engagements were very frequent; and, at any rate, the workman was hired for the day or the week. Now, in some trades, he seldom gets paid for quite his full week's hours, and this constant loss of dribblets of his time, whilst it does not appear even in the Trade Union records, must make a real deduction from his nominal income.

Hours of Labor.

But there are other things besides wages to be taken into account in considering the condition of the wage-earner, and one of the most important of these, from the point of view of civilization, is the length of the working day. I believe that the great value of any shortening of the hours of labor lies, as I have elsewhere urged,* not in the absorption of the unemployed, which must, at best, be but partial and evanescent, nor yet in the raising of wages, which is uncertain, but in the increased leisure which the workman gains for life outside his work. A worker who is employed from morning till night, especially if his work is monotonous or without real intellectual dignity, suffers a subtle degradation of character. Instead of a man and a citizen, he becomes merely a "hand." I believe that nothing has so powerfully contributed towards the rise in the standard of life of our wage-earners as the general diminution which has taken place in the hours of labor. The Factory Acts were the salvation of Lancashire.

A hundred years ago the English artizan commonly worked for about seventy-two hours per week. Even this was a reduction from 1747, when in London, at any rate, the bulk of the men worked nearer seventy-five or eighty hours. A rare pamphlet of that year gives us the hours of labor of 118 different trades in London, of which thirteen worked from 6 a.m. to 6 p.m., three from 6 to 7, sixty-one from 6 to 8, thirty-nine from 6 to 9, and two from 5 to 9.† The unregulated greed of the mill-owners in the new textile industries rapidly lengthened the working-day to fourteen and even sixteen hours. One striking feature of this period is the way in which children, usually employed at time wages, were kept at work even longer than the adult workers, among whom piecework was already prevalent. Thus, in 1831, the boys in the Northumberland mines, who were paid by the day, are said to have been kept at work for fourteen to seventeen hours a day, whilst the hewers, paid by the ton, already restricted their shifts to ten or twelve hours each.‡

But by 1837, the ten hours day was becoming generally established as the normal working time of town artizans, and in 1847, the passage into law of the Ten Hours' Bill made it the rule for textile operatives also. Overtime, was, however, still frequently worked in many trades, and the Saturday half-holiday was, of course, yet unknown.

Since that time, Sir R. Giffen computes that the hours of labor have been reduced on an average by 20 per cent., an estimate which seems to me to be rather over the mark. Many people are misled into an optimistic complacency on this point from too exclusive consideration of the textile industries, in which the hours of labor have,

* See *The Eight Hours Day*, by Sidney Webb and Harold Cox (Walter Scott, London, 1891; 1/-).

† See *A general description of all trades, &c.*, London, 1747. Copies in the Guildhall and Patent Office Libraries only; *The Tailoring Trade*, by [F. W. Galton (London; 1896).

‡ See *An Earnest Address and Urgent Appeal to the People of England, on behalf of the oppressed and suffering pitmen of the Counties of Northumberland and Durham*. By W. Scott, Newcastle, 1831.

by the operation of law, been successfully reduced by at least 20 per cent. since 1830. But the beneficent protection of the Factory Acts, especially in the matter of hours, has hitherto been withheld from other workers, and the shortening of the working day has been by no means universal. I have, for instance, no statistics of the hours of railway servants in 1837, but I cannot believe that the directors in that year succeeded in getting any more out of the men they employed than did the directors of, say, the North British Railway Company, in 1889. I have elsewhere given particulars of many cases of men being *regularly* kept on duty for fifteen hours a day,* whilst instances of sixteen or twenty hours' work at a stretch are even now not uncommon. So gross became the scandal that Parliament at last plucked up courage to interfere expressly with the hours of adult men, and the Railways Regulation Act of 1892 empowers the Board of Trade to insist on a reduction of hours. Something has since been done, but the returns compiled by the railway companies themselves, and published annually by the Board of Trade, indicate that the general average among railway workers at the present time is at least twelve hours a day, with a great deal of Sunday labor. The Board of Trade apparently cannot bring itself to enforce an Eight, or even a Ten Hours Day, on the all-powerful railway companies.† Nor do the long hours of railway workers stand alone. The Bradford tramway conductor who, in March, 1891, was found to be working regularly for 115 hours per week, would hardly agree with the optimistic conclusions as to the reduction in the hours of labor. And there are many other classes of workers, such as shop assistants, barmen and barmaids, hospital nurses, blast furnacemen, steelworkers and bakers, whose days' labor normally reaches at least twelve hours. The progress of the nation, and especially the enormous growth of town life, have indeed directly tended, in some occupations, to lengthen the hours of labor. Sixty years ago artificial lighting was neither so good nor so cheap as it has now become, and the day could not so easily be lengthened. In 1837, there were comparatively few theatres or other places of evening entertainment, and, especially in provincial towns, folks stayed in after dark and went to bed early. Abundant gas and cheap plate glass have probably lengthened the hours of shop assistants, just as the increase of evening amusements has lengthened those of barmaids, tramway servants, omnibus men, and cabmen; and even where, as in the case of the engineer, the normal hours of labor have in some places been reduced from sixty to fifty per week, this reduction has been largely neutralized by the prevalent practice of working overtime. It cannot be doubted that the nine hours movement, resting as it does merely on the strength of the Trade Unions, has been robbed of much of its advantage to workmen by this means, and in many trades with nominally restricted hours, every depression of trade produces a lengthening of the hours

* *The Eight Hours Day*. By Sidney Webb and Harold Cox. London: W. Scott; 1891.

† Report of the Select Committee on Railways (Hours of Labor), p. iv. (H.C., 246; May, 1892. Price 2s. 8d.)

actually worked. It is therefore difficult to come to any very optimistic conclusion as to the extent to which the hours of labour have been shortened during the last sixty years. The progress has been very partial, and large masses of workers have still to labor far more hours than is good either for them or the community. It seems evident that if we are really resolved that no worker shall be compelled to spend his whole working life in monotonous toil, we shall have to take more energetic measures than have yet been attempted.

The Housing of the People.

And if we turn from the hours of labor to the workman's dwelling, and enquire what kind of home our civilization affords him, it is equally difficult to give an optimistic answer. It is true that sixty years ago sanitation both for rich and for poor was almost unknown, and that owing to the "Municipal Socialism" of our town councils, the workers have to a large extent shared in the general improvement in this respect. But in the matter of actual room accommodation the statistics of the present day reveal such deplorable shortcomings that one is tempted to declare that things could scarcely ever have been worse. The great crowding into the large towns, which has been so marked a feature of the last sixty years, has gone far to counteract the spasmodic and partial efforts towards better housing. When the Royal Commission on the Housing of the Poor began its labors in 1884, the Commissioners turned first to a veteran philanthropist who had taken part in every movement for social improvement. Their report tells us that: "The first witness who was examined, Lord Shaftesbury, expressed the opinion more than once, as the result of nearly sixty years' experience, that however great the improvement of the condition of the poor in London has been in other respects, *the overcrowding has become more serious than it ever was*. This opinion was corroborated by witnesses who spoke from their own knowledge of its increase in various parts of the town."*

When we consider other parts of the kingdom we find conclusions which are scarcely less appalling. Much has been done in the way of improvement in various parts of Scotland, but 22 per cent. of Scottish families still dwell in a single room each, and the proportion in the case of Glasgow rises to 33 per cent. The little town of Kilmarnock, with only 28,447 inhabitants, huddles even a slightly larger proportion of its families into single-room tenements. Altogether, there are in Glasgow over 120,000, and in all Scotland 560,000 persons (more than one-eighth of the whole population), who do not know the decency of even a two-roomed home.† Compare with this phase of Scottish working-class life the fact

† Census Returns, Scotland, 1891. (C.—6755, 1892).

lately revealed by an elaborate enquiry into the dwelling houses of Boston, Massachusetts, a city of 311,000 inhabitants, where rents are high. The number of families dwelling in single rooms was found to be only 1,053, or less than $1\frac{1}{2}$ per cent., as against Glasgow's 33 per cent.*

Our Scottish record represents indeed some improvement, for in 1861 35 per cent. of the family groups in Scotland lived each in a single room. But the rate of improvement—at no time rapid enough—has actually slackened during the last decade. The total number of single-room families positively increased between 1861 and 1871 by over 4,000; it decreased in the next ten years by 27,000, or 11 per cent.; whilst the last decade has shown a decrease of only 18,000, or less than 9 per cent. At the present rate of progress it will take over a century to remove this disgrace to Scottish civilization.

In England no attempt was made until 1891 to collect statistics relating to the overcrowding of the people in their homes. But the census returns of that year, for the first time, present such statistics, and they show that while the number of one-roomed dwellings is undoubtedly very much smaller in England than in Scotland, yet there is an enormous amount and a very large percentage of "overcrowding" still existing in this kingdom. Out of a total of 6,131,001 separate tenements enumerated in England and Wales in 1891, 286,946, or 4·68 per cent., consisted of one room only, and these contained no fewer than 640,410 persons,† or 2·2 per cent. of the whole population, with the high average of 2·23 persons per room. In London 18·40 per cent. of all the tenements enumerated are one-roomed, and even this high percentage is far distanced by Plymouth, where no less than 24·40 per cent. of all the tenements are similarly one-roomed. Nor do these figures even exhaust the extent of the evils revealed. Even a two or three-roomed tenement may be disgracefully overcrowded. The Census Commissioners, who were left to give their own definition of overcrowding, concluded that "ordinary tenements which have more than two occupants per room, bed-rooms and sitting-rooms included, may safely be considered as unduly overcrowded,"‡ a conclusion with which, considering the small size of the rooms in most of the tenements, few will be found to disagree. Of such homes there were enumerated in England and Wales 481,653, or 7·86 per cent. of the total number of separate tenements enumerated. In these homes lived 3,258,044 persons, or 11·23 per cent. of the total population, with an average of 2·81 persons to each room. The distribution of this great mass of people, officially described as living in "overcrowded" homes, is almost

* Massachusetts Bureau of Statistics of Labor. Report for 1891, p. 567.

† Both the number of single-room tenements and the total number of persons living in them seem much too small to correspond with impressions derived from other sources, and it is probable, as the Census Report admits, that this enumeration is inaccurate. On the other hand, the number of occupants per room of the one-roomed dwellings seems too high to be accurate, remembering the large number of single men and women occupying one-roomed homes.

‡ Census of England and Wales, 1891. Vol. iv. General Report, p. 22. (C.—7222, 1893. Price 1s. 3d.); see also Booth's *Life and Labor of the People*, vols. v. to viii.

entirely confined to the towns (this means that the well-known overcrowding of rural cottages has still to be statistically explored), and it is observed that in some of the coal-bearing districts this crowding is very severe. In the towns the percentage of the population inhabiting these dwellings varies from 40·78 per cent., the highest, in Gateshead, to 1·74 per cent., the lowest, in Portsmouth, London with 19·71 per cent. being about midway. §

Although, therefore, the condition of England presents some improvement upon that of Scotland in this respect, there are yet hundreds of thousands of single room and overcrowded tenements in all our great towns, and the total number of persons in our midst to whom the elementary conditions of decent family life are unknown, exceeds three millions. Here again, although the percentage of the total population is doubtless much less than in 1837, I feel some doubt whether the actual number of those in this condition is very much diminished; and this is a point of supreme importance in our estimate of comparative civilization. It is nearly impossible to get good citizenship, good trade unionism, or good co-operation out of a one-roomed home. Until we can secure to these unfortunates the conditions of elementary decency we can count upon no real progress in their civilization. I will venture to quote, on this point, the unpublished autobiography of Francis Place, the Radical Reformer, of Westminster, whose unique experience included many years of life as a journeyman breeches-maker in a one-roomed home in London, towards the end of last century

"The consequences," he says, "of a man and his wife living in the same room in which the man works is mischievous to them in all respects, and I here add, as a recommendation to all journeymen, tradesmen, and other workmen who are much at home, and even to those who are only at home at meal-times and after working hours, and other times such as Sundays and when they have no employment, to make almost any sacrifice to keep possession of two rooms, however small and however inconveniently situated as regards the place of their employment. Much better is it to be compelled to walk a mile or even two miles to and from their work to a lodging with two rooms, than to live close to their work in a lodging of one room. I advise them also to arrange them contrary to the usual custom of those who have two rooms, and to put the bed in the room in which as much as possible of the domestic work is done. A neat, clean room, though it be as small as a closet, and however few the articles of furniture, is of more importance in its moral consequences than anybody seems hitherto to have supposed. The room in which we now lived was a front room at a baker's shop. The house had three windows in the front, two in the room, and one in a large closet at the end of the room. In this closet I worked. It was a great accommodation to us; it enabled my wife to keep the room in better order; it was advantageous, too, in its moral effects. Attendance on the child was not as it had been always in my presence. I was shut out from seeing the fire lighted, the room washed and

§ For all these statistics relating to overcrowding, etc., see the Census of England and Wales, 1891, General Report, pp. 19-25. (C.—7222, 1893. Price 1s. 3d.).

cleaned, and the clothes washed and ironed, as well as the cooking. We frequently went to bed, as we had but too often been accustomed to do, with a wet or damp floor, and with wet clothes hanging up in the room. Still, a great deal of the annoyance and too close an interference with each other in many disagreeable particulars (which having but one room made inevitable) were removed—happily removed for ever.”*

Conclusion.

Space does not permit me to enlarge further on my theme. Under every heading it might be shown that, whilst the position of a large section of the wage earners has greatly advanced since 1837, other sections have obtained little, if any, share of the general growth in wealth and civilization. If we took each department of life in turn, and fixed a datum line below which we considered that the workman could not decently live, we should find, alike in wages, hours of work, dwelling and general civilization, that the *percentage* of those who fell below the line is less now than it was in 1837. But we should discover also that the lowest level reached was quite as low as at that time, and that the *total number* falling below our assumed datum line is, in actual magnitude, probably greater than in 1837. The depth of the poverty is as great as it can ever have been; its actual breadth even is as great or greater; the residuum of 1837 remains, indeed, undiminished on our hands and our consciences. Under these circumstances, the fact that the more prosperous section has increased and multiplied in numbers and in wealth, whilst leaving so large a part of the community unimproved, appears to me to aggravate our responsibility in the matter. The general moral of the whole survey seems to be the need for more earnest endeavor to “level up” this residuum. The retrospect teaches us that this levelling up is possible. It has actually been accomplished as regards particular industries. The inference is that it could be equally carried out in others did we but really choose to take the appropriate means. And if I had to name one great factor in the continued industrial degradation of large sections of the community who remain in the trough of destitution, I should not hesitate to place first the demoralizing influence of what is called the “sweating system,” or more precisely, home work.† Home work it is, with all its insidious demoralization, that keeps down the earnings of East Loudon, of the down-trodden Sheffield trades, of the miserably paid workers in the Black Country, of women workers everywhere.‡ And it is instructive to notice that, just as in 1837 it was the decaying influence of eighteenth century organization that produced so much of the misery of that time, so in 1897, it is the evil effect of the obsolescent hand industry, with its

* The Autobiography of Francis Place, edited by Graham Wallas—to be published shortly—will throw new light on the social and political history of the century.

† I do not forget the twin social curses of drink and gambling; but these affect individuals in every grade of society. Home work demoralizes whole classes.

‡ See Fabian Tract No. 50, *Sweating: its Cause and Remedy*; and *How best to do away with the Sweating System*, by Mrs. Sidney Webb. Co-operative Union, Manchester; 1892. id.

small masters and isolated home labor, that is perhaps the greatest cause of industrial disorganization. Not until we can thoroughly eradicate the remnants of this system from our midst can we hope to level up its unfortunate victims to the high standard of life which has been given to their more fortunate brethren by the machine industry and the world-commerce.

And if we think seriously of setting to work to lift London to the level of Lancashire, and the Black Country to the standard of Northumberland, the lesson of history is clear. Unregulated individualism it was that produced the "white slavery" of the Lancashire of 1837, and the degraded serfdom of the Northumberland collier. Our fathers dealt with the problem in these cases by replacing this industrial anarchy by the restrictions of well-considered collective control. For the headlong competition which was lengthening the hours and destroying the health and character of the Lancashire mill hand, they substituted the Factory Acts. The heedless greed of the Northumberland coal-owner was checked by successive Mines Regulation Acts. Upon the firm basis of these ever-lengthening codes, strong Trade Unions arose still further to assert the common will. Protected by law and their Trade Union, the coal-hewers and the cotton-spinners were able to combine in yet other ways. Co-operative stores, which had hitherto failed, began to flourish;* town councils stepped in with fresh assertions of Collectivism to raise the standard of sanitation, and to minister to the common needs of urban populations; and finally it was the votes of these comparatively prosperous communities which secured for themselves and their less fortunate brethren that tremendous development of Collectivism, our system of national education. In every department of life where any progress has taken place since 1837, we find that progress marked by an ever-growing substitution of collective rule for individual control. And just where the advance of this collective rule has been checked—in the industries jealously fenced off from effective factory legislation, in the localities from which thorough municipal institutions have been withheld—just there do we find the chief instances in which progress in civilization has been small or even non-existent. Factory legislation, trade unionism, and that combination of consumers for educational or administrative purposes which takes the form either of Municipal Socialism or the Co-operative Store, these, together with the potent engines of taxation and central administrative control, have been the great factors in whatever progress has been made since 1837. Our chief hope for the levelling up of the residuum must lie in the well-devised extension of these manifestations of Collectivism.

SOCIALISM AND THE TEACHING OF CHRIST.

An Address delivered by DR. JOHN CLIFFORD at the Annual Meeting of the Christian Socialist League, at Westbourne Park Chapel, February, 1895.

ONE of the objections frequently brought against the application of the principles of Socialism to our industrial life is that such a process is opposed to the teaching and spirit of the Lord Jesus Christ.

Christianity, it is said, moves in a higher realm than that of humdrum toil, and operates for far higher purposes than those of settling the disputes of capital and labor, adjusting profit and loss, organizing production and distribution, fighting a dangerous plutocracy, and mediating peace between the masses of wage-earners and a narrowing number of wage-payers. It does not "preach a gospel of material blessedness." It ministers to a mind diseased by sin, banishes remorse, and prepares for death and eternity. It is not concerned with this fleeting life ; so brief that "it is like a dewdrop on its perilous way from a tree's summit" ; but with the infinite development of the human spirit through the eternity, and in the home, of God. In support of this eclipse of the life of the present by the stupendous and transcendent greatness of the life of the future revealed in Christianity, the saying of Jesus is quoted. "Work not for the meat that perisheth, but for the meat which abideth unto eternal life, which the Son of Man shall give unto you : for Him the Father, even God, hath sealed."

Hence, many Christians look with misgiving on Churches that venture to study the politico-economical conditions of the life of the people around them, touch with the tips of their fingers the problems for the abolition of poverty, and seek the up-lifting of the wage-earning classes by juster and healthier modes than those of spasmodic charity and unlimited soup. They denounce ministers who hold and teach that the laws of God run everywhere, even into wages and prices, into houses of toil and the sanitary conditions of factories and drapery establishments ; and generally reason that the capacity of the mind for the hospitable entertainment of ideas is so sadly limited that no preacher can be faithful to Christ's message concerning sin and redemption, and at the same time agitate for a "fair living wage," or toil for the reorganization of the industrial life of the country on bases of justice and brotherhood.

Is Socialism Christian?

Professor Flint, a man of vast learning and great ability, has said in one of the largest and least discriminating and most unsatisfactory books I have read on Socialism : " What is called Christian Socialism will always be found either to be unchristian in so far as it is socialistic or unsocialistic in so far as it is truly and fully Christian " * ; and again, " so far as Socialism confines itself to proposals of an exclusively economic and political character, Christianity has no direct concern with it. A Christian may, of course, criticise and disapprove of them ; but it cannot be on Christian grounds ; it must be merely on economic and political grounds. Whether land is to be owned by few or many, by every one or only by the State ; whether industry is to be entirely under the direction of government, or conducted by co-operative associations, or left to private enterprise ; whether labor is to be remunerated by wages or out of profits ; whether wealth is to be equally or unequally distributed, are not in themselves questions of moment to the Christian life, or indeed questions to which Christianity has any answer to give. " † To me that is flat Paganism, and as anti-Christian as it is misleading and delusive.

A still more potent voice speaking from the pontifical chair, Leo. XIII., on what are called " socialistic aberrations," asserts their essential antagonism to the Christian Church ; and the Right Rev. Abbot Snow, O.S.B., goes as far to say : " Socialists are led to abolish religion in order to get rid of its ministers. They (the ministers) are of the governing class, and let them disappear with the rest. Thus the process of general levelling and the abolition of independent authority leads to the negation of religion and formal worship of God, and makes Socialism tend to Atheism. " ‡

It cannot be doubted that these citations tend to the widespread feeling on the part of many leisured and comfortably placed Christians, who have had not only the " promise of the life that now is," but, what is much more, the splendid fulfilment of the promise : that a League like our Christian Socialist League has amongst its first duties to give an account of itself before the tribunal of our Lord and Savior Jesus Christ.

The Social Question.

II.—In doing this let me first of all fully recognize that these objecting Christians and Churches allow that the Christianity of Christ Jesus is not averse to the denunciation of the wrongs of modern society and the exposure of the miseries of our present condition. Indeed, it is eagerly maintained that Christ condemns every manifestation of *individual* selfishness, backs every earnest crusader against *personal* covetousness and greed, and justifies the strongest language we can use against the abuses of *individual*

* *Socialism*. By Professor Robert Flint ; p. 441.

† *Socialism*. By Professor Robert Flint ; p. 452-3.

‡ *The Catholic Times*, August 10, 1894.

competition. All Christians agree in these outbursts of righteous indignation, and rather enjoy seeing the vials of oratorical wrath poured out on the heads of their neighbors; and some of them are beginning to think that after all the "accumulation of gold" is not the highest virtue, and that there is something wrong in that mediæval interpretation of the words of the Master, "The poor ye have with you always," which regards the continuance of poverty as a necessary condition to the exercise of the spasmodic charity of the rich. Many Christians, if not all, at last admit that there is a social question and that they must do something for it, if it is only to talk about it and to denounce somebody or something. They see the poor separated by a great social gulf from the rich, though geographically not far from one another. They lament overcrowding and ask what is the chance for chastity and health, for decency and comfort, to say nothing of happiness under such inhuman conditions. Here in West London—in *West* London—is a house of eight rooms and a small ante-room containing not less than forty-two persons; and it is a sample of the way in which we are violating God's idea of society, and destroying the very germ of social well-being in the extinction of the decencies and wholesomeness of the home.† The awful facts borne in upon us by the gathering masses of unskilled, decrepit, and hopeless laborers, the appalling armies of the unemployed, are forcing Christian men to think and to say "Something must be done." It is not wholly a question of "plenty of room at the top" for the men of tough fibre, clear brain and iron will; but of the "strong bearing the infirmities of the weak," and of brother caring for brother. The bitter separation of class from class, the tyranny of drink, the vice of gambling, the debasement and misery of early marriages, the degradation of women, "the huddling together of thousands of workers, the prey of the sweater"—all these increasing wrongs are, it is confessed, inextricably involved in our vast egoistic industrialism; men, women, and children are caught and crushed in the revolving wheels of this competitive machinery and then flung aside to perish in the workhouse, or to overweight the earlier efforts of their offspring. So that not a few observant souls are ready to accept the strong words of Ruskin and say, "to call the confused wreck of social order and life brought about by malicious collision and competition an arrangement of Providence, is quite one of the most insolent and wicked ways in which it is possible to take the name of God in vain."*

The Sense of Spiritual Brotherhood.

III.—Some of the disciples of Christ will go further and give personal service. A real hearty, loving sympathy carries them to the homes of the poor and suffering, to feed patience, to brighten life, to uphold the afflicted, to sustain the workers in the fierce struggle with toil and want. They believe Christianity bids them

* *Time and Tide*. By John Ruskin; p. 9.

† See Fabian Tract No. 5, *Facts for Socialists*; id.

preach justice, love, and brotherhood. They even plan for co-operative production. They inculcate stewardship and bid men remember that they have to give account of all they have and use to their Father in heaven. To them the social organism is a reality ; and the spiritual brotherhood of men more than a phrase. They have seen God in Christ Jesus, and to them the Incarnation is the revelation of their obligations to their brother man, the widening of the definition of sin so as to include transgressions of the parish and city, of the nation and of humanity. No man lives to himself. Cain is anti-Christ. There is a solidarity of man. The kingdoms of this world are to become *the* kingdom of our God and of His Christ. Law and government are not beyond His policy ; and even our industrial civilization may be shaped according to His will. It is a great change ; and those who have experienced that regeneration of the social consciousness in the Churches of Christ are shaping the future of labor and of the life of the world.

Where Christians Part.

IV.—But it is when we come to a *social policy*, to a *method* or industrial re-arrangement, that the question arises whether we are moving along the lines of Christ's ideas, and are providing *the best industrial body for the incarnation of His spirit*. It is at this third stage we part. Christian men are agreeing more and more—(a) In their antagonism to individual greed and injustice ; (b) in personal and sympathetic devotion to the welfare of the people ; the parting of the ways is (c) as to the real basis on which modern industry shall organize itself. It is when scientific Socialism or Collectivism says—(a) Our industrial life should be based not on individual but on a collective ownership of the chief elements and material instruments of production, (b) that production should be managed not according to the will or caprice or might of private individuals, but collectively, and (c) that the results of toil should be distributed to all who have a share in the toil on the principles of absolute justice, *i.e.*, on the principles of equality in value ;* it is then we are charged with opposing the teaching of the Master.

Now, let there be no mistake as to what this Collectivism is. It does not advocate the absorption of the individual by the State ; or the suppression of the family ; or the total extinction of private property ; or the direction of literature, and art, and religion by the collective wisdom of the community ; it does not involve the sudden overthrow of the machinery of industrial life ; but in the light of the historical development of industry it seeks to accelerate the evolution of the industrial life, so that it shall free itself from the defects and evils that now belong to it, and shall fulfil its Divine mission in the enrichment of the whole life of mankind.† It seeks to build a far better body for the soul of Christ's teaching, and the spirit of His life and death, than this fiercely competitive system, through which He

* *Socialism : its Nature, Strength and Weakness*. By Professor R. T. Ely ; p. 9, *et seq.*

† See Fabian Tract No. 51, *Socialism : True and False* ; id.

now struggles almost in vain to make His voice heard and His power felt.

The Possibility of Collectivism.

V.—I may take it for granted that our present industrial *régime* is not final. Collectivism is at least *possible*. It is often forgotten that the present commercial system is not far advanced. It has scarcely travelled through its earlier and more crude years. There is no fixed necessity for regarding the present conditions of production and distribution of wealth as their final form. The era of Individualism, of syndicates and companies, of capitalists sitting round a green table and directing the movements of hundreds of laborers with no connection with each other except that created by what Carlyle calls the "cash-nexus," may give place to one in which State-industrialism, as seen in our police arrangements, post-office, the civic ownership and control of gas, water, electric lighting, and tramways, Government employment of labor in Woolwich and Portsmouth Dockyards and Enfield factories, enforcement of education, and the payment of teachers for the children of the nation, the provision by the rates of public baths, wash-houses, parks, gardens, art galleries, museums, hospitals, and asylums, will issue in a completely equipped co-operative commonwealth. All these may be. Human nature is confessedly very intractable; but British society may pass by certain stages from the limited Collectivism which now exists to one which covers the whole machinery of the lower part of life, and provides for that physical basis of human existence on which the spiritual structure is being slowly reared.

Mr. Robert Wallace, M.P., tells us in a recent article, "The Collectivist scheme can never be set up." He does not think "the private capitalist will allow himself to be destroyed." No doubt the said capitalist will strenuously resist his extinction, and he may be successful; though that is not very likely, considering the massive strength and tremendous energy of the social forces now at work. But the *practicability* of Collectivism is not our question. We assume that what Mr. Hayes, in his account of the "Great Revolution of 1905" calls "the ideal of common sense," may be "applied to the business transactions of the nation," and that the "very simple organization" of Collectivism may be substituted for the existing chaos of complexity, stupidity, and inefficiency, and utterly hopeless failure to meet even the most elementary requirements of a civilized community.

What Collectivism Would Do.

Asserting, then, that there is nothing in Christianity against the change, and assuming that it is not impracticable, I now seek to prove that the Collectivist arrangement has at least four distinguishing merits, demonstrating its closer and stronger affinities with the teaching of Jesus Christ than the present method of administering the physical life of man—(1) It destroys the occasions of many of the evils of modern society; (2) it advances, elevates, and ennobles the struggle of life; (3) it offers a better environment for

the development of Christ's teaching concerning wealth and brotherhood, and (4) it fosters a higher ideal of human and social worth and well-being. I do not deny all ethical advantage to the individualistic system. I am aware it has developed that prodigious business capacity in a limited and distinguished few of our workers, which secured to Britain thirty years ago the commercial primacy of the globe. It has created the race of merchant princes, traders, and paragons in developing and supplying new material wants. It has found the opportunity for builders of enormous industries in coal and iron, in the production of food and clothing, of machines and news, thereby bringing the produce of the world to our doors and the news of the world to our tables. It has fed legitimate ambitions and saved men from indolence, quickened the sense of responsibility, educated, drilled, and enriched inventive and business faculty.

Not for a moment would we forget these advantages ; but we cannot blind ourselves to the fact that, as a system, it has not stirred the most unselfish desires nor fostered the most generous sympathies on any large scale. It has been egoistic, not altruistic. It is more in keeping with the gladiatorial than the Christian theory of existence. It provides for ruthless self-assertion rather than self-restraint. It does not inspire brotherly helpfulness, but the crushing of competitors and thrusting aside of rivals. Instead of co-operating in the struggle to save and enrich the lives of others, it tends to make its administrators forgetful of their claims, and renders it necessary to bring the power of legislation to the support of children in coal-mines and factories, to the protection and defence of weak women, to the limitation of hours of labor, and the imposition of sanitary conditions of toil. Could any confession be a stronger indictment of individualistic views of labor questions than John Morley's, in his *Life of Richard Cobden*: "Modern statesmanship has definitely decided that unfettered individual competition is not a principle to which the regulation of industry may be entrusted." It is a fact that pure individualism gives every advantage to the strong and renders no aid whatever in bearing the infirmities of the weak. If that is in the least bit in accordance with the mind of Christ, then I must confess that I have failed to read aright its wonderful contents.

On the other hand Collectivism, although it does not change human nature, yet it takes away *the occasion for many of the evils which now afflict society*. It reduces the temptations of life in number and in strength. It means work for every one and the elimination of the idle, and if the work should not be so exacting, responsible, and, therefore, not so educative for a few individuals, yet it will go far to answer Browning's prayer :

O God, make no more giants,
Elevate the race.

Hesiod teaches that "Work is the one road to excellence." "There is no shame in labor ; idleness is shame." An effortless existence is intolerable, and leads to incalculable mischief. Individualism adds to the number of the indolent year by year ; Collectivism sets everybody alike to his share of work, and gives to him his share of reward.

As it is necessary to work, so it is useless to steal. Misrepresentation is not a gain. Grasping avarice is "out of work." Equivocation lacks opportunity. Crimes against property are diminished, and become more and more rare. The degradation of woman ceases in so far as it is due to want. The problem of the "unemployed" is solved. And the possibilities of realizing a nobler type of manly life are increased a thousandfold. Surely all this is in perfect harmony with the teaching and spirit of "Him who came to seek and save that which was lost."

The Elevation of the Struggle for Life.

VI.—Another sign of the closer kinship of Collectivism to the mind of Christ is *in the elevation and nobility it gives to the struggle for life*. Collectivism does not extinguish combat, but it lifts the struggle into the worthiest spheres, reduces it to a minimum in the lower and animal departments, and so leaves man free for the finer toils of intellect and heart; free "to seek first the Kingdom of God and His justice." Benjamin Kidd says, "True Socialism has always one definite object in view, up to which all its proposals directly or indirectly lead. This is the final suspension of that personal struggle for existence which has been waged, not only from the beginning of society, but in one form or another from the beginning of life." But I think that Professor Drummond puts the matter more completely, and therefore more fairly, when he says, "War is simply the modern form of the struggle for life. As the higher qualities become more pronounced and their exercise gives more satisfaction, the struggle passes into more refined forms. One of these is the industrial struggle. Another is the moral struggle. The former of these must give place to the latter. The animal struggle for life must pass away. And under the stimulus of ideals man will continually press upwards, and find his further evolution in forms of moral, social, and spiritual antagonism."

It is a fact "as soon as the first wants are satisfied, the higher wants become imperative." Engrossed in the "things that are on the earth," man cannot seek the things that are above. Chained sixteen hours a day to the car of labor, his life is one of toil and sleep; an animal life almost of necessity. But Collectivism secures leisure for the cultivation of character; man is not so fretted and worn by the exhausting use of his bodily faculties that there is not strength as there is not opportunity for the higher labor of spirit on behalf of the life that is life indeed; but he is as fresh as he is free, and so the displacing of the animal from the throne of existence is at least rendered possible, where now it can only be accomplished, if accomplished at all, in the face of tremendous odds. Labor is thus brought into accord with the Greek idea of the state; and, like it, exists "not for the sake of life, but of a good life." Are not these results in keeping with "the mind of Christ"?

The Ideals of Labor and Brotherhood.

VII.—Again, Collectivism affords a better environment for the teachings of Jesus concerning wealth and the ideals of labor and

brotherhood. If man is, according to Drummond, only "the expression of his environment," if, indeed, he is that in any degree, then it is an unspeakable gain to bring that environment into line with the teaching of Jesus Christ.

In the Gospels, accumulated wealth appears as a grave peril to the spiritual life, a menace to the purest aims and the noblest deeds. Christ is entirely undazzled by its fascinations, and sees in it a threat against the integrity and progress of his kingdom. "Lay not up for yourselves treasures on earth." "Man's life consists not in the abundance of the things he possesses," but in the *use* he makes of what he has—if for himself—still for himself not as an end, but as a means for promoting the well-being of the world. Jesus frowns on the hoarding of wealth. Collectivism renders that accumulation unnecessary and inconvenient. Still, Collectivism does not mean confiscation. It is not robbery. The Bishop of Derry is reported to have said that the spirit of Socialism says: "Here is a man who possesses more than we do; let it be taken from him." Whereas that of Christianity says: "Here is a man who has less than I have; let me give him something." "Socialism" is a vague term, I admit, and probably there is somewhere a "socialism" that speaks the language attributed to it by the Bishop of Derry; but that is not the speech of scientific Socialism or Collectivism. It says, "Here is the great business of industrial life; let us manage it so that all may share in the responsibility and share in the gains, and share fairly and justly as nearly as possible; not one doing all the work and another taking all the gains." It is allowed that individualism in commerce affords abundant opportunity for the use of wealth. It creates means for splendid charities. The millionaire can feed the hungry, clothe the naked, and heal the sick. He can build cathedrals, endow universities, give libraries for study and parks for recreation. And he has done it. Abundant are the witnesses to his wisdom and goodness in distributing his wealth for the welfare of the people, and large is the contribution to the progress of the world due to his thoughtful generosity. But it is some drawback to this consideration that the means for philanthropic work are placed exclusively in the hands of a few; and that the *occasions* for it are due, not only to the vices of men—drunkenness, gambling and the like, but also in a large measure to the political, industrial and social injustices of the reign of individualism. For we must ask: How are these fortunes made? Have any neighbors' landmarks been removed? Is there any grinding of the faces of the poor? Are the workers doomed to harsh and hard conditions of toil? It is notorious that our individualistic commerce is often a tyrant where it should be a servant, and an injustice where it ought to be a help. Here is a picture drawn by Frederic Harrison:—

Ninety per cent. of the actual producers of wealth have no home that they can call their own beyond the end of the week; have no bit of soil, or so much as a room that belongs to them; have nothing of value of any kind, except as much old furniture as will go in a cart; have the precarious chance of weekly wages, which barely suffice to keep them in health; are housed for the most part in places which no man thinks fit for his horse; are separated by so narrow a margin from destitution that a month of

bad trade, sickness or unexpected loss brings them face to face with hunger and pauperism. And below this normal state of the average workman in town and country there is found the great band of destitute outcasts—the camp followers of the army of industry—at least one-tenth of the whole proletarian population, whose normal condition is one of sickening wretchedness. If this is to be the permanent arrangement of modern society civilization must be held to bring a curse on the great majority of mankind.—(Report of Industrial Remuneration Conference, 1886, p. 429.)

Now, though Collectivism does not profess to extinguish vice and manufacture saints, it will abolish poverty, reduce the hungry to an imperceptible quantity, and systematically care for the aged poor and for the sick. It will carry forward much of the charitable work left to the individual initiative, and, like the London County Council, provide recreation grounds, adding the charms of music for adults and gymnasia for the children.† Again, I ask, is not all that in harmony with the spirit and teaching of Him who bids us see Himself in the hungry and sick, the poor and the criminal?

VIII.—Possibly the greatest gain of Collectivism is in its stronger affinity with the high ideals of individual and social life given by Christ Jesus. Collectivism fosters a more Christian conception of industry; one in which every man is a worker, and each worker does not toil for himself exclusively, but for the necessities, comforts, and privileges he shares equally with all the members of the community. He works for what we call “the State,” *i.e.*, for the whole of the people of the city and nation in whose prosperity he has a direct interest and whose business is carried on for the welfare of all his fellows, and thereby for himself; succoring the weaker members, aiding the aged and infirm and reclaiming those who are vicious and criminal, as part of the duty of a collectivist citizen.

It is to the pliant genius of Greece we owe the first effort to reconcile the claims of the State and of the individual. The Greeks were gifted with the power of delicate judgment, of combining principles apparently opposite, of harmonizing conflicting claims; they possessed a sense of measure, a flexibility, a faculty of compromise opposed to the fatal simplicity with which the Eastern politics had been stricken. Not tyranny nor anarchy satisfied the Greek, but “ordered liberty.”* It is that ordered liberty which obtains in and through the collectivist arrangement of human industry, ruling out fierce competitions and methodizing the struggle for the life of others; making the work for bodily living automatic and regular and unexhausting to the last degree; and so securing leisure for the larger life of the mind and heart, of the imagination and of the spirit.

It is notorious that the ideals of individualistic labor are narrow, low-roofed, and self-centred, and men neither have time nor chance to win “their soul,” the Divine portion of their life and of the life of society, the life of noble aims, tender humanities, strong faith and glowing love of God and of men.

It is a new ideal of life and labor that is most urgently needed. England’s present ideal is a creation of hard individualism; and therefore is partial, hollow, unreal and disastrous. But ideals are

* Cf. Professor Butcher, *Some Aspects of the Greek Genius*. (52, *et seq.*)

† See Fabian Tracts Nos. 60, 61, 62, etc.

the main factors in the progress of the home, the parish, and the State. They are the forces that move individuals. Individualism fosters the caste feelings and the caste divisions of society, creates the serfdom of one class and the indolence of another ; makes a large body of submissive, silent, unmanly slaves undergoing grinding toil and continuous anxiety, and a smaller company suffering from debasing indolence and continual weariness ; begets hatred and ill-will on one hand, and scorn and contempt of man on the other. No ! the ideal we need and must have is in the unity of English life, in the recognition that man is complete in the State, at once a member of society and of the Government—" a ruler and yet ruled " ; an ideal that is the *soul* at once of Collectivism and of the revelation of the brotherhood of man in Jesus Christ our Lord, Son of God and Son of man.

Finally, I am sure that as we seek to build up our industries more and more on this basis we shall discover that we need a deep and wide-spread revival of the Spirit of Christ, a clearer insight into His ideas, so that we may suppress the passions that feed our individualistic system and sweep away the accumulated evils which have gathered round it, and at the same time to advance to perfection the Collectivist methods already operative in profit-sharing, in co-operative labor, and in Municipal and State industries. Collectivism will become an argument for a deepened spiritual life. Were we more Christian we should, as did the first Christians, seek with passionate ardor to incarnate a collective rather than an individualistic idea in society. Nothing more forcibly witnesses to the need of Christ than the failure of the Churches to cope with the evils of nineteenth-century life. It is Christ we need. Light both leads and kills. Science has just told us the swiftest and surest foe of the disease-spreading germs is the light. Christ is the light of the world. He shows us the way we should take ; and He also will yet destroy the microbes of physical and moral pestilence and death in our modern industrial life, and render the animal the obedient servant instead of the tyrannical master of the human spirit.

SONGS for SOCIALISTS

A Collection of Eighty-eight Songs

MOST SUITABLE FOR

SUMMER CAMPS AND SCHOOLS, FOR
FÊTES, SOCIAL MEETINGS,
AND "PLACES WHERE THEY SING."

Price Threepence; or 2s. 3d. per dozen.

Published by A. C. FIFIELD for the Fabian
Society, 3 Clement's Inn, Strand, W.C.

THE FABIAN SOCIALIST SERIES.

VOLUMES NOW READY.

I. SOCIALISM AND RELIGION.

CONTENTS: (1) Christian Socialism, by the Rev. Stewart D. Headlam. (2) Socialism and Christianity, by the Rev. Percy Dearmer. (3) Socialism and the Teaching of Christ, by the Rev. John Clifford. (4) A Word of Remembrance and Caution to the Rich, by John Woolman.

II. SOCIALISM AND AGRICULTURE.

CONTENTS: (1) The Village and the Landlord, by Edward Carpenter. (2) State Aid to Agriculture, by T. S. Dymond. (3) The Secret of Rural Depopulation, by Lieut.-Col. D. C. Pedder. (4) The Revival of Agriculture, by the Fabian Society.

III. SOCIALISM AND INDIVIDUALISM.

CONTENTS: (1) The Difficulties of Individualism, by Sidney Webb. (2) The Moral Aspects of Socialism, by Sidney Ball. (3) The Impossibilities of Anarchism, by G. Bernard Shaw. (4) Public Service v. Private Expenditure, by Sir Oliver Lodge.

IV. THE BASIS AND POLICY OF SOCIALISM.

CONTENTS: (1) Facts for Socialists, by the Fabian Society. (2) Capital and Land by the Fabian Society. (3) Socialism: True and False, by Sidney Webb. (4) Twentieth Century Politics, by Sidney Webb.

V. THE COMMONSENSE OF MUNICIPAL TRADING.

By Bernard Shaw. With new Preface. "Whether you agree with it entirely or not, you are bound to admit its intellectual power and persuasive eloquence."

VI. SOCIALISM AND NATIONAL MINIMUM.

By Mrs. Sidney Webb, Miss B. L. Hutchins, and others.

VII. WASTAGE OF CHILD LIFE.

By J. Johnston, M.D. "Passing from one count to another, he puts together his huge indictment of national extravagance; showing also how the practice of thrift might ensure to the nation the possession of healthy and efficient citizens."—*Daily News*.

VIII. SOCIALISM AND SUPERIOR BRAINS: A Reply to Mr. Mallock.

By Bernard Shaw.

IX. THE THEORY AND PRACTICE OF TRADE UNIONISM.

By J. H. Greenwood. Preface by Sidney Webb.

The first four volumes consist of a revised, collected, and classified edition of some of the most valuable of the famous "Fabian Tracts" in a style more suitable for the general reading public. Each booklet is printed on good paper with good type, and is supplied in two forms, viz., in attractive wrappers at 6d. each, net, and in quarter cloth boards, gilt top, at 1/- each, net. Postage: 1d. and 2d. each, except for No. 5, 1jd. and 2d.

THE FABIAN SOCIETY, 3, CLEMENT'S INN, STRAND.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and a complete list of publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.

PUBLISHED APRIL 1907. SECOND EDITION, REVISED, AUGUST 1907.

THE WORKMEN'S COMPENSATION ACT, 1906.

THE WORKMEN'S COMPENSATION ACT, 1906, is the most important law about accidents to workmen. This Tract is written to explain it; if any part is not clear to any reader, or any point is omitted on which he wants information, he can write to the Secretary of the Fabian Society, 3 Clement's Inn, Strand, London, W.C., who will send him an answer free of charge.

The Act of 1906 repeals the Acts of 1897 and 1900, and replaces them by a new, and in many respects better, Act, which applies to accidents happening on and after 1st July, 1907. For accidents before that date the old Acts still apply, except in the matter of medical referees.

The chief changes made by the Act of 1906 are as follows:

The limitation of the old Act to accidents in certain places is swept away. A workman can now obtain compensation for an accident in the course of his employment wherever he is employed. The exclusion from the old Act of accidents which did not happen in or near the employer's premises is, therefore, abolished. But a workman who is injured in a place not under his employer's control while going to or returning from his work, is not within the provisions of the Act.

The new Act applies to all trades and occupations, with certain specified exceptions.

The new Act includes deaths or illness due to certain purely trade diseases, which, not being accidents, were not touched by the old Acts.

Compensation is payable after a week instead of a fortnight, and if disablement lasts for more than a fortnight, it is payable from the date of the accident.

When the accident causes death or serious and permanent disablement, compensation is payable even if the accident is attributed to the serious and wilful misconduct of the workman concerned.

The amount payable to a workman under 21 years of age, and earning less than 20s. a week, may be as much as the full amount of his wages, but not more than 10s. a week, and a year after an accident to any workman under 21, the compensation may be increased to one-half the sum he would probably have been earning, but not exceeding one pound.

The amount of the lump sum payable for permanent disablement is fixed at the amount necessary to purchase a Government annuity of three-quarters of the annual value of the weekly payments.

The rules as to the amount payable in cases where the workman has not been long or regularly employed are made much more definite and reasonable.

Accidents and persons excluded.—Compensation is made payable for any accident to a workman in the course of his employment, if it disables him from earning full wages for more than a week. But—

(1) The old provision remains that a man cannot recover compensation if the accident was due to his serious and wilful misconduct, such as drunkenness or wilful breach of rules, unless the accident causes death or serious and permanent disablement.

(2) It is still only paid for an accident which happens when the workman is doing his proper work. For instance, a ticket collector was killed when talking to a friend in a moving train. His relatives were refused compensation because the accident was not due to the work he was employed to do. But in the case of accidents which injure a workman whilst he is assisting in an emergency by doing something outside his ordinary work (as stopping a runaway horse), compensation can be obtained.

The Act does not apply to :

(1) Persons, not manual workers, receiving a salary exceeding £250 a year.

(2) Any person "whose employment is of a casual nature, and who is employed otherwise than for the purposes of the employer's trade or business." This presumably means such cases as men employed to clean windows, or to do odd jobs about a house, who have no employer other than the person giving them the temporary job.

(3) Outworkers, that is, persons to whom work is given out to be done on premises not under the control or management of the person who gave out the work.

(4) Members of the employer's family, as specified in the Act (Sec. 13).

(5) Policemen, soldiers and naval sailors.

With these exceptions it applies to all employed persons, whether called workmen or clerks, or servants, or anything else ; to women and children as well as men.

Accidents Included.—When a workman is injured or killed by an accident whilst at work, his employer must pay compensation if the workman is prevented from earning full wages for more than a week, or, if he is killed, to those whom he either entirely or partially supported. Compensation is to be paid although the accident is caused by the workman himself or by his fellow workmen. Every accident, however caused, provided its effects last more than a week, comes under the Act, excepting only accidents *not* causing death or serious and permanent disablement, if they are due to the workman's own "serious and wilful misconduct."

It must be remembered that a workman can still, if injured by the negligence of the employer himself, or of a foreman, bring an action under the Employer's Liability Act, 1880, or under the Common Law.

The cases in which a workman will, with some degree of certainty, obtain a larger sum under the old than he will get under the new law, are few. But, if he does bring an action, either under the Act

of 1880, or at Common Law, and the judge who decides the case decides that the employer is only liable under the Compensation Act, the workman must ask the judge to fix the amount which the employer must pay, and so save further costs.

“Contracting Out.”—This is forbidden except under two conditions :—

(i) The employer must not force a workman engaged by him to join any society formed by him. That is to say, if a workman applies for a job the master cannot make it a condition of employment that the workman joins the society or scheme.

(ii) And before any such scheme can exist the employer must submit it to the Chief Registrar of Friendly Societies.

If the Registrar, after consulting the workmen as well as the employer, thinks the men will get as much benefit from it as from the new law, he may grant a certificate. By the new Act he must also ascertain by a ballot that the majority of the men are in favor of the scheme, and he must be satisfied that, if the scheme provides for contributions from the workman, the value of those contributions is returned in benefits over and above the benefits conferred by the Act. Until the certificate is granted no scheme or society formed by an employer is legal. The certificate lasts at least five years ; but if during that time the workmen find that (i) they lose by the scheme, or (ii) they are not fairly treated under it, or (iii) that it is not fully carried out in practice, they may complain to the Registrar. If after enquiry the Registrar thinks the complaint is justified, he may cancel the certificate unless the scheme is made satisfactory and the complaint remedied.

Special Rules for certain Industrial Diseases.—The Act applies to sickness or death due to certain industrial diseases, viz., those due to poisoning by lead, mercury, phosphorus, or arsenic ; to anthrax ; and to ankylostomiasis (the miners' worm) ; and certain other diseases, entirely caused by special occupations, which are given on p. 27. No other diseases come under the Act. The special regulations relating to compensation in such cases are given in Section 8 of the Act, p. 18, and in the Third Schedule, p. 27, which should be carefully read by anyone concerned.

Special Rules for Sailors.—The Act applies to the members of the crew of any ship registered in the United Kingdom, or whose owner resides or has his principal place of business in the United Kingdom. Various special regulations apply to sailors, as that notice of a claim for a death is good if served within six months of the receipt by the claimant of the news of the death ; that notice of an accident and claim for compensation need not be given if the accident happen on shipboard, and otherwise can be served on the master of the ship. Persons concerned should read with care Section 7 of the Act, p. 17.

The Act also applies to pilots, but not to fishermen who are paid by shares in the earnings or the profits of their boat.

How to get Compensation.—The employer has to pay it ; but who is “the employer” ? He is not of necessity the employer by whom the workman is engaged. If an employer undertakes to do a job, and contracts with another employer to do part of that job, the “principal” who has undertaken the whole job must pay for any accident which happens. The new Act gives the workman further rights to claim compensation from the principal employer for an accident happening through any work done by a contractor “in the course of or for the purposes of” the principal’s trade or business. How far these words will be held to go is not yet clear. It may or may not be held that building a station is work for the purposes of the business of a railway company. That is, an injured workman may have a good claim against the railway company as well as the contractor, or he may only have a claim against the contractor. Until the matter has been decided by the judges, a claim should be made against the contractor, if he is a substantial man and able to pay. If he is not so easily able to pay, it would be wise to claim against the principal. It must be remembered that a workman can claim of the contractor in any event. The only point in doubt is exactly in what cases he also has a claim against the principal. This rule does not apply to contractors providing steam engines for use in agriculture, who must always pay for accidents to their men.

Notice of Accident.—In order to claim compensation for an injury, notice of the accident must be given to the employer. If the workman is killed, the notice should be given by one of his family.

The notice must be in writing, and give the following information : (i) Name and address of the injured workman ; (ii) the date of the accident ; (iii) the cause of the injury.

In giving notice, the following rules must be observed : (i) it must be given as soon as possible after the accident ; (ii) and before the injured workman ceases of his own accord to work for the employer ; (iii) only ordinary language is necessary, and the notice need not be in any special form ; (iv) the notice must be accurate, and include all the information already mentioned—if not, the workman may not be able to claim and get compensation.

The notice may be sent either (i) by hand or (ii) by registered letter, to the place of business of the employer, whether the employer is a company, a firm, or a single master ; and if the workman knows where his employers or one of them lives, the notice may be sent to their or his house in the same way.

The following is an example of a notice of accident :

WORKMEN'S COMPENSATION ACT.

To [*name and address of employer*].

Take notice that [*name and address of person injured*] was on the _____ day of _____ 190____, injured by an accident when working for you. The injury was caused by [*shortly state the cause*].

Dated [*the day on which the notice is sent*].

Signed [*either by the man himself or by someone on his behalf*].

Claim for Compensation.—Besides giving notice of an accident as soon as possible after it has occurred, another step has to be taken in order to get compensation. A claim for compensation must be made within six months from the time of the accident. It is not safe to rely on the fact that an employer has actually paid the weekly compensation money. Proof should also be obtained that the employer admits he is liable to pay compensation. The only satisfactory way is to get a written agreement from the employer to that effect, stating the weekly sum the man is entitled to. A memorandum of this agreement should be sent to the Registrar of the County Court of the district where the person entitled to compensation lives. Then the workman's title to compensation is complete, and can be enforced by the officials of the Court.

The above advice as to getting an agreement from the employer and registering it should always be followed when the injuries are serious and likely to last a long time. Where, however, the injuries are not very severe, and complete recovery can be reasonably expected within six months, it may not be worth while to obtain an agreement. But *the claim for compensation must always be sent to the employer* immediately after the injured man has been away from work entirely, or unable to earn full wages, for a week, and when it is certain that he cannot be quite recovered for some weeks. For then, whatever happens, he will always be able to apply in the County Court for compensation if there is any dispute.

It may be useful to give a form of a claim, though no particular form is necessary :

WORKMEN'S COMPENSATION ACT.

To [*name of employer*].

Take notice that [*name and address of person injured*] claims compensation for injuries received while working for you, owing to an accident which took place on the day of , 190 , and of which you have already had notice.

The claim is for per week from the date of the accident until he is recovered.

Dated [*the day on which this notice is sent*].

Signed [*by the workman or someone on his behalf*].

After notice has been given, a dispute may arise as to whether the accident is one for which the employer must pay, or as to the amount of compensation.

Disputed cases are generally settled by a County Court, but if a committee has been formed by the employer and his workmen to settle disputes under the Act, that committee must decide the question. If (i) the committee does not settle the dispute within three months from the day when the claim was made upon the employer, or (ii) the committee thinks it would be best to have the dispute settled by a single person chosen by them, or (iii) either the employer or workman, before the committee meets to settle the dispute, sends a written notice objecting to the committee deciding the question, then, in any of these cases, the dispute must be settled by an arbitrator, appointed by the employer and workman if they can

agree on a suitable person. If they cannot agree, the case must go to the County Court judge, or to an arbitrator appointed by him. If there is no committee formed to settle disputes the workman and employer may agree to appoint an arbitrator. Failing this, they must take the case to the County Court.

An arbitrator, whether appointed by the parties themselves or by the judge, can submit any questions of law which arise to the judge. An appeal from the judge's decision on questions of law can be made to the Court of Appeal direct, unless the employer and workman have agreed to abide by the County Court judge's decision. But on questions of fact, no appeal can be made.

The judge or arbitrator can order either party to pay the costs, which are fixed by the County Court rules.

In deciding disputes under the Act, if the leave of the judge or arbitrator be obtained, a workman may be represented by a member of his family, or "by an officer or member of any society or other body of persons, of which the workman is a member, or with which he is connected." Thus, an officer of his Trade Union can appear for him. But he is not entitled to any fee except travelling expenses. A member of the workman's family, however, may get an allowance for loss of time, the amount being fixed by the judge or arbitrator.

How Much Compensation Must be Paid ?

I.—COMPENSATION FOR DEATH.

The amount of compensation to be paid is not altered by the Act of 1906 : it depends on whether the workman killed leaves (i) relatives who were *wholly* supported and kept by him ; or (ii) relatives who were *partly* kept by him ; or (iii) *no* relatives kept by him.

If a workman leaves dependants whom he entirely supported by his wages, the employer must pay at least £150, but is not liable to pay more than £300. Exactly who dependants are is given clearly and fully in Section 13 of the Act printed on page 21. The new Act includes brothers and sisters, who were excluded before, and also illegitimate children, and the parents of illegitimate children.

If the man had been employed for three years or more, the amount is fixed by finding out the average earnings per week for the three years before the accident. If three years' wages at that average wage per week come to more than £150, the employer must pay a sum equal to them. In other words, the employer must pay 156 times (that is, three years, as there are 52 weeks in the year) the average weekly earnings. But if the workman had not worked for the same employer during the three years before the accident, his average wages per week whilst he had worked for his employer during his last period of continuous employment must be found out. When that is done the amount to be paid is three years' wages at that rate, that is, 156 times his average wages, but his relatives must never get less than £150 or more than £300.

(ii) If the relatives were only partly supported by the workman killed, the highest amount is also £300. But less than £150 may be awarded if the judge, or arbitrator, or committee think a smaller sum will be sufficient compensation.

(iii) If the workman leaves no dependent relatives at his death, the employer must pay reasonable funeral expenses, but they must not be more than £10.

Any dispute as to who is a dependant, or as to the amount to be paid to each dependant, is to be settled by arbitration.

II.—COMPENSATION FOR INJURY.

When the accident does not kill the workman, compensation can only be got if the workman is unable to earn full wages for more than a week. At the end of the week he may be entirely unable to work, or he may, though unable to earn full wages, be able to do some work. In either case he is entitled to be paid a weekly sum by the employer until he has completely recovered. The amount depends on the weekly amount he was earning at the time of the accident. When a man is entirely unable to work, if he has been employed by the master for a year, the sum to be paid is as a rule half the average weekly wages earned by him during that period.

If he has not been employed by the master for twelve months, the amount payable is half the average weekly wages earned by him whilst he has been employed by the employer. But it is provided (1st Schedule, 2, p. 23) that "average weekly earnings shall be computed in such manner as is best calculated to give the rate per week at which the workman was being remunerated. Provided that where by the shortness of time during which the workman has been in the employment of his employer (or for other reasons) it is impracticable at the date of the accident to compute the rate of remuneration, regard may be had" to the current rate of wages earned by his shop-mates or in the district. The new Act appears to direct that the rate of compensation should be fixed according to what the workman would have earned in ordinary course, and not (as before) by any hard and fast rule of earnings actually received by the man himself. On the other hand, certain allowances for special expenses previously reckoned as earnings are no longer to be included in calculating compensation.

No doctor's expenses or any other sums whatever are payable under the Act for an injury except:—

(1) Weekly compensation.

(2) A lump sum in place of weekly compensation, if the employer prefers this way of settlement six months after the accident.

When the injured workman is not entirely prevented from working after the accident, he is still entitled to a weekly sum if he cannot earn full wages. This sum cannot be more than half his weekly wages before the accident, or more than the difference between his new and his old wages.

If the inability to work lasts less than a fortnight, no compensation is payable for the first week ; but if it lasts over a fortnight, compensation is payable from the date of the accident.

By the new Act weekly payments for total incapacity of a workman who is under 21 years of age at the date of the injury and earning then less than £1 a week may be any sum not exceeding either his full wages or 10s. a week.

The cases where a man, though not entirely disabled from working after an accident, yet is unable to earn the same wages as before, require some consideration. They are chiefly cases of small but permanent injuries, as, for example, the loss of a finger or an eye. Such injuries, comparatively simple from a medical point of view, render the workman less efficient—often to a very serious extent. In fact, a return to the same sort of work is sometimes impossible, and thus a skilled man may have to go back to less skilled work, and, consequently, earn less wages. In such cases, therefore, compensation must be obtained at once. It is not enough that the employer continues to employ the man at the same wages as before, though really unable to do the same work. For, in such a case, if no claim is made within the six months, the workman could be dismissed at any time, and on seeking employment elsewhere, would earn less wages, and yet be unable to obtain compensation. In many cases, so long as the employer were alive, the man would be safe enough. But if the employer died, the workman would be without any security against the successors in the business. The proper course to take is to obtain a declaration that the employer is liable, and register it in the County Court. Then, even though the man is kept on at the same wages, he is in a position, when dismissed or on leaving his employment, to apply in the County Court to have the amount of compensation fixed.

The Doctor's Report.—The question remains, who is to say whether the workman can or cannot go to work ?

Any workman receiving weekly payments must allow himself to be examined by a doctor appointed and paid by the employer, subject to the rules as to frequency of visits set out in official regulations ; and if the workman refuses, his right to compensation is suspended. If he objects to the report of the master's doctor, or if the master objects to a report made by a doctor employed by the workman (which must in each case be sent to the other party within six days of the examination), and no agreement is arrived at as to the workman's condition or fitness for employment, the Registrar of the County Court may, on the application of both parties, refer the matter to a medical referee, whose fee, not exceeding £1, must be paid by the applicants, and whose decision will be final. The above rules also apply to a dispute as to whether a workman's incapacity to work is due wholly or in part to an accident. Refusal to submit to examination by the referee entails loss for the time of all rights under the Act.

A Lump Sum.—When a weekly payment has been made for six months, the employer may pay a lump sum in full settlement of future weekly payments. The amount of the sum must be fixed by the Court or the arbitrator, unless it is settled by agreement. But if the incapacity is permanent, the lump sum must be enough to purchase a Government life annuity for the workman of three quarters of the annual value of the weekly compensation, unless some other sum is agreed upon by both parties.

Alterations in Amount of Compensation.

But at any time while a workman is getting a weekly payment because of the accident preventing him from earning full wages, or from working at all, the workman or employer may want it to be altered. The workman may find that his accident was more serious than he thought, and that he cannot earn as much as he thought he could. The employer may wish to pay less, or to stop the weekly payment altogether, because the workman is better in health and can earn more than was expected. In either case, unless they can agree, the question must be settled by the Court or by arbitration. The workman in such a case should see that his payment is not stopped altogether. If he is still suffering in the least degree from the effects of the accident, he is entitled to an order for at any rate 1d. a week. This keeps his right alive ; and later, if necessary, he can get the 1d. a week increased. If the accident happens to a workman under 21 years of age, he may at any review of the award which is made more than a year after the accident, receive as much as half what he *would have then been earning* but for the accident, provided that £1 a week is the highest compensation payable.

Memorandum of the Amount of Compensation Obtained.

When an accident has happened, and the amount of compensation has been fixed, either by agreement, or the committee, or the County Court judge, or the arbitrator, a memorandum must be sent to the Registrar of the County Court for the district in which the person getting compensation lives. It must contain the decision or agreement arrived at, and will be entered in a special register without any fee. When registered, the memorandum can be enforced like a County Court judgment, that is, by execution against the goods of the person liable. It must be signed by the arbitrator, or by the chairman and secretary of the committee, or by both parties, according as the case was decided. If not thus registered it cannot be so easily enforced. Other rules as to this memorandum and the conditions under which it can be altered by the judge, if for example, the workman has been persuaded to agree to accept less than is fairly due, will be found in Schedule II. 9, page 26.

Other Regulations.

The money payable on the death of a workman will be paid into the County Court, and will be by the Court applied for the

benefit of the relatives who were dependent on him. If he has no dependants, it may be paid to his legal representatives or to those to whom payment for medical attendance and burial is due.

The committee or arbitrator, when they find that an employer must pay compensation, may order the money to be invested in the Post Office Savings Bank. It would then be entered in the name of the Registrar of the County Court within whose district the deceased workman lived.

The money may be invested in the purchase of an annuity from the National Debt Commissioners ; or it may be paid into the Post Office Savings Bank, although the sum is larger than the amount usually allowed in the Bank.

When the money is invested in the Post Office Savings Bank, it cannot be paid out unless the County Court judge or the Treasury sign a form authorizing it to be paid out.

Although a person who is entitled to money paid as compensation has already an account at the Savings Bank, another account may be opened in order to pay in the compensation money.

If an employer dies before a workman has obtained compensation, his executors or administrators must pay it out of his estate.

In case the employer becomes bankrupt before payment of the compensation awarded, and has insured himself against the Act, the insurers must pay the amount to the workman or his relatives.

This applies also where the employer makes any arrangement with his creditors, and to a company which is being wound up. For other provisions on this subject see section 5 of the Act, page 16.

The weekly payment awarded to an injured workman, or a lump sum paid instead of a weekly payment (after six months) cannot be taken for debts.

The rules as to payment to a workman who has left the United Kingdom will be found in Schedule I. 18.

There are two other older laws, still in force, by which an injured workman can sometimes recover damages.

The Old "Common Law."

By Common Law a workman injured by an accident when working can bring an action against his master—

(i) if the master employed a servant, knowing that the servant was incompetent to do the work ; or

(ii) if a master used bad machinery or plant which he knew was unsafe and dangerous.

But if the master proved (i), that the workman knew the machinery or plant was unsafe, or (ii) that the workman was partly to blame for the accident, the workman could not win his action.

Employers' Liability Act, 1880.

This Act makes an employer liable to pay damages to a workman if he be injured, or to his relatives if he be killed—

- (i) by some defect in the machinery or plant which ought to have been put right by the master or his foreman ;
- (ii) by the carelessness of a foreman ;
- (iii) through obeying an order which caused the injury ;
- (iv) through a fellow workman obeying a rule or order of his master, or
- (v) by the carelessness of a man in charge of any engine, points, or signal on a railway.

But the master can escape liability by proving that the workman injured knew the danger of the bad machinery, or was partly to blame for the accident, or that the accident was caused by a fellow workman.

When to Choose the Employers' Liability Act.

The Employers' Liability Act applies to manual laborers only, whereas the Compensation Act applies to all persons.

An action under the Employers' Liability Act, 1880, can only be maintained :

- (i) If the workman is engaged in manual labor at an employment to which the Act applies ;
- (ii) If the workman is injured or killed in any of the five ways just mentioned ;
- (iii) If notice has been given within six weeks of the accident, and an action has been commenced within six months. In cases of death an interval of a year from the death is permitted.

As the workman or his relatives will be certain of some compensation under the Compensation Act, actions under the Act of 1880 should be avoided except in cases of very serious injuries and very clear liability of the employer. The reasons for this are—

- (i) The difficulty of getting workmen to give evidence against their employer is great ;
- (ii) The expenses are considerable, as the costs of the employer may have to be paid by the workman if he loses his case ;
- (iii) The amount of the damages which the judge or jury will award is uncertain.

But as the highest amount of compensation which a workman's relatives can get under the Compensation Act is only £300—and this is only where they were entirely kept by the workman killed—it may sometimes be well to claim under the Act of 1880.

It will be remembered that although the case should be lost, yet if the judge finds that the employer is liable to pay compensation under the Act of 1906, he may fix the amount to be paid. He can only do so when asked by the injured person or his relatives, who should, to save further trouble and expense, always ask for it. The expenses of the employer, or part of them, may have to be paid by the relatives if their case is not successful.

In what cases ought such an action to be started ?

Now, £300, the highest amount of compensation under the Act of 1906, means that the workman was earning on the average £2 a week at the time of his death. The highest amount under the Act of 1880 is three years' average wages of a worker in the same trade, grade, and district, as the worker killed. Therefore, an action under the Act of 1880 should only be started if the workman's wages were at least £2 10s. a week ; and even then, as the full amount of three years' wages, viz., £390, may not be obtained, it is only when the employer or his foreman is clearly and seriously to blame, that the expense and uncertainty of such an action should be risked.

Where the workman is injured he can, under the Compensation Act, only get at most a weekly amount of £1. This is liable to alteration, and after six months the employer may pay a lump sum instead of continuing the weekly payment. Now, £1 a week is only to be paid if the injured workman's wages are at least £2. It may, therefore, be said that actions under the Act of 1880 for injuries should only be started—

- (i) if the workman's wages were at least £2 10s. a week ;
- (ii) if the action is almost certain to be successful because of the employer or his foreman being clearly and seriously to blame ; and
- (iii) if the workman's injuries are very serious and likely to continue for some considerable period or for life.

General Advice.

The Trade Union secretary and members of a workman's family may appear at an arbitration under the Act, as has been mentioned on page 7. They should, therefore, obtain the names and addresses, at least, of those present at an accident. If those persons would write down a short account of what they recollect of the matter it would be very valuable in the event of subsequent proceedings, whether under the Compensation Act or otherwise.

In cases of permanent injury, such as the loss of an eye, or a hand or leg, where compensation will be required for life, it will generally be wise to employ a solicitor.

TEXT OF THE WORKMEN'S COMPENSATION ACT, 1906.

1.—*Liability of employers to workmen for injuries.* (1) If in any employment personal injury by accident arising out of and in the course of the employment is caused to a workman, his employer shall, subject as hereinafter mentioned, be liable to pay compensation in accordance with the First Schedule to this Act.

(2) Provided that—

(a) The employer shall not be liable under this Act in respect of any injury which does not disable the workman for a period of at least one week from earning full wages at the work at which he was employed :

(b) When the injury was caused by the personal negligence or wilful act of the employer or of some person for whose act or default the employer is responsible, nothing in this Act shall affect any civil liability of the employer, but in that case the workman may, at his option, either claim compensation under this Act or take proceedings independently of this Act ; but the employer shall not be liable to pay compensation for injury to a workman by accident arising out of and in the course of the employment both independently of and also under this Act, and shall not be liable to any proceedings independently of this Act, except in case of such personal negligence or wilful act as aforesaid :

(c) If it is proved that the injury to a workman is attributable to the serious and wilful misconduct of that workman, any compensation claimed in respect of that injury shall, unless the injury results in death or serious and permanent disablement, be disallowed.

(3) If any question arises in any proceedings under this Act as to the liability to pay compensation under this Act (including any question as to whether the person injured is a workman to whom this Act applies), or as to the amount or duration of compensation under this Act, the question, if not settled by agreement, shall, subject to the provisions of the First Schedule to this Act, be settled by arbitration, in accordance with the Second Schedule to this Act.

(4) If, within the time hereinafter in this Act limited for taking proceedings, an action is brought to recover damages independently of this Act for injury caused by any accident, and it is determined in such action that the injury is one for which the employer is not liable in such action, but that he would have been liable to pay compensation under the provisions of this Act, the action shall be dismissed ; but the court in which the action is tried shall, if the plaintiff so choose, proceed to assess such compensation, but may deduct from such compensation all or part of the costs which in its judgment have been caused by the plaintiff bringing the action instead of proceeding under this Act. In any proceeding under this sub-section, when the court assesses the compensation it shall give a certificate of the compensation it has awarded and the directions it has given as to the deduction for costs, and such certificate shall have the force and effect of an award under this Act.

(5) Nothing in this Act shall affect any proceeding for a fine under the enactments relating to mines, factories, or workshops, or the application of any such fine.

2.—*Time for taking proceedings.* (1) Proceedings for the recovery under this Act of compensation for an injury shall not be maintainable unless notice of the accident has been given as soon as practicable after the happening thereof and before the workman has voluntarily left the employment in which he was injured, and unless the claim for compensation with respect to such accident has been made within six months from the occurrence of the accident causing the injury, or, in case of death, within six months from the time of death :

Provided always that—

- (a) The want of or any defect or inaccuracy in such notice shall not be a bar to the maintenance of such proceedings if it is found in the proceedings for settling the claim that the employer is not, or would not, if a notice or an amended notice were then given and the hearing postponed, be prejudiced in his defence by the want, defect, or inaccuracy, or that such want, defect, or inaccuracy was occasioned by mistake, absence from the United Kingdom, or other reasonable cause; and
- (b) The failure to make a claim within the period above specified shall not be a bar to the maintenance of such proceedings if it is found that the failure was occasioned by mistake, absence from the United Kingdom, or other reasonable cause.

(2) Notice in respect of an injury under this Act shall give the name and address of the person injured, and shall state in ordinary language the cause of the injury and the date at which the accident happened, and shall be served on the employer, or, if there is more than one employer, upon one of such employers.

(3) The notice may be served by delivering the same at, or sending it by post in a registered letter addressed to, the residence or place of business of the person on whom it is to be served.

(4) Where the employer is a body of persons, corporate or unincorporate, the notice may also be served by delivering the same at, or by sending it by post in a registered letter addressed to, the employer at the office, or, if there be more than one office, any one of the offices of such body.

3.—Contracting out. (1) If the Registrar of Friendly Societies, after taking steps to ascertain the views of the employer and workmen, certifies that any scheme of compensation, benefit or insurance for the workmen of an employer in any employment, whether or not such scheme includes other employers and their workmen, provides scales of compensation not less favourable to the workmen and their dependants than the corresponding scales contained in this Act, and that, where the scheme provides for contributions by the workmen, the scheme confers benefits at least equivalent to those contributions, in addition to the benefits to which the workmen would have been entitled under this Act, and that a majority (to be ascertained by ballot) of the workmen to whom the scheme is applicable are in favour of such scheme, the employer may, whilst the certificate is in force, contract with any of his workmen that the provisions of the scheme shall be substituted for the provisions of this Act, and thereupon the employer shall be liable only in accordance with the scheme, but, save as aforesaid, this Act shall apply notwithstanding any contract to the contrary made after the commencement of this Act.

(2) The Registrar may give a certificate to expire at the end of a limited period of not less than five years, and may from time to time renew with or without modifications such a certificate to expire at the end of the period for which it is renewed.

(3) No scheme shall be so certified which contains an obligation upon the workmen to join the scheme as a condition of their hiring, or which does not contain provisions enabling a workman to withdraw from the scheme.

(4) If complaint is made to the Registrar of Friendly Societies by or on behalf of the workmen of any employer that the benefits conferred by any scheme no longer conform to the conditions stated in sub-section (1) of this section, or that the provisions of such scheme are being violated, or that the scheme is not being fairly administered, or that satisfactory reasons exist for revoking the certificate, the Registrar shall examine into the complaint, and, if satisfied that good cause exist for such complaint, shall, unless the cause of complaint is removed, revoke the certificate.

(5) When a certificate is revoked or expires, any moneys or securities held for the purpose of the scheme shall, after due provision has been made to discharge the liabilities already accrued, be distributed as may be arranged between the employer and workmen, or as may be determined by the Registrar of Friendly Societies in the event of a difference of opinion.

(6) Whenever a scheme has been certified as aforesaid, it shall be the duty of the employer to answer all such inquiries and to furnish all such accounts in regard to the scheme as may be made or required by the Registrar of Friendly Societies.

(7) The Chief Registrar of Friendly Societies shall include in his annual report the particulars of the proceedings of the Registrar under this Act.

(8) The Chief Registrar of Friendly Societies may make regulations for the purpose of carrying this section into effect.

4.—Sub-contracting. (1) Where any person (in this section referred to as the principal), in the course of or for the purposes of his trade or business, contracts with any other person (in this section referred to as the contractor) for the execution by or under the contractor of the whole or any part of any work undertaken by the principal, the principal shall be liable to pay to any workman employed in the execution of the work any compensation under this Act which he would have been liable to pay if that workman had been immediately employed by him; and where compensation is claimed from or proceedings are taken against the principal, then, in the application of this Act, references to the principal shall be substituted for references to the employer, except that the amount of compensation shall be calculated with reference to the earnings of the workman under the employer by whom he is immediately employed:

Provided that, where the contract relates to threshing, ploughing, or other agricultural work, and the contractor provides and uses machinery driven by mechanical power for the purpose of such work, he and he alone shall be liable under this Act to pay compensation to any workman employed by him on such work.

(2) Where the principal is liable to pay compensation under this section, he shall be entitled to be indemnified by any person who would have been liable to pay compensation to the workman independently of this section, and all questions as to the right to and amount of any such indemnity shall in default of agreement be settled by arbitration under this Act.

(3) Nothing in this section shall be construed as preventing a workman recovering compensation under this Act from the contractor instead of the principal.

(4) This section shall not apply in any case where the accident occurred elsewhere than on, or in, or about premises on which the principal has undertaken to execute the work or which are otherwise under his control or management.

5.—Provision as to cases of bankruptcy of employer. (1) Where any employer has entered into a contract with any insurers in respect of any liability under this Act to any workman, then, in the event of the employer becoming bankrupt, or making a composition or arrangement with his creditors, or if the employer is a company in the event of the company having commenced to be wound up, the rights of the employer against the insurers as respects that liability shall, notwithstanding anything in the enactments relating to bankruptcy and the winding up of companies, be transferred to and vest in the workman, and upon any such transfer the insurers shall have the same rights and remedies and be subject to the same liabilities as if they were the employer, so however that the insurers shall not be under any greater liability to the workman than they would have been under to the employer.

(2) If the liability of the insurers to the workman is less than the liability of the employer to the workman, the workman may prove for the balance in the bankruptcy or liquidation.

(3) There shall be included among the debts which under section one of the Preferential Payments in Bankruptcy Act, 1888, and section four of the Preferential Payments in Bankruptcy (Ireland) Act, 1889, are in the distribution of the property of a bankrupt and in the distribution of the assets of a company being wound up to be paid in priority to all other debts, the amount, not exceeding in any individual case one hundred pounds, due in respect of any compensation the liability whereof accrued before the date of the receiving order or the date of the commencement of the winding up, and those Acts and the Preferential Payments in Bankruptcy Amendment Act, 1897, shall have effect accordingly. Where the compensation is a weekly payment, the amount due in respect thereof shall, for the purposes of this provision, be taken to be the amount of the lump sum for which the weekly payment could, if redeemable, be redeemed if the employer made an application for that purpose under the First Schedule to this Act.

(4) In the case of the winding up of a company within the meaning of the Stan-
dard Companies Act, 1887, such an amount as aforesaid, if the compensation is payable to a

miner or the dependants of a miner, shall have the like priority as is conferred on wages of miners by section nine of that Act, and that section shall have effect accordingly.

(5) The provisions of this section with respect to preferences and priorities shall not apply where the bankrupt or the company being wound up has entered into such a contract with insurers as aforesaid.

(6) This section shall not apply where a company is wound up voluntarily merely for the purposes of reconstruction or of amalgamation with another company.

6.—*Remedies both against employer and stranger.* Where the injury for which compensation is payable under this Act was caused under circumstances creating a legal liability in some person other than the employer to pay damages in respect thereof—

- (1) The workman may take proceedings both against that person to recover damages and against any person liable to pay compensation under this Act for such compensation, but shall not be entitled to recover both damages and compensation; and
- (2) If the workman has recovered compensation under this Act, the person by whom the compensation was paid, and any person who has been called on to pay an indemnity under the section of this Act relating to sub-contracting, shall be entitled to be indemnified by the person so liable to pay damages as aforesaid, and all questions as to the right to and amount of any such indemnity shall, in default of agreement, be settled by action, or, by consent of the parties, by arbitration under this Act.

7.—*Application of Act to seamen.* (1) This Act shall apply to masters, seamen, and apprentices to the sea service and apprentices in the sea-fishing service, provided that such persons are workmen within the meaning of this Act, and are members of the crew of any ship registered in the United Kingdom, or of any other British ship or vessel of which the owner, or (if there is more than one owner) the managing owner, or manager resides or has his principal place of business in the United Kingdom, subject to the following modifications:—

- (a) The notice of accident and the claim for compensation may, except where the person injured is the master, be served on the master of the ship as if he were the employer, but where the accident happened and the incapacity commenced on board the ship it shall not be necessary to give any notice of the accident:
- (b) In the case of the death of the master, seaman, or apprentice, the claim for compensation shall be made within six months after news of the death has been received by the claimant:
- (c) Where an injured master, seaman, or apprentice is discharged or left behind in a British possession or in a foreign country, depositions respecting the circumstances and nature of the injury may be taken by any judge or magistrate in the British possession, and by any British consular officer in the foreign country, and if so taken shall be transmitted by the person by whom they are taken to the Board of Trade, and such depositions or certified copies thereof shall in any proceedings for enforcing the claim be admissible in evidence as provided by sections six hundred and ninety-one and six hundred and ninety-five of the Merchant Shipping Act, 1894, and those sections shall apply accordingly.
- (d) In the case of the death of a master, seaman, or apprentice, leaving no dependants, no compensation shall be payable, if the owner of the ship is under the Merchant Shipping Act, 1894, liable to pay the expenses of burial:
- (e) The weekly payment shall not be payable in respect of the period during which the owner of the ship is, under the Merchant Shipping Act, 1894, as amended by any subsequent enactment, or otherwise, liable to defray the expenses of maintenance of the injured master, seaman, or apprentice.

(f) Any sum payable by way of compensation by the owner of a ship under this Act shall be paid in full notwithstanding anything in section five hundred and three of the Merchant Shipping Act, 1894 (which relates to the limitation of a shipowner's liability in certain cases of loss of life, injury, or damage), but the limitation on the owner's liability imposed by that section shall apply to the amount recoverable by way of indemnity under the section of this Act relating to remedies both against employer and stranger as if the indemnity were damages for loss of life or personal injury :

(g) Subsections (2) and (3) of section one hundred and seventy-four of the Merchant Shipping Act, 1894 (which relates to the recovery of wages of seamen lost with their ship), shall apply as respects proceedings for the recovery of compensation by dependants of masters, seamen, and apprentices lost with their ship as they apply with respect to proceedings for the recovery of wages due to seamen and apprentices ; and proceedings for the recovery of compensation shall in such a case be maintainable if the claim is made within eighteen months of the date at which the ship is deemed to have been lost with all hands :

(2) This Act shall not apply to such members of the crew of a fishing vessel as are remunerated by shares in the profits or the gross earnings of the working of such vessel.

(3) This section shall extend to pilots to whom Part X. of the Merchant Shipping Act, 1894, applies, as if a pilot when employed on any such ship as aforesaid were a seaman and a member of the crew.

8.—Application of Act to industrial diseases. (1) Where—

- (i) the certifying surgeon appointed under the Factory and Workshop Act, 1901, for the district in which a workman is employed certifies that the workman is suffering from a disease mentioned in the Third Schedule to this Act and is thereby disabled from earning full wages at the work at which he was employed ; or
- (ii) a workman is, in pursuance of any special rules or regulations made under the Factory and Workshop Act, 1901, suspended from his usual employment on account of having contracted any such disease ; or
- (iii) the death of a workman is caused by any such disease ;

and the disease is due to the nature of any employment in which the workman was employed at any time within the twelve months previous to the date of the disablement or suspension, whether under one or more employers, he or his dependants shall be entitled to compensation under this Act as if the disease or such suspension as aforesaid were a personal injury by accident arising out of and in the course of that employment, subject to the following modifications :—

- (a) The disablement or suspension shall be treated as the happening of the accident ;
- (b) If it is proved that the workman has at the time of entering the employment wilfully and falsely represented himself in writing as not having previously suffered from the disease, compensation shall not be payable ;
- (c) The compensation shall be recoverable from the employer who last employed the workman during the said twelve months in the employment to the nature of which the disease was due :

Provided that—

(1) the workman or his dependants if so required shall furnish that employer with such information as to the names and addresses of all the other employers who employed him in the employment during the said twelve months as he or they may possess, and, if such information is not furnished, or is not sufficient to enable that employer to take proceedings under the next following proviso, that employer upon proving that the disease was not contracted whilst the workman was in his employment shall not be liable to pay compensation ; and

(ii) if that employer alleges that the disease was in fact contracted whilst the workman was in the employment of some other employer, and not whilst in his employment, he may join such other employer as a party to the arbitration, and if the allegation is proved that other employer shall be the employer from whom the compensation is to be recoverable ; and

(iii) if the disease is of such a nature as to be contracted by a gradual process, any other employers who during the said twelve months employed the workman in the employment to the nature of which the disease was due shall be liable to make to the employer from whom compensation is recoverable such contributions as, in default of agreement, may be determined in the arbitration under this Act for settling the amount of the compensation ;

- (d) The amount of the compensation shall be calculated with reference to the earnings of the workman under the employer from whom the compensation is recoverable ;
- (e) The employer to whom notice of the death, disablement, or suspension is to be given shall be the employer who last employed the workman during the said twelve months in the employment to the nature of which the disease was due, and the notice may be given notwithstanding that the workman has voluntarily left his employment.
- (f) If an employer or a workman is aggrieved by the action of a certifying or other surgeon in giving or refusing to give a certificate of disablement or in suspending or refusing to suspend a workman for the purposes of this section, the matter shall in accordance with regulations made by the Secretary of State be referred to a medical referee, whose decision shall be final.

(2) If the workman at or immediately before the date of the disablement or suspension was employed in any process mentioned in the second column of the Third Schedule to this Act, and the disease contracted is the disease in the first column of that Schedule set opposite the description of the process, the disease, except where the certifying surgeon certifies that in his opinion the disease was not due to the nature of the employment, shall be deemed to have been due to the nature of that employment, unless the employer proves the contrary.

(3) The Secretary of State may make rules regulating the duties and fees of certifying and other surgeons (including dentists) under this section.

(4) For the purposes of this section the date of disablement shall be such date as the certifying surgeon certifies as the date on which the disablement commenced, or, if he is unable to certify such a date, the date on which the certificate is given : Provided that—

- (a) Where the medical referee allows an appeal against a refusal by a certifying surgeon to give a certificate of disablement, the date of disablement shall be such date as the medical referee may determine :
- (b) Where a workman dies without having obtained a certificate of disablement, or is at the time of death not in receipt of a weekly payment on account of disablement, it shall be the date of death.

(5) In such cases, and subject to such conditions as the Secretary of State may direct, a medical practitioner appointed by the Secretary of State for the purpose shall have the powers and duties of a certifying surgeon under this section, and this section shall be construed accordingly.

(6) The Secretary of State may make orders for extending the provisions of this section to other diseases and other processes, and to injuries due to the nature of any employment specified in the order not being injuries by accident, either without modification or subject to such modifications as may be contained in the order.

(7) Where, after inquiry held on the application of any employers or workmen engaged in any industry to which this section applies, it appears that a mutual trade insurance company or society for insuring against the risks under this section has been established for the industry, and that a majority of the employers engaged in that

industry are insured against such risks in the company or society and that the company or society consents, the Secretary of State may, by Provisional Order, require all employers in that industry to insure in the company or society upon such terms and under such conditions and subject to such exceptions as may be set forth in the Order. Where such a company or society has been established, but is confined to employers in any particular locality or of any particular class, the Secretary of State may for the purposes of this provision treat the industry, as carried on by employers in that locality or of that class, as a separate industry.

(8) A Provisional Order made under this section shall be of no force whatever unless and until it is confirmed by Parliament, and if, while the Bill confirming any such Order is pending in either House of Parliament, a petition is presented against the Order, the Bill may be referred to a Select Committee, and the petitioner shall be allowed to appear and oppose as in the case of Private Bills, and any Act confirming any Provisional Order under this section may be repealed, altered, or amended by a Provisional Order made and confirmed in like manner.

(9) Any expenses incurred by the Secretary of State in respect of any such Order, Provisional Order, or confirming Bill shall be defrayed out of moneys provided by Parliament.

(10) Nothing in this section shall affect the rights of a workman to recover compensation in respect of a disease to which this section does not apply, if the disease is a personal injury by accident within the meaning of this Act.

9.—*Application to workmen in employment of Crown.* (1) This Act shall not apply to persons in the naval or military service of the Crown, but otherwise shall apply to workmen employed by or under the Crown to whom this Act would apply if the employer were a private person :

Provided that in the case of a person employed in the private service of the Crown, the head of that department of the Royal Household in which he was employed at the time of the accident shall be deemed to be his employer.

(2) The Treasury may, by warrant laid before Parliament, modify for the purposes of this Act their warrant made under section one of the Superannuation Act, 1887, and notwithstanding anything in that Act, or any such warrant, may frame schemes with a view to their being certified by the Registrar of Friendly Societies under this Act.

10.—*Appointment and remuneration of medical referees and arbitrators.* (1) The Secretary of State may appoint such legally qualified medical practitioners to be medical referees for the purposes of this Act as he may, with the sanction of the Treasury, determine, and the remuneration of, and other expenses incurred by, medical referees under this Act shall, subject to regulations made by the Treasury, be paid out of moneys voted by Parliament.

Where a medical referee has been employed as a medical practitioner in connection with any case by or on behalf of an employer or workman or by any insurers interested, he shall not act as medical referee in that case.

(2) The remuneration of an arbitrator appointed by a judge of county courts under the Second Schedule to this Act shall be paid out of moneys provided by Parliament in accordance with regulations made by the Treasury.

11.—*Detention of ships.* (1) If it is alleged that the owners of any ship are liable as such owners to pay compensation under this Act, and at any time that ship is found in any port or river of England or Ireland, or within three miles of the coast thereof, a judge of any court of record in England or Ireland may, upon its being shown to him by any person applying in accordance with the rules of the court that the owners are probably liable as such to pay such compensation, and that none of the owners reside in the United Kingdom, issue an order directed to any officer of customs or other officer named by the judge requiring him to detain the ship until such time as the owners, agent, master, or consignee thereof have paid such compensation, or have given security, to be approved by the judge, to abide the event of any proceedings that may be instituted to recover such compensation and to pay such compensation and costs as may be awarded thereon ; and any officer of customs or other officer to whom the order is directed shall detain the ship accordingly.

(2) In any legal proceedings to recover such compensation, the person giving security shall be made defendant, and the production of the order of the judge, made in relation to the security, shall be conclusive evidence of the liability of the defendant to the proceeding.

(3) Section six hundred and ninety-two of the Merchant Shipping Act, 1894, shall apply to the detention of a ship under this Act as it applies to the detention of a ship under that Act, and, if the owner of a ship is a corporation, it shall for the purposes of this section be deemed to reside in the United Kingdom if it has an office in the United Kingdom at which service of writs can be effected.

12.—Returns as to compensation. (1) Every employer in any industry to which the Secretary of State may direct that this section shall apply shall, on or before such day in every year as the Secretary of State may direct, send to the Secretary of State a correct return specifying the number of injuries in respect of which compensation has been paid by him under this Act during the previous year, and the amount of such compensation, together with such other particulars as to the compensation as the Secretary of State may direct, and in default of complying with this section shall be liable on conviction under the Summary Jurisdiction Acts to a fine not exceeding five pounds.

(2) Any regulations made by the Secretary of State containing such directions as aforesaid shall be laid before both Houses of Parliament as soon as may be after they are made.

13.—Definitions. In this Act, unless the context otherwise requires,—

“Employer” includes any body of persons corporate or unincorporate and the legal personal representative of a deceased employer, and, where the services of a workman are temporarily lent or let on hire to another person by the person with whom the workman has entered into a contract of service or apprenticeship, the latter shall, for the purposes of this Act, be deemed to continue to be the employer of the workman whilst he is working for that other person ;

“Workman” does not include any person employed otherwise than by way of manual labor whose remuneration exceeds two hundred and fifty pounds a year, or a person whose employment is of a casual nature and who is employed otherwise than for the purposes of the employer's trade or business, or a member of a police force, or an outworker, or a member of the employer's family dwelling in his house, but, save as aforesaid, means any person who has entered into or works under a contract of service or apprenticeship with an employer, whether by way of manual labor, clerical work, or otherwise, and whether the contract is expressed or implied, is oral or in writing ;

Any reference to a workman who has been injured shall, where the workman is dead, include a reference to his legal personal representative or to his dependants or other person to whom or for whose benefit compensation is payable ;

“Dependants” means such of the members of the workman's family as were wholly or in part dependent upon the earnings of the workman at the time of his death, or would but for the incapacity due to the accident have been so dependent, and where the workman, being the parent or grandparent of an illegitimate child, leaves such a child so dependent upon his earnings, or, being an illegitimate child, leaves a parent or grandparent so dependent upon his earnings, shall include such an illegitimate child and parent or grandparent respectively ;

“Member of a family” means wife or husband, father, mother, grandfather, grandmother, step-father, step-mother, son, daughter, grandson, granddaughter, step-son, step-daughter, brother, sister, half-brother, half-sister ;

Ship,” “vessel,” “seaman,” and “port” have the same meanings as in the Merchant Shipping Act, 1894 ;

“Manager,” in relation to a ship, means the ship’s husband or other person to whom the management of the ship is entrusted by or on behalf of the owner ;

“Police force” means a police force to which the Police Act, 1890, or the Police (Scotland) Act, 1890, applies, the City of London Police Force, the Royal Irish Constabulary, and the Dublin Metropolitan Police Force ;

“Outworker” means a person to whom articles or materials are given out to be made up, cleaned, washed, altered, ornamented, finished, or repaired, or adapted for sale, in his own home or on other premises not under the control or management of the person who gave out the materials or articles ;

The exercise and performance of the powers and duties of a local or other public authority shall, for the purposes of this Act, be treated as the trade or business of the authority ;

“County court,” “judge of the county court,” “registrar of the county court,” “plaintiff,” and “rules of court,” as respects Scotland, mean respectively sheriff court, sheriff, sheriff clerk, pursuer, and act of sederunt.

14.—*Special provisions as to Scotland.* In Scotland, where a workman raises an action against his employer independently of this Act in respect of any injury caused by accident arising out of and in the course of the employment, the action, if raised in the sheriff court and concluding for damages under the Employers’ Liability Act, 1880, or alternatively at common law or under the Employers’ Liability Act, 1880, shall, notwithstanding anything contained in that Act, not be removed under that Act or otherwise to the Court of Session, nor shall it be appealed to that court otherwise than by appeal on a question of law ; and for the purposes of such appeal the provisions of the Second Schedule to this Act in regard to an appeal from the decision of the sheriff on any question of law determined by him as arbitrator under this Act shall apply.

15.—*Provisions as to existing contracts and schemes.* (1) Any contract (other than a contract substituting the provisions of a scheme certified under the Workmen’s Compensation Act, 1897, for the provisions of that Act) existing at the commencement of this Act, whereby a workman relinquishes any right to compensation from the employer for personal injury arising out of and in the course of his employment, shall not, for the purposes of this Act, be deemed to continue after the time at which the workman’s contract of service would determine if notice of the determination thereof were given at the commencement of this Act.

(2) Every scheme under the Workmen’s Compensation Act, 1897, in force at the commencement of this Act shall, if re-certified by the Registrar of Friendly Societies, have effect as if it were a scheme under this Act.

(3) The Registrar shall re-certify any such scheme if it is proved to his satisfaction that the scheme conforms, or has been so modified as to conform, with the provisions of this Act as to schemes.

(4) If any such scheme has not been so re-certified before the expiration of six months from the commencement of this Act, the certificate thereof shall be revoked.

16.—*Commencement and repeal.* (1) This Act shall come into operation on the first day of July, nineteen hundred and seven, but, except so far as it relates to medical referees, and proceedings consequential thereon, shall not apply in any case where the accident happened before the commencement of this Act.

(2) The Workmen’s Compensation Acts, 1897 and 1900, are hereby repealed, but shall continue to apply to cases where the accident happened before the commencement of this Act, except to the extent to which this Act applies to those cases.

17.—*Short title.* This Act may be cited as the Workmen’s Compensation Act, 1906.

EXTRACTS FROM SCHEDULES.

The following are all the parts of the Schedules which concern workmen : those omitted are for lawyers only.

FIRST SCHEDULE.

SCALE AND CONDITIONS OF COMPENSATION.

(1) The amount of compensation under this Act shall be—

(a) where death results from the injury—

(i) if the workman leaves any dependants wholly dependent upon his earnings, a sum equal to his earnings in the employment of the same employer during the three years next preceding the injury, or the sum of one hundred and fifty pounds, whichever of those sums is the larger, but not exceeding in any case three hundred pounds, provided that the amount of any weekly payments made under this Act, and any lump sum paid in redemption thereof, shall be deducted from such sum, and, if the period of the workman's employment by the same employer has been less than the said three years, then the amount of his earnings during the said three years shall be deemed to be one hundred and fifty-six times his average weekly earnings during the period of his actual employment under the said employer :

(ii) if the workman does not leave any such dependants, but leaves any dependants in part dependent upon his earnings, such sum, not exceeding in any case the amount payable under the foregoing provisions, as may be agreed upon, or, in default of agreement, may be determined, on arbitration under this Act, to be reasonable and proportionate to the injury to the said dependants ; and

(iii) if he leaves no dependants, the reasonable expenses of his medical attendance and burial, not exceeding ten pounds ;

(b) where total or partial incapacity for work results from the injury, a weekly payment during the incapacity not exceeding fifty per cent. of his average weekly earnings during the previous twelve months, if he has been so long employed, but if not then for any less period during which he has been in the employment of the same employer, such weekly payment not to exceed one pound :

Provided that—

(a) if the incapacity lasts less than two weeks no compensation shall be payable in respect of the first week ; and

(b) as respects the weekly payments during total incapacity of a workman who is under twenty-one years of age at the date of the injury, and whose average weekly earnings are less than twenty shillings, one hundred per cent. shall be substituted for fifty per cent. of his average weekly earnings, but the weekly payment shall in no case exceed ten shillings.

(2) For the purposes of the provisions of this schedule relating to "earnings" and "average weekly earnings" of a workman, the following rules shall be observed :—

(a) average weekly earnings shall be computed in such manner as is best calculated to give the rate per week at which the workman was being remunerated. Provided that where by reason of the shortness of the time during which the workman has been in the employment of his employer, or the casual nature of the employment, or the terms of the employment, it is impracticable at the date of the accident to compute the rate of remuneration, regard may be had to the average weekly amount which, during the twelve months previous to the accident, was being earned by a person in the same grade employed at the same work by the same employer, or, if there is no person so employed, by a person in the same grade employed in the same class of employment and in the same district ;

- (b) where the workman had entered into concurrent contracts of service with two or more employers under which he worked at one time for one such employer and at another time for another such employer, his average weekly earnings shall be computed as if his earnings under all such contracts were earnings in the employment of the employer for whom he was working at the time of the accident ;
- (c) employment by the same employer shall be taken to mean employment by the same employer in the grade in which the workman was employed at the time of the accident, uninterrupted by absence from work due to illness or any other unavoidable cause ;
- (d) where the employer has been accustomed to pay to the workman a sum to cover any special expenses entailed on him by the nature of his employment, the sum so paid shall not be reckoned as part of the earnings.

(3) In fixing the amount of the weekly payment, regard shall be had to any payment, allowance, or benefit which the workman may receive from the employer during the period of his incapacity, and in the case of partial incapacity the weekly payment shall in no case exceed the difference between the amount of the average weekly earnings of the workman before the accident and the average weekly amount which he is earning or is able to earn in some suitable employment or business after the accident, but shall bear such relation to the amount of that difference as under the circumstances of the case may appear proper.

(4) Where a workman has given notice of an accident, he shall, if so required by the employer, submit himself for examination by a duly qualified medical practitioner provided and paid by the employer, and, if he refuses to submit himself to such examination, or in any way obstructs the same, his right to compensation, and to take or prosecute any proceeding under this Act in relation to compensation, shall be suspended until such examination has taken place.

(5) The payment in the case of death shall, unless otherwise ordered as herein-after provided, be paid into the county court, and any sum so paid into court shall, subject to rules of court and the provisions of this schedule, be invested, applied, or otherwise dealt with by the court in such manner as the court in its discretion thinks fit for the benefit of the persons entitled thereto under this Act, and the receipt of the registrar of the court shall be a sufficient discharge in respect of the amount paid in :

Provided that, if so agreed, the payment in case of death shall, if the workman leaves no dependants, be made to his legal personal representative, or, if he has no such representative, to the person to whom the expenses of medical attendance and burial are due.

(8) Any question as to who is a dependant shall, in default of agreement, be settled by arbitration under this Act, or, if not so settled before payment into court under this schedule, shall be settled by the county court, and the amount payable to each dependant shall be settled by arbitration under this Act, or, if not so settled before payment into court under this schedule, by the county court. Where there are both total and partial dependants nothing in this schedule shall be construed as preventing the compensation being allotted partly to the total and partly to the partial dependants.

(9) Where, on application being made in accordance with rules of court, it appears to a county court that, on account of neglect of children on the part of a widow, or on account of the variation of the circumstances of the various dependants, or for any other sufficient cause, an order of the court or an award as to the apportionment amongst the several dependants of any sum paid as compensation, or as to the manner in which any sum payable to any such dependant is to be invested, applied, or otherwise dealt with, ought to be varied, the court may make such order for the variation of the former order or the award, as in the circumstances of the case the court may think just.

(10) Any sum which under this schedule is ordered to be invested may be invested in whole or in part in the Post Office Savings Bank by the registrar of the county court in his name as registrar.

(14) Any workman receiving weekly payments under this Act shall, if so required by the employer, from time to time submit himself for examination by a duly qualified

medical practitioner provided and paid by the employer. If the workman refuses to submit himself to such examination, or in any way obstructs the same, his right to such weekly payments shall be suspended until such examination has taken place.

(15) A workman shall not be required to submit himself for examination by a medical practitioner under paragraph (4) or paragraph (14) of this schedule otherwise than in accordance with regulations made by the Secretary of State, or at more frequent intervals than may be prescribed by those regulations.

Where a workman has so submitted himself for examination by a medical practitioner, or has been examined by a medical practitioner selected by himself, and the employer or the workman, as the case may be, has within six days after such examination furnished the other with a copy of the report of that practitioner as to the workman's condition, then, in the event of no agreement being come to between the employer and the workman as to the workman's condition or fitness for employment, the registrar of a county court, on application being made to the court by both parties, may, on payment by the applicants of such fee not exceeding one pound as may be prescribed, refer the matter to a medical referee.

The medical referee to whom the matter is so referred shall, in accordance with regulations made by the Secretary of State, give a certificate as to the condition of the workman and his fitness for employment, specifying, where necessary, the kind of employment for which he is fit, and that certificate shall be conclusive evidence as to the matters so certified.

Where no agreement can be come to between the employer and the workman as to whether or to what extent the incapacity of the workman is due to the accident, the provisions of this paragraph shall, subject to any regulations made by the Secretary of State, apply as if the question were a question as to the condition of the workman.

If a workman, on being required so to do, refuses to submit himself for examination by a medical referee to whom the matter has been so referred as aforesaid, or in any way obstructs the same, his right to compensation and to take or prosecute any proceeding under this Act in relation to compensation, or, in the case of a workman in receipt of a weekly payment, his right to that weekly payment, shall be suspended until such examination has taken place.

(16) Any weekly payment may be reviewed at the request either of the employer or of the workman, and on such review may be ended, diminished, or increased, subject to the maximum above provided, and the amount of payment shall, in default of agreement, be settled by arbitration under this Act:

Provided that where the workman was at the date of the accident under twenty-one years of age and the review takes place more than twelve months after the accident, the amount of the weekly payment may be increased to any amount not exceeding fifty per cent. of the weekly sum which the workman would probably have been earning at the date of the review if he had remained uninjured, but not in any case exceeding one pound.

(17) Where any weekly payment has been continued for not less than six months, the liability therefor may, on application by or on behalf of the employer, be redeemed by the payment of a lump sum of such an amount as, where the incapacity is permanent, would, if invested in the purchase of an immediate life annuity from the National Debt Commissioners through the Post Office Savings Bank, purchase an annuity for the workman equal to seventy-five per cent. of the annual value of the weekly payment, and as in any other case may be settled by arbitration under this Act, and such lump sum may be ordered by the committee or arbitrator or judge of the county court to be invested or otherwise applied for the benefit of the person entitled thereto: Provided that nothing in this paragraph shall be construed as preventing agreements being made for the redemption of a weekly payment by a lump sum.

(18) If a workman receiving a weekly payment ceases to reside in the United Kingdom, he shall thereupon cease to be entitled to receive any weekly payment, unless the medical referee certifies that the incapacity resulting from the injury is likely to be of a permanent nature. If the medical referee so certifies, the workman shall be entitled to receive quarterly the amount of the weekly payments accruing due during the preceding quarter so long as he proves, in such manner and at such intervals as may be prescribed by rules of court, his identity and the continuance of the incapacity in respect of which the weekly payment is payable.

(19) A weekly payment, or a sum paid by way of redemption thereof, shall not be capable of being assigned, charged, or attached, and shall not pass to any other person by operation of law, nor shall any claim be set off against the same.

(20) Where under this schedule a right to compensation is suspended no compensation shall be payable in respect of the period of suspension.

SECOND SCHEDULE.

ARBITRATION, ETC.

(1) For the purpose of settling any matter which under this Act is to be settled by arbitration, if any committee, representative of an employer and his workmen, exists with power to settle matters under this Act in the case of the employer and workmen, the matter shall, unless either party objects by notice in writing sent to the other party before the committee meet to consider the matter, be settled by the arbitration of such committee, or be referred by them in their discretion to arbitration as hereinafter provided.

(2) If either party so objects, or there is no such committee, or the committee so refers the matter or fails to settle the matter within six months from the date of the claim, the matter shall be settled by a single arbitrator agreed on by the parties, or in the absence of agreement by the judge of the county court, according to the procedure prescribed by rules of court.

(9) Where the amount of compensation under this Act has been ascertained, or any weekly payment varied, or any other matter decided under this Act, either by a committee or by an arbitrator or by agreement, a memorandum thereof shall be sent in manner prescribed by rules of court, by the committee or arbitrator, or by any party interested, to the registrar of the county court who shall, subject to such rules, on being satisfied as to its genuineness, record such memorandum in a special register without fee, and thereupon the memorandum shall for all purposes be enforceable as a county court judgment.

Provided that—

- (a) no such memorandum shall be recorded before seven days after the despatch by the registrar of notice to the parties interested ; and
- (b) where a workman seeks to record a memorandum of agreement between his employer and himself for the payment of compensation under this Act and the employer, in accordance with rules of court, proves that the workman has in fact returned to work and is earning the same wages as he did before the accident, and objects to the recording of such memorandum, the memorandum shall only be recorded, if at all, on such terms as the judge of the county court, under the circumstances, may think just ; and
- (c) the judge of the county court may at any time rectify the register ; and
- (d) where it appears to the registrar of the county court, on any information which he considers sufficient, that an agreement as to the redemption of a weekly payment by a lump sum, or an agreement as to the amount of compensation payable to a person under any legal disability, or to dependants, ought not to be registered by reason of the inadequacy of the sum or amount, or by reason of the agreement having been obtained by fraud or undue influence, or other improper means, he may refuse to record the memorandum of the agreement sent to him for registration, and refer the matter to the judge who shall, in accordance with rules of court, make such order (including an order as to any sum already paid under the agreement) as under the circumstances he may think just ; and
- (e) the judge may, within six months after a memorandum of an agreement as to the redemption of a weekly payment by a lump sum, or of an agreement as to the amount of compensation payable to a person under any legal disability, or to dependants, has been recorded in the register, order that the record be removed from the register on proof to his satis-

faction that the agreement was obtained by fraud or undue influence or other improper means, and may make such order (including an order as to any sum already paid under the agreement) as under the circumstances he may think just.

(10) An agreement as to the redemption of a weekly payment by a lump sum if not registered in accordance with this Act shall not, nor shall the payment of the sum payable under the agreement, exempt the person by whom the weekly payment is payable from liability to continue to make that weekly payment, and an agreement as to the amount of compensation to be paid to a person under a legal disability or to dependants, if not so registered, shall not, nor shall the payment of the sum payable under the agreement, exempt the person by whom the compensation is payable from liability to pay compensation, unless, in either case, he proves that the failure to register was not due to any neglect or default on his part.

(13) No court fee, except such as may be prescribed under paragraph (15) of the First Schedule to this Act, shall be payable by any party in respect of any proceedings by or against a workman under this Act in the court prior to the award.

(14) Any sum awarded as compensation shall, unless paid into court under this Act, be paid on the receipt of the person to whom it is payable under any agreement or award, and the solicitor or agent of a person claiming compensation under this Act shall not be entitled to recover from him any costs in respect of any proceedings in an arbitration under this Act, or to claim a lien in respect of such costs on, or deduct such costs from, the sum awarded or agreed as compensation, except such sum as may be awarded by the committee, the arbitrator, or the judge of the county court

THIRD SCHEDULE (SLIGHTLY ABBREVIATED).

The words in italics are from the second column of the Schedule.

Anthrax (*Handling of wool, hair, bristles, hides, and skins*). Lead poisoning. Mercury poisoning. Phosphorus poisoning. Arsenic poisoning. Ankylostomiasis (*Mining*). Poisoning by nitro- and amido-derivatives of benzene (dinitro-benzol, anilin, and others). Poisoning by carbon bisulphide. Poisoning by nitrous fumes. Poisoning by nickel carbonyl. Poisoning by African boxwood. Chrome ulceration. Eczematous ulceration of the skin produced by dust or caustic or corrosive liquids, or ulceration of the mucous membrane of the nose or mouth produced by dust. Epitheliomatous cancer or ulceration of the skin or of the corneal surface of the eye, due to pitch, tar, or tarry compounds. Scrotal epithelioma (chimney-sweeps' cancer). Nystagmus (*Mining*). Glanders. Compressed air illness. Subcutaneous cellulitis of the hand (beat hand) (*Mining*). Subcutaneous cellulitis over the patella (miners' beat knee) (*Mining*). Acute bursitis over the elbow (miners' beat elbow) (*Mining*). Inflammation of the synovial lining of the wrist joint and tendon sheaths (*Mining*).

Where regulations or special rules made under any Act of Parliament for the protection of persons employed in any industry against the risk of contracting lead poisoning require some or all of the persons employed in certain processes specified in the regulations or special rules to be periodically examined by a certifying or other surgeon, then, in the application of this schedule to that industry, the expression "process" shall, unless the Secretary of State otherwise directs, include only the processes so specified.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. Paper cover, design by A. G. Watts. 3d., post free 4d.; 2/3 per doz., post free, 2/7.

FABIANISM AND THE EMPIRE: A Manifesto. 1s. post free.

FABIAN ESSAYS IN SOCIALISM. (43rd Thousand.)

Paper cover, 1/-; plain cloth, 2/-, post free from the Secretary.

FABIAN TRACTS and LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 81, 3s.; post free 3/5. Bound in Buckram, 4/6; post free for 5s.

State Arbitration and the Living Wage.

THE disastrous effects of a great labor dispute which has paralyzed an industry for months are obvious to all, and the consequences of smaller disturbances, though less apparent, are in the aggregate scarcely less important. In the five years, 1898-1902, there have been, on an annual average, 632 strikes and lock-outs, involving 211,775 persons a year, and costing an annual loss of 5,716,026 working days. For thirty years everyone has been "ingeminating peace," and we propose, in the first place, to examine the machinery that exists to-day for preventing industrial war; and secondly, to consider in what way lasting peace can be secured.

Disputes may arise either out of the interpretation of an existing contract, or out of the framing of new terms of labor. To decide the former class is a judicial act, to determine the latter is a legislative function. Interpretation cases are on the Continent settled by special courts, but in England they are in no way distinguished from other cases, and, from the comparative rarity with which they come under the public eye, are scarcely included within the popular meaning of the term industrial dispute. In this Tract we shall deal mainly with the second class.

Method of Collective Bargaining.

For the proper consideration of disputes arising out of the framing of new labor contracts it is important to bear in mind that they are only the exceptional failures which occur in a complex system of negotiation between employers and employed. Where the men are disorganized the terms of labor are fixed at the will of the masters, but the trade unions practise a method of collective bargaining which ensures peace throughout a great part of the industrial world. Beginning with the negotiations of shop committees, or single branches, with individual employers, the process has developed into regular conferences between the organized masters on the one side and the union of all the workmen in the trade on the other, and the drawing up of collective agreements embodying common rules for the whole industry, fixing both wages and the other conditions of labor. Similarly with disputes affecting individuals only—from the intervention of the trade union secretary on behalf of a victimized workman we proceed to the regular examination of all complaints in the textile industry by the paid secretaries of the employers' and workmens' organizations, and the reference of the few cases in which they cannot agree to joint committees, first of the local, and finally of the central associations. In the higher grades of industry we have thus a private legislative system and a private judicial system established by mutual

agreement, and enforcing decisions by appeal to the law-abiding spirit of the people. The Board of Trade Bluebook on Standard Piece-work Lists,* will give some idea of the work of the unions. In 1902 only 1·4 per cent. of the workmen whose wages were altered in the course of the year were engaged in disputes on this account. Even when conferences and negotiations fail, and a strike or lock-out ensues, the unions are pre-eminent in effecting peace, and in 1897-1901 settled by direct negotiation 73·2 per cent. of the total strikes.

Temporary joint committees naturally develop into trade boards of a more permanent character, representative of employers and employed in equal proportions. In 1902 there were 67 such boards actually at work, which dealt with 1,462 cases, and settled 678. The Durham Joint Committee for the coal trade owes its success to the fact that while general wage-movements are determined on the basis of the old sliding scale, now abolished, it settles what alterations shall be made in the county average wage to meet the peculiarities of working in particular collieries, and arranges colliery as apart from county disputes. Provision is made for the reference to arbitration of cases which the committee cannot settle. The local boards in the boot trade, on the other hand, have "full power to settle all questions submitted to them concerning wages, hours of labor, and the conditions of employment of all classes of workpeople represented thereon within their districts." Their exercise of this jurisdiction is, however, governed by the clauses in the Agreement of 1895, referring to minimum wage, output, machinery, etc. Trade Boards, in fact, only seem to be successful where they work under carefully defined preliminary agreements.

The full power of collective bargaining through trade unions and trade boards is only attained in the few well-organized trades. For some time after 1890, District Boards of Conciliation were warmly advocated as a means of bringing the disputants together and inducing them to settle their differences amicably, that is by collective bargaining. Though they were welcomed by the weaker trades, their period of favor was brief, and in 1901 there were only nine such boards registered under the Conciliation Act, of which the London board is the chief. Finally, the reference of disputes to private persons is the oldest form of private intervention. With the disappearance of sliding scales, and the growing activity of the Board of Trade, it has become less prominent than formerly, but it is frequently provided for in collective agreements. Some notable modern instances, like the Coal War in 1893 and the Boot Trade Dispute of 1895, were really official Governmental interventions, not to arbitrate but to further the negotiations between the parties.

Government Mediation.

The report of the Royal Commission on Labor in 1894 recognized the failure of private attempts at mediation, and recommended (1) that Town and County Councils should be enabled to create special tribunals for defined districts or trades, more or less after the pattern

*Report on Wages and Hours of Labor, Part II. C.—7567 I. of 1894.

of the French *Conseils de Prud'hommes* ; (2) that a central department should promote by advice and assistance the formation of trade and district boards of conciliation and arbitration ; (3) that the Board of Trade should have power to enquire into and report on any trade dispute ; and (4) that the Board of Trade should have power to appoint an arbitrator, when requested by both parties. In 1896 the Conciliation (Trade Disputes) Act was passed, empowering the Board of Trade, where a dispute had arisen or was apprehended, (*a*) to enquire into the causes of the dispute ; (*b*) to induce the parties to meet together with a view to an amicable settlement ; (*c*) to appoint a person to act as conciliator when requested by either party ; (*d*) to appoint an arbitrator on the application of both parties. Private boards of conciliation and arbitration might be registered under the Act, and where no Board existed the Board of Trade might endeavor to get one formed.

This measure is thoroughly permissive, for neither can one party to a dispute compel the other to submit the difference to arbitration, nor is either bound by the award. In both these respects it is inferior to the Durham Joint Committee and the Boot Trade Boards, and it has been thoroughly discredited by its powerlessness to overcome the obstinacy of Lord Penrhyn, and by the tardiness and inefficacy of Mr. Ritchie's intervention in the engineering dispute. To the end of June, 1901,* 113 cases had been dealt with under the Act, nine on the initiative of the Board ; 32 disputes were settled by conciliation, 38 by arbitration, and 10 out of court ; in 33 cases a settlement was not effected, or the application was refused by the Board of Trade.

Compulsion in New Zealand.

New Zealand is the classical land of compulsory arbitration, the only land where it has had a fair trial, and the only land where industrial peace prevails. Since the Hon. W. P. Reeves, then Minister for Labor, carried in 1894 his Industrial Conciliation and Arbitration Act, "all matters or things affecting or relating to work done or to be done, or the privileges, rights, or duties of employers or workmen in any industry" are withdrawn from the domain of private warfare and placed under the regulation of law. In the first place that Act defined the bodies with which it had to deal by providing for the registration of any number of persons, not less than five employers or seven workmen, as industrial unions, which thereby become corporate bodies with power to sue and be sued. They alone could take proceedings under the Act, for the law took no cognizance of disputes between individual workmen and their masters, but yet unregistered employers or men were not exempt from the control of the law. These industrial unions might enter into industrial agreements with each other—or industrial unions of workmen with individual employers—dealing with any industrial matter or for the prevention or settlement of industrial disputes. These agreements—which resembled the "collective agreements" with which we are familiar—

* Third Report of the Board of Trade of Proceedings under the Conciliation (Trade Disputes) Act, 1896. C.—296.

must run for not more than three years, and were enforceable by law if they provided penalties for breach. The colony was divided into six districts, in each of which a Board of Conciliation has been established consisting of four persons, two chosen by the industrial unions of employers and two by the industrial unions of workmen, and of a chairman chosen by the Board from outside at its first meeting. In case the unions refused to take part in an election the Governor might nominate members to complete the Board, and he could also appoint a chairman if the Board could not agree on one. Special Boards might be appointed to meet special cases, to be elected in the same way. The Board was to hold office for three years. Industrial disputes could be referred to a Board for settlement either pursuant to an industrial agreement, or on the application of any party to a dispute, *i.e.*, an individual employer, or several employers, or an industrial union of employers or workmen. The parties might appear by their representatives or, if all sides agreed, by counsel or solicitors. After investigation the Board was to attempt to arrange an amicable settlement, failing which it "shall decide the question according to the merits and substantial justice of the case," and issue a report accordingly.

Any party to the case might thereupon require it to be submitted to the Court of Arbitration. This Court acts for the whole colony, and consists of a president, who must be a Judge of the Supreme Court, and two members recommended by the industrial unions of employers and workmen respectively. The Court holds office for three years, and, like the Boards, has power to inspect factories, administer oaths, and compel the production of documents or the attendance of witnesses. It may award costs and dismiss frivolous cases. All questions must be decided "in such manner as they find to stand with equity and good conscience." Every award must specify the parties upon whom, and the period, not exceeding two years, for which it is to be binding, and it must be given within one month after the Court has begun to sit for the hearing of any reference. On the application of any of the parties the Court may order the award to be filed in the Supreme Court office, and it is then enforceable in the same way as a judgment of the Supreme Court, the maximum fine being £500 for any union or person, and £10 for any individual on account of his membership in a union. No strike or lock-out must be declared after a case has been referred to a Board or to a Court, and proceedings are not to be nullified by mere want of formality.

The amending and consolidating Act of 1900 strengthened the Boards by giving their recommendations automatically the force of an industrial agreement unless an appeal was taken within a month. The term of agreements and awards was extended to three years, and even after the lapse of that period they were to continue in force until superseded by a new agreement or award. In giving their decisions the Boards or the Court may deal with industries other than the one actually affected if they are branches of the same trade or "so connected that industrial matters affecting the one may affect the other." The Court may also make an award covering the whole

colony "where the award relates to a trade or manufacture the products of which enter into competition in any market with those manufactured in another industrial district." An industrial union of workers may refer a dispute to a Board even if none of its members are directly concerned. Production of business-books may now be demanded only by the Court, not by the Boards. The Boards are reduced to three or five members. Expert assessors may be appointed either by a Board or the Court. Two employers may form an industrial union, and the Court may refuse to register an industrial union if there is already one in the neighborhood convenient for the applicants. A further amending Act of 1901 enabled trade unions to act as industrial unions without special registration, and defined the term "worker" as any person "employed to do any skilled or unskilled manual or clerical work for hire or award." To avoid the delay caused by the rush of applicants to the Boards and the frequency of appeals, this Act also allows any party to a dispute to take the case straight to the Court of Arbitration.

The Working of the Act.

Since the passing of the Act all trade disputes have been or are being dealt with on the application of the workmen. A few have been settled by Boards of Conciliation, but the majority were decided by the Court. The awards have been frankly accepted by the losing parties and not till February, 1898, was it necessary to appeal for a penalty. There have only been seven strikes involving altogether some 300 persons, and these occurred among unorganized workmen or government employees who did not come under the Acts. Although special care was taken, both by the creation of new bodies, industrial unions, with separate funds, etc., for the purposes of the Act, and by giving the Court power to award costs, in order to obviate the expected fear of the trade unions that their funds would be dissipated by vexatious litigation, the workmen have shown such confidence in the measure that most of the industrial unions of workmen registered under the Act are trade unions. On the other hand, employers have been very slow to avail themselves of the right of registration. In December, 1901, there were 241 industrial unions of workers and 12 industrial associations, but only 71 industrial unions of employers and one industrial association.

The Boards and the Court have had to deal with almost every possible kind of dispute. Minimum rates of wage have been established both for trades and for grades of workmen, and piecework lists have been drawn up. A standard working week has been fixed in several trades—forty-four hours in the case of the Christchurch builders; overtime has been defined, and work on Sundays and holidays limited. Codes of rules relating to piecework, apprentices, travelling allowances, the position of trade union officials, etc., have been framed. On several points of special difficulty important principles have been laid down. For example, on the "unemployed question" the Court decided in the case of the Westport Coal Co., 1896: "If work is slack, and the men wish, the company is recommended to distribute the work among the men rather than discharge

employees"—and again: "So long as there are sufficient capable men at Dennistoun out of work, the company shall employ these, either by contract or day-labor, provided they are willing to contract or work at reasonable rates, before the company calls for tenders from outsiders, or employs outsiders." In the awards establishing a standard wage an important condition is introduced dealing with a class of men whose employment is a frequent source of disturbance in this country: "Any workman who considers himself not capable of earning the minimum wage may be paid such less wage as may from time to time be agreed upon in writing between any employer and the secretary or president of the union." In default of agreement the chairman of the Conciliation Board for the district may fix the rate of wage to continue for six months, after which time it must come up again for revision.

Another regular clause deals with non-unionists as follows: "So long as the rules of the union permit any person of good character and sober habits, and a competent tradesman, to become a member on payment of an entrance fee not exceeding 5s., upon his written application, without ballot or other election, and so to continue upon contributing subscriptions not exceeding 6d. per week, the employers shall employ members of the union in preference to non-members, provided that there are members of the union equally qualified with non-members to perform the particular work; but this shall not compel an employer to refuse employment to any person now employed by him. When union and non-union men are employed together they shall work in harmony, and shall receive equal pay." The union, as a condition of this preference, must also keep, for the information of the employers, an "employment book," in which are recorded the names, addresses, qualifications, and particulars of previous service of all unemployed members. If an employer discharges all his union hands and replaces them by non-unionists the Court has decided that it still has jurisdiction.

In machinery questions the safeguards of a maximum working week and a standard rate of pay have been set up, and then (as in the Bootmaking Case, 1896) masters have been permitted to introduce machinery and to sub-divide machine-labor as they pleased. In the Furniture Trade Dispute, 1896, reductions on account of machinery were limited to 20 per cent. off the standard "log" prices.

Wage Boards in Victoria.

The Factories and Shops Act, 1896, established wage boards in the clothing, furniture and baking industries, and the Consolidating Act of 1900 extended the legal regulation of wages to any trade after the passing of a resolution by either House of Parliament. Under the former Act six Special Boards were appointed and under the latter thirty-two, so that altogether 35,000 persons out of 57,000 employed in factories or workshops in 1902 came under the law. The members of the boards are paid and are elected for two years, half by the employers half by the workers; an independent chairman is chosen by the elected members. The Board may fix either time or piece wages, but for outworkers in the boot and clothing trades only piece

rates may be fixed; time rates may be fixed and the employer allowed to pay piece rates based thereon. The Board must also fix the working hours, rates of overtime, and number of apprentices and improvers. Old or infirm persons unable to earn the minimum wage may be licensed by the Chief Inspector of Factories to work at a specified lower wage. A "determination" or award made by a Board continues in force until altered, and can only be challenged for "illegality" before the Supreme Court. The Governor may, however, suspend a "determination" for six months, within which time the Board must hear evidence and then decide finally.

Under these Boards sweating was abolished and wages were considerably raised. Thus the average weekly wage for all males in the baking trade rose from 32s. 5d. in 1896 to 42s. 6d. in 1901; in the clothing trade from 35s. 3d. to 40s. 5d.; and in bootmaking from 26s. 10d. to 34s. 5d. For all females the average weekly wage in the clothing trade rose from 15s. 5d. to 18s. 3d.; in the boot trade from 13s. 4d. to 15s. 3d.; and in the underclothing trade from 11s. 3d. (in 1898) to 12s. 7d. The wages for adults only are much higher, and the fixed minimum wage is never the actual wages paid. Thus, in 1901 the minimum wage fixed by the Clothing Board was 45s. for adult males and 20s. for adult females, but the average wages earned were 53s. 6d. and 22s. 3d. Under the Shirt Board the minimum wage for adult females was 10s. and the average wage 20s. 8d.

Nevertheless there have been serious difficulties in the working of the Acts. The Boards were too large, and had no power to call evidence, examine books, or decide the cases on anything but the written statements put forward by their members. The members thus regarded themselves not as judges but as the advocates of the side by which they were elected. To avoid giving either side an advantage the chairman was always chosen from outside the trade, and while he always worked for a compromise each side sought to weary or cajole him into the greatest possible preference for its views. Only the suspensory power of the Governor, by enabling evidence to be heard, made the law workable in many cases. Indeed the wonder is there has not been more friction than there actually was. The provisions for dealing with old and slow workers were clumsy, and further complications were added by the opposition to the regulation of apprenticeship in the sweated trades offered by employers greedy for cheap labor. In a noticeable number of cases, too, through complicity of the workpeople the minimum wage was not in practice observed. A Royal Commission was appointed in 1900 to investigate the working of the Factories and Shops Act, and in the spring of 1903 it reported against the continuance of the wage-board system, but, recognizing "that there cannot be any return to the old conditions of freedom of contract in factory labor," recommended the adoption of a scheme substantially based on the New Zealand Act which the commissioners described as "the fairest, the most complete, and the most useful labor law on the statute-books of the Australasian States." Meanwhile the Act of 1900 came to an end in 1902 and was renewed for a year; all determinations made after July, 1902, were suspended while the earlier ones were continued in force.

Arbitration in New South Wales.

The Industrial Arbitration Act of 1901 is closely modelled on the New Zealand law in its provisions for industrial unions and agreements. There are no Boards of Conciliation, but only one Court of Arbitration for the whole colony, consisting of a Judge of the Supreme Court and two members recommended by the industrial unions of workers and employers respectively. Other special points are that the Registrar of the Court may bring an industrial dispute before the Court; an employer who locks out his men while proceedings are pending may be fined £1,000 or imprisoned for two months; and most important of all—in any case before it the Court may “declare that any practice, regulation, rule, custom, term of agreement, condition of employment, or dealing whatsoever in relation to an industrial matter, shall be a common rule of the industry.” It is still too soon to say how this Act will work. Finally it may be noted that West Australia adopted in 1900 the New Zealand law, and about the same time South Australia set up a system of wage boards.

Failure of Voluntary Intervention.

State intervention in labor disputes when one of the parties cannot be compelled to arbitrate, and the award is not enforceable at law, can be summed up as a universal failure, and the contrast with the compulsory Act of New Zealand is striking. The causes are on the surface. Naturally the party in an industrial dispute which feels itself the stronger is unwilling to surrender the strategic advantage of position for the chance of winning less in arbitration, and when both are strongly organized the result may be disastrous. Secondly, intervention usually takes place too late, when angry passions have been roused and neither side is willing to believe in the other's good faith. Distrust of well-meaning but unskilled arbitrators counts for much, and the fact that arbitrators are usually drawn from the middle or upper classes has been a standing cause of objection by working men. This feeling is, however, changing. “Things are very different now,” said Mr. Mawdsley to an interviewer (*Sunday Chronicle*, 7th November, 1897), “the Board of Trade takes the matter up, and appoints a thoroughly able investigator.” Above all, the absence of a penalty for breach of the award nullifies the best intentions of the legislators. Actual breach of agreements formally entered into have fortunately been of comparatively rare occurrence in this country, but the statistics show that refusal to accept an unfavorable award is by no means uncommon everywhere. Or if the award is accepted the quarrel is renewed in a short time and arbitration refused.

The Right of the State.

The great difficulty in the way of arbitration is the refusal of the disputants to admit that anyone is concerned in their quarrel but themselves. When the Board of Trade at last intervened in the Engineering War its conduct was denounced by Sir Henry Howorth, F.R.S., M.P., as an “impertinence,” and the *Times*, October 7, 1897, declared that: “The right of interference by a Government depart-

ment can only be exercised to any good purpose when the conflict is practically over, and when one side or the other wishes to have an opportunity for honorable retreat." Against this belated theory of the right of private warfare we oppose the only theory under which social peace is possible—the right and duty of the State both to safeguard the national welfare and industry, and to secure the well-being of each of its members. This theory is particularly applicable to strikes and lock-outs where large numbers of people, not concerned in the dispute, are often seriously injured by the stoppage of work. For the sake of the public peace the State interferes in the purely private quarrels of a couple of litigants, for the sake of the public health it interferes at every turn with the rights of private property, for the sake of safety to life and limb it interferes with the internal arrangements of factories and mines and the right of an employer to do what he likes with his own, for the sake of common honesty it regulates the payment of wages by means of Truck Acts, "Particulars Clauses," and Checkweighmen. To extend this general principle of the regulation of industry by common rules to the determination of wages, hours, and the other conditions of labor is a natural sequence. It is not proposed, as is often objected, to compel employers to run their works at a loss, but it is proposed that if employers enter into an industry at all they shall conduct it on terms satisfactory to the public conscience. A man is not compelled to run a factory if he cannot afford it; but if he does open one it must have sufficient fire-escapes and satisfactory appliances against accidents. When the small boot and shoe manufacturers complained that they were being driven out of the trade by the agreements which the large factory-owners were making with the trade union, the editor of the *Shoe and Leather Record* replied: "If small manufacturers cannot continue to exist except by paying less than a proper standard of wages for work done, that is the clearest possible proof that they have no right to exist as such."* In return for this State interference employers are offered the opportunity of conducting their business under the rules of peace instead of war, of freedom from cessation of industry, and of having the terms and conditions of labor fixed for periods of sufficient duration to enable them to enter advantageously into future contracts. The workmen are given the great boon of steady rate of wages, and instead of having to maintain their standard of life in an unequal struggle against the present-day huge amalgamations of capital, they are offered an impartial umpire and a judicial enquiry.

The Principles of Arbitration.

When it is admitted that all labor disputes ought to be submitted to Boards of Arbitration whose awards should be enforceable at law, we are still left face to face with the problem of the principles upon which arbitration ought to be based. For practical purposes this means the principle on which wage questions must be arranged, for more than half the strikes and lock-outs originate in wage disputes.

* Vol. X., p. 254, 10th April, 1891; quoted in *Industrial Democracy*, by S. and B. Webb, Vol., pp. 549-550.

Before we can hope to abolish the appeal to force we must determine what is to be the controlling factor in fixing wages. There can be little expectation that either side in a dispute will be satisfied with an award of which they do not know the basis. The public view is that the decision must leave the national interests unimpaired. In New Zealand the settlement of disputes on the basis of the demands of "equity and good conscience" has led to progressively rising wages and progressively decreasing hours of labor. Such expressions are, however, too vague to suit the requirements of a highly organized industry. As a matter of fact, wage questions are debated upon one of two assumptions: that wages are dependent on profits or independent of them. The former assumption is naturally prevalent among employers, the latter among workmen, though not universally. The belief that capital should be assured of a certain minimum profit is one that arbitrators have often been credited with holding, and accounts for much of the dislike of the working classes to private arbitration. As Mr. Mawdsley told the Labor Commission (Group C., Q. 774): "Arbitrators generally go in for a certain standard of profit for capital—generally speaking, it has been 10 per cent. Mr. Chamberlain has always said that capital ought to have 10 per cent. If the arbitrator went in for 10 per cent. in the cotton trade we should have a very big reduction of wages; and we are not going to have it." Under the form that wages must follow prices, this same assumption was once very widely held among working men and still subsists among the miners of Northumberland and Durham and the ironworkers of the North of England. It was the governing idea of great arbitrators like Mr. (now Sir) David Dale and Dr. Spence Watson, and is strongly supported by Dr. Schultze-Gaevernitz, who says that the function of the arbitrator is "simply to find out what the price (of labor) would naturally have tended to become if he had not been called in . . . and discover the state of the balance of power between the two parties by scientific methods."* In the course of the last ten years, however, this assumption has been gradually replaced among the working classes by another, that wages must conform to a certain standard of life for each industrial grade. The Dock Strike of 1880 won over the general public to the belief that wages should not depend merely on the balancing of the supply of and demand for labor; and the Coal War of 1893 went far towards establishing the further principle that labor should be guaranteed a certain minimum wage not dependent on the price of the product. In the Boot Trade Dispute of 1895 it was agreed that the employers should not take advantage of the numbers thrown out of employment by machinery in order to reduce wages. The growth of this assumption has also been aided by the proved efficiency of high wages, and in fact it is rapidly replacing the other both among economists and in the general mind.

Legal Standards.

To give the support of the law-courts to the decisions of courts of arbitration means, frankly, the regulation of wages by law. Under

* *Social Peace*, p. 102.

such a system the remuneration of labor would no longer depend on the higgling of the market, whether between individuals or between associations of employers and employed, but would have to conform to some principle which the State had elected to support. The determination of this principle—or, rather, the choice between the two principles already set forth—is therefore all the more important. So far as has been tried in this country, the most successful method of determining wages is where a strong trade union negotiates directly with the employers. Such success, however, has been largely due to the fact that the organization of the workmen has been superior to that of the employers, and that consequently their strategic position has been stronger. Not agreement upon economic principle, but defective combination among factory-owners, has enabled the cotton operatives to maintain their wages against falling profits. The growing process of trustification in the cotton industry is removing this obstacle, and where the masters are solidly combined even organized labor is powerless, as the Engineering Dispute of 1897 has shown. The slow growth of trade unionism and its abject weakness in a large, and that the lowest and worst-off, section of the labor world are additional arguments for not leaving the Standard of Life to the sole protection of the unions. The general public of consumers have also this special responsibility in the matter, that to them is due the economic pressure under which the workmen is crushed ; for it is their insistence upon cheapness which, traced from the retail dealer through the middleman to the manufacturer, leads to the continual attacks on wages. The limitation of competition, by preventing the underselling of good employers by men who find their profit in low wages, is another object desirable both to the general public and to the best section of the capitalist class. And, failing other modes of settling wages, there is the danger, which realized itself for a time in the Birmingham staple trades and in the textile dyeing trade, that employers and employed should unite into “alliances” to put down competition and keep up prices and wages to the detriment of the general consumer. Finally, there is the transcendent interest of everyone in the freeing of industry from the serious losses caused by strikes and lock-outs.

We therefore conclude that the State should in its legislative capacity adopt the same principle which the Government departments and municipalities follow, and declare that wages fixed under its sanction must be an effective Living Wage.

If a Standard Living Wage were once established for a trade and fixed for a period of time, the fluctuations required by the exigencies of the market would be easier of determination. The standard ought to be not simply a minimum healthy subsistence wage, but a higher sum calculated to secure the average standard of comfort which the custom of the trade demands, to leave room for progressive improvement, and to fit the recipient for the life of an efficient citizen. It should also take into account the cost of training and the raising of a fresh generation of workers. Such a wage should be fixed for a somewhat long period, say five years, after which it should be revised to meet the new demands of progressive society.

It should be an absolute minimum upon which the conduct of industry should be based, just as there is a minimum of sanitary requirements. The increases which market fluctuations might permit should be granted for a lesser period, say not exceeding two years. The determination of wages would thus involve: first, the fixing of the Standard Living Wage for a trade; second, ascertaining the additions allowed by movements in the market; and, third, the application of these general rates to particular cases. The Standard Wage would not be as high as Mr. Pickard's ideal of 16s. a day for coalminers, but it would not fall as low as the 6s. per week which the sweated seamstress receives. It might be even somewhat under the wage now current in the given trade. These principles, therefore, should be set forth in the Act of Parliament to guide the Arbitration Boards in the determination of wages, and, in fact, in addition to their ordinary function of settling disputes referred to them, they should have the special duty of ascertaining and fixing Standard Rates of Wage. The terms of the Act would necessarily, to a certain degree, be lacking in precision, but they would still act as an effective guidance. The Admiralty finds no difficulty in obtaining through its own officials, or the Labor Department, the information on which to base a living wage for its employees.

The battle for a standard limit to the hours of labor is at present being fought out before Parliament; but there is no reason why the Arbitration Boards should not be utilized as legislative bodies on the lines already laid down in "Eight Hours by Law."* Both in this question and in that of wages it should be a legal rule that regard should be had to uniformity of conditions throughout the trade. It is adhesion to this principle which forms the strength of the Joint Committees in the cotton trade.

Constitution and Powers of the Boards.

Generally speaking wherever Arbitration Boards have been created the District and not the Trade has been the unit. Despite the success with which this system has worked in New Zealand it is doubtful whether it is applicable to this country. The failure of voluntary District Boards and the comparative success of Trade Boards is certainly significant. In a country where industry is much localized, a District Board would inevitably in its composition be confined to the dominant industry, and would be unsuited to determine questions dealing with the unrepresented trades. It is essential, in order to ensure confidence in its decisions, that the members of a Board should be fully qualified to deal with all practical details, and the trade is therefore the best administrative unit for this country.

Again, bearing in mind the experience of the coal and cotton industries, it would be expedient to distinguish between "local" and "trade" questions. Local Boards should be established in the different centres of the trade, and a Trade Board should be established for the whole trade. To the Local Boards should be assigned full power to settle all questions arising out of the interpretation of a contract,

* Fabian Tract No. 48.

or the application of a general rule to particular cases. In the settlement of new contracts Local Boards would first act as conciliators to facilitate collective bargaining between the two sides. If conciliation failed, the Board would give a decision, from which an appeal would lie to the Trade Board. In cases where the Board was unanimous it would probably be well to follow the precedent of the New Zealand Act of 1900 and allow no appeal. Besides dealing with appeals the Trade Boards would consider questions affecting the whole trade, such as an identical demand from several centres, Standard Living Wage, etc. It would on the whole be better to confine the Local Boards to interpretative cases, and the Trade Boards to the framing of trade rules; but while experience shows this to be possible in industries like the coal and cotton trades covering a number of competing centres, it would not be applicable to the building trades where the various localities are non-competing. In any case the Local Boards would only have to deal with market fluctuations above the Standard.

The Boards should be small in size, and each side should separately elect its own members. The suffrage might be given to all employers, but in the case of workmen only organized bodies of men should be dealt with. Trade Unions should be the labor electoral bodies, as they are responsible organizations which can be made to suffer for the default of their members. They should be corporate bodies for the purposes of this Act only, otherwise every petty-fogging solicitor would be encouraging men expelled from a society for blacklegging, etc., to bring actions for reinstatement or compensation for loss of friendly benefits. Members of Local Boards should reside continuously in their district during their term of office. The Trade Board might be elected by the members of the Local Boards, the two sides voting separately. At the first meeting of every Board a chairman should be chosen from outside. The Board of Trade should have power to settle all questions as to electoral areas, to nominate representatives where either side refused to take part in an election, and to nominate chairmen in cases of deadlock. The Boards should have full powers to conduct the necessary enquiries, inspect factories, appoint investigators, compel the attendance of witnesses, award costs, etc. The examination of complaints by experts, as in the cotton industry, should be in every way encouraged by the Board of Trade. The expenses of the Boards, including compensation to members for loss of time, should be borne by public funds.

Disputes should be referred to the Boards on the initiative either of an employer, or of an association of employers, or of a trade union, and no strike or lock-out after the reference should be permitted under pain of severe penalties. Parties could appear by their agents, but only by legal representatives with the consent of all concerned. Want of formality should not invalidate proceedings. Final awards should specify the persons upon whom, and the period, not exceeding two years, for which they are binding, and breach of an award should be made punishable by fine on the union or person concerned, as in New Zealand. Collective agreements made between parties volun-

tarily could be registered before a Board, and thereby become enforceable in the same manner as awards, provided they contained no worse terms for the workmen than those already contained in an award relating to the whole trade.

Finally, it may be pointed out that local authorities can anticipate the action of Parliament by specifying schedules of wages to be paid by the contractors to whom they give out work, and by making it a condition of the contract that all disputes between employer and workmen shall be referred to arbitration.

The Position of Trade Unions.

Under such a law the position of trade unions would be much altered from what it is at present. The drain on their funds to resist strikes and lock-outs, and to fight the masters in their attempts to put down picketing and restrict the right of combination, would cease, and it would consequently be in their power to increase their out-of-work and other benefits. While a trade union which occupied a strong strategic position in the labor market would have to resign its power to exact the full remuneration which the law of supply and demand might give it, a weak union would not be crushed by the mere money-power of capital. Their status would be greatly raised by the conferring of powers to take their share in the legal determination of the wages and other conditions of labor. In fact this would be their chief function in the future. For the right to strike would be substituted the power to legislate. A strong attraction would thus be exerted on the eight millions of workers who are at present outside the unions, while the raising of the wage-standard among the lowest ranks would enable many hundreds of thousands to join their organizations who are at present prevented by their poverty. Finally the wage-depressing competition of non-unionists would be stopped by decisions, on the New Zealand model, that unionists should be preferred to non-unionists when equally qualified for employment.

JUNE 1899.

Municipal Slaughterhouses.

DECEMBER, 1899.

It is a remarkable fact that while in most respects the sanitary code in this country is considerably in advance of those of the Continental nations, yet in the matter of meat inspection we are very far behind them.

Dr. Morison Legge, the Secretary to the Royal Commission on Tuberculosis, in his work on *Public Health in European Capitals*, says that in regard to meat-inspection "Great Britain is at least twenty years behind France, Germany, Belgium and Denmark."

Importance of Meat Inspection.

For the protection of public health it is of the utmost importance that all meat intended for human consumption should be examined and approved by a skilled inspector. Many diseases are caused by the consumption of unsound meat. Meat that has begun to putrefy is capable of causing acute, and often fatal, sickness and diarrhœa. Tapeworms, trichinosis, anthrax, tuberculosis and other diseases may be acquired by eating the flesh of animals that have suffered from those complaints, some of which are by no means uncommon. Tuberculosis is especially prevalent. It was found that 27 per cent. of the animals slaughtered in Saxony in 1895 were suffering from this disease. Mr. King, Veterinary Inspector to the Manchester Corporation (quoted in Legge and Sessions' *Cattle Tuberculosis*), states that at the slaughterhouse in that city 41 per cent. of the cows, 22 per cent. of the heifers, 25 per cent. of the bulls, and 16 per cent. of the bullocks were found to be infected with tuberculosis. It has been proved that this dreadful disease—which is responsible for one-seventh of our mortality, and last year killed 60,000 persons in England and Wales—may be acquired by eating the flesh of tuberculous animals. The Jews are required by their religious ritual to inspect meat with special care, and much is rejected by them. It is well known that they are freer from tuberculosis than their Gentile neighbors.

That this danger is real and ever present is proved by occasional disclosures concerning the seizure of tubs full of putrid livers destined for the manufacture of sinister "breakfast delicacies," or cow-beef containing "tuberculous deposits in some places as large as a small walnut."* These casual horrors are, however, soon forgotten, and the consumption of diseased meat goes on unchecked.

* *Meat Trades Journal*, July 4, 1899.

How can we Protect Ourselves from Diseased Meat?

In Germany, France and most civilized countries, slaughtering takes place at stated hours in large public slaughterhouses and all the meat is examined by highly trained inspectors, nearly all of whom are qualified veterinary surgeons. In this country the animals are killed in small private slaughterhouses, usually situated behind the butcher's shop. These slaughterhouses are very numerous. In London, for example, there were in 1897 no less than 470, and the number in smaller places is proportionally much greater; Sheffield, with a population of 356,000, contains 190 private slaughterhouses. The establishments are scattered over the town, no stated hours for slaughtering are observed, and the so-called inspectors are nearly always persons who have had no special training for their work. According to the Report of the Royal Commission on Tuberculosis: "In Battersea, for instance, four plumbers and three carpenters discharge the office of meat-inspectors; in Hackney the duties have been committed to two plumbers, one carpenter, one compositor, one bricklayer, one florist, one builder, one surveyor, and one stonemason. In Portsmouth a solitary butcher has received as colleagues three school-teachers, one medical dispenser, one carpenter, and one tram-conductor."

It is obvious that the task of efficiently inspecting a large number of scattered private slaughterhouses where slaughtering may take place at any time is one of extreme difficulty and would require a large and expensive staff of specially trained officials. But in the large municipal slaughterhouse, with slaughtering carried on at fixed hours, meat inspection becomes a comparatively simple business.

The Royal Commission on Tuberculosis reported that "the use of public slaughterhouses in populous places, to the exclusion of all private ones, is a necessary preliminary to a uniform and equitable system of meat inspection." This, important as it is, would not be the only advantage arising from the supersession of private establishments by public slaughterhouses. There are many other

Advantages of Municipal Slaughterhouses.

Many of our private slaughterhouses are in so insanitary a condition that the meat is exposed to foul emanations from drains, decomposing blood, offal, etc. They may easily become a source of grave danger to the surrounding districts. In municipal slaughterhouses, on the other hand, the buildings are specially designed for their purpose; they are kept in good sanitary condition, and the meat is therefore not subject to deterioration. The concentration of the business of slaughtering in one large establishment removes many sources of nuisance from the neighborhood of dwelling-houses, and by placing the building near a railway station, the driving of weary and exhausted cattle through the streets would be avoided and the street danger to the public would be lessened. On humanitarian grounds the superiority of municipal slaughterhouses is obvious. The closed doors of private slaughterhouses must hide many a pitiful

scene of clumsy cruelty. In our public establishments we could insist that none but skilled persons should be employed in the work of killing, and that only the most improved appliances, such as the Greener method, should be used.

German experience has shown the disadvantage arising from even the slightest modification of the municipal slaughterhouse system. In the Berlin slaughterhouses separate chambers are provided for each butcher who desires to rent one ; but this in practice has been found to militate against the inspection of meat, and hence in slaughterhouses more recently constructed the butchers slaughter in common halls, paying fees for the use of the premises. Osthoff (*Handbuch der Hygiene*, Vol. VI.), in considering the cost of the use of public slaughterhouses, and of the inspection of the meat in relation to the cost of the meat, estimates the additional cost due to these causes as amounting to about half-a-farthing per pound of meat. The German public slaughterhouses are in all cases self-supporting. The six municipal slaughterhouses of Paris cost the city £680,000, and as far back as 1851 they were stated to be yielding an interest of $6\frac{1}{2}$ per cent. per annum upon the outlay.

Provincial Experience.

By section 169 of the Public Health Act of 1875 any urban sanitary authority has the power to provide a public slaughterhouse, and the system is already in operation in fifty towns in the United Kingdom, and others, as Rochdale, in September, 1899, and Yarmouth in October, 1899, are adopting the same plan. In some cases, as, for example, Glasgow and Manchester, the system has proved a financial success ; in others, it has entailed some charge upon the rates. It must, however, be remembered that local success or failure depends largely upon the butchers, who may decide to use the municipal slaughterhouse, but cannot be compelled to do so. It is therefore not sufficient to provide the municipal slaughterhouse, we must also

Abolish the Private Slaughterhouses.

Many towns in England, Wales and Ireland have provided slaughterhouses, but (apart from a few exceptional instances) they have no power to abolish those under private control except in case of flagrant violation of the law. Dublin has erected a fine public slaughterhouse, but few butchers use it. They prefer the private slaughterhouses where practically the carcasses are not inspected and could not be without a large staff of inspectors. In Germany, when the town council has erected a public slaughterhouse, it may issue an order prohibiting the slaughtering of animals in the district except at the public slaughterhouse. In Scotland, a municipality has the power to declare that when a public slaughterhouse has been provided, no other place shall be used for slaughtering, except for a period of three years in the case of existing registered slaughterhouses. Scotch town councils should be urged to use this power, which, according to the recommendation of the Royal Commission on

Tuberculosis, should be extended to all towns in England, Wales and Ireland. English town councils should be urged to petition Parliament for legislation to this effect, and should meanwhile provide a public slaughterhouse.

The establishment of public slaughterhouses, and the abolition of private ones, are measures that have received the strong support of the medical profession in this country. At the meeting of the British Medical Association, in August 1899, the State Medicine Section unanimously supported Dr. Manby, the Assistant Medical Officer of Health of Liverpool, who read a paper strongly advocating the municipal slaughterhouse and the abolition of the private slaughterhouse. Our leading writers on public health are unanimous on this subject. It will suffice to quote Sir Richard Thorne Thorne, the Medical Officer to the Local Government Board: "Public slaughterhouses, officered by skilled inspectors, and supervised by medical officers of health, are urgently required, amongst other reasons, for the prevention of tuberculosis in man." "... the properly administered public slaughterhouse is demanded as an act of justice to those trading in meat; it is demanded in the interests of public health and of decency; it is demanded for the prevention of cruelty to the lower animals, and it is demanded to bring England—if not the United Kingdom—somewhat nearer to the level of other civilized nations in this matter."

HOW TRADE UNIONS BENEFIT WORKMEN.

What do Workmen Want ?

GOOD WAGES, Short Hours, Fair Conditions, Proper Treatment, Protection from arbitrary dismissals, Regular Work, and something to fall back on when work is scarce.

These are what Trade Unions can get for workmen and workwomen, and without Trade Unions no one is sure of them.

Let us take them in order.

Good Wages.—Why do men in one trade get 30s. or 40s. a week, whilst in another, for work as hard and no less skilled, they get 15s. or 20s. ? It is the Trade Union that makes the difference. Union men get more money because they demand it: "Ask and ye shall receive" is an old and true saying. But why cannot the man who has no Union ask ? Because he dare not. If one man asks for more wages, the employer replies: "I can't afford to pay more. If you don't like my job, you can go—there are plenty of other men to take it." And this is true. If a man keeps asking for more wages he gets the sack, and there is an end of it. A man who belongs to a Union has no need to ask for a rise of wages. His Union does that business for him, and a Union Secretary, paid by the men to manage their affairs, is not afraid of an employer, because his living does not depend upon any master except his fellow-workmen.

Men in a Union act together ; and their Union often makes them stronger than any one master, and sometimes almost as strong as all the masters put together.

An employer may sack one man for a mere whim. It is nothing to him. But he will often give up half his profits sooner than drive a big Union into a strike.

Men who want good wages and think they will get them without the help of a Trade Union are fools.

Short Hours.—What is true about wages is true also about hours. A strong Union gets men good wages for short hours: long hours and low pay fall to men who do not unite. Why do miners work eight hours, and engineers eight or nine, whilst agricultural laborers and van-men sometimes work twice as long, and generally get less than half the money? Years ago miners worked long hours for low pay. Then they started a Union, and that soon made a change. No trade gets short hours unless it has a strong Union.

Fair Conditions.—What is true of hours is equally true of conditions. Men who have a strong Union to look after them won't stand dirty, unhealthy workshops, or the petty tyrannies of foremen and managers.

Victimisation.—When a man stands up for his mates, and asks better wages, or complains of an unjust foreman, the employer is ready enough to get rid of him. "Such men," he says, "are a nuisance in a shop." Without a Union, no man dares to speak out what he thinks. But where the Union is strong the employer dare not dismiss a man merely for speaking his mind and standing up for his fellows. And if the Union cannot prevent dismissal, a man receives "victimised pay" from his Union until he gets another job, or else the other men come out in a body, and their Union backs them up until the "victimised" man is reinstated.

Regular Work.—When the master can make his men work as long as he pleases, he gets his orders done in a rush; if business becomes slack, his men can play for a bit. That may suit him, but it does not suit the men. Rent has to be paid and food bought each week, and regular money every Saturday is what the workman wants. In all the trades where a Union has organized the men, shortened the working hours and made overtime expensive to the masters, it has been found that work has become more regular.

Out-of-Work Benefit.—Many Unions pay this to help their members tide over slack times. How useful this is, every workman knows. Moreover, out-of-work benefit keeps up wages. A man is tempted to take less than the regular rate of wages if he has nothing in bad times to fall back on; and employers are always ready, if they dare, to take advantage of a man's need, by offering work at lower wages.

Trade Unions, like nearly all other good things in the world, have to be paid for. Let us see what the **Trade Unionist** gets for his money.

He gets **Officers** to look after his interests and to help him to get the full benefit of the **Workmen's Compensation Act**, the **Factory Acts**, the **Truck Acts**, and the other laws which employers are ready enough to evade when their workmen are not organized.

He gets **Strike Pay**, if he has to come out for better wages, shorter hours, or against an injury done to himself or some other member.

He gets **Out-of-Work Benefit** and **Sick and Accident Benefit**, in many Unions.

Many Unions do far more than this. Often they help men to get work by keeping lists of jobs, or because the employers apply to the Union when they want men. Some Unions pay funeral benefit. Others give old age pensions to members past work. Others insure tools against fire. Many regulate such matters as the number of apprentices. Some send their officials to Town and County Councils, and to Parliament, and thus give their trade a proper share in the making and administering of the laws.

The Labour Party.—Strong as are Trade Unions, one thing is stronger still, and that is the law. But the law, which in old days was made by the masters and for the masters, is now often made by the men and for the men. Why is this? Because the Trade Unions have formed with the Socialists a political party of their own. Men who belong to a Trade Union can through it send their own trade representatives to the House of Commons. The Miners have

eleven to represent them; the Railwaymen, three; the Iron Trades, four; and in all there are (1915) thirty-six Labor M.P.s sent to Parliament by Trade Union votes. The Miners, who are strong, got through Parliament a law forbidding the masters to work them more than eight hours. The State helps those who help themselves. If all trades were as well organized as the miners, all trades would get the laws they need to protect their interests. Men who join a Union help themselves, and at the same time help all their fellows.

Remember one thing! It is the Trade Union which keeps up wages and keeps down hours; which makes the master respect his men and treat them like human beings. Unions are paid for by the members. Any man who does not belong to a Union is spunging on his mates. He benefits by the better wages and shorter hours which the Union has obtained, but he refuses to pay his share towards the cost of getting them.

Therefore we say:—

Every workman and workwoman in the country
ought to

JOIN A TRADE UNION.

[Blank space to be filled by Trade Unions, if desired.]

PREFATORY NOTE.

SINCE the appearance of the following essay in the *Contemporary Review* (Feb. 1896) a Millionaire Movement has taken place, culminating in the recent expression of opinion by Mr. Andrew Carnegie that no man should die rich. A reference to Fabian Tract No. 5, "Facts for Socialists," will convince Mr. Carnegie that the danger he warns us against is still far from widespread. Nor is the doctrine new: John Ruskin "unloaded" and published his accounts with the public years ago; and Mr. Passmore Edwards's annual investments for the common good have come to be regarded as an ordinary asset, like the established Parliamentary Grants in Aid. But the modern substitution of Combination for Competition as the principle of capitalism is producing a new crop of individual fortunes so monstrous as to make their possessors publicly ridiculous. Unloading is, for the moment, the order of the day. The problem is, how to unload without the waste, pauperization, and demoralization that are summed up in England under the word charity. It seems clear from some late sensational disbursements that the Millionaires have not solved this problem. For this they cannot be blamed, because the problem is fundamentally insoluble under the social conditions which produce it; but they can at least do their best instead of their worst with their superfluity; and, so far, they seem to prefer, with the best intentions, to do their worst. In the hope that my essay may prove suggestive to them, the Fabian Society has decided to reprint it, with the permission of the Editor of the *Contemporary Review*, as a Fabian Tract.

SOCIALISM FOR MILLIONAIRES.

The Sorrows of the Millionaire.

THE millionaire class, a small but growing one, into which any of us may be flung to-morrow by the accidents of commerce, is perhaps the most neglected in the community. As far as I know, this is the first Tract that has ever been written for millionaires. In the advertisements of the manufactures of the country I find that everything is produced for the million and nothing for the millionaire. Children, boys, youths, "gents," ladies, artisans, professional men, even peers and kings are catered for ; but the millionaire's custom is evidently not worth having : there are too few of him. Whilst the poorest have their Rag Fair, a duly organized and busy market in Houndsditch, where you can buy a boot for a penny, you may search the world in vain for the market where the £50 boot, the special dear line of hats at forty guineas, the cloth of gold bicycling suit, and the Cleopatra claret, four pearls to the bottle, can be purchased wholesale. Thus the unfortunate millionaire has the responsibility of prodigious wealth without the possibility of enjoying himself more than any ordinary rich man. Indeed, in many things he cannot enjoy himself more than many poor men do, nor even so much ; for a drum-major is better dressed ; a trainer's stable-lad often rides a better horse ; the first class carriage is shared by office-boys taking their young ladies out for the evening ; everybody who goes down to Brighton for Sunday rides in the Pullman car ; and of what use is it to be able to pay for a peacock's-brain sandwich when there is nothing to be had but ham or beef ? The injustice of this state of things has not been sufficiently considered. A man with an income of £25 a year can multiply his comfort beyond all calculation by doubling his income. A man with £50 a year can at least quadruple his comfort by doubling his income. Probably up to even £250 a year doubled income means doubled comfort. After that the increment of comfort grows less in proportion to the increment of income until a point is reached at which the victim is satiated and even surfeited with everything that money can procure. To expect him to enjoy another hundred thousand pounds because men like money, is exactly as if you were to expect a confectioner's shopboy to enjoy two hours more work a day because boys are fond of sweets. What can the wretched millionaire do that needs a million ? Does he want a fleet of yachts, a Rotten Row full of carriages, an army of servants, a whole city of town houses, or a continent for a game preserve ? Can he attend more than one theatre in one evening, or wear more than one suit at a time, or digest more meals than his

outlet? Is it a luxury to have more money to take care of, more begging-letters to read, and to be cut off from those delicious Alnaschar dreams in which the poor man, sitting down to consider what he will do in the always possible event of some unknown relative leaving him a fortune, forgets his privation? And yet there is no sympathy for this hidden sorrow of plutocracy. The poor alone are pitied. Societies spring up in all directions to relieve all sorts of comparatively happy people, from discharged prisoners in the first rapture of their regained liberty to children revelling in the luxury of an unlimited appetite ; but no hand is stretched out to the millionaire, except to beg. In all our dealings with him lies implicit the delusion that *he* has nothing to complain of, and that he ought to be ashamed of rolling in wealth whilst others are starving.

Millionaires Less Than Ever Able to Spend Their Money on Themselves.

And please remember that his plight is getting worse and worse with the advance of civilization. The capital, the energy, the artistic genius that used to train themselves for the supply of beautiful things to rich men, now turn to supply the needs of the gigantic proletariats of modern times. It is more profitable to add an iron-mongery department to a Westbourne Grove emporium than it was to be a Florentine armorer in the fifteenth century. The very millionaire himself, when he becomes a railway director, is forced to turn his back on his own class, and admit that it is the third-class traffic that pays. If he takes shares in a hotel, he learns that it is safer, as a matter of commercial policy, to turn a lord and his retinue out of doors than to disoblige a commercial traveller or a bicyclist in the smallest reasonable particular. He cannot get his coat made to fit him without troublesome tryings-on and alterations unless he goes to the cheap ready-money tailors, who monopolize all the really expert cutters because their suits must fit infallibly at the first attempt if the low prices are to be made pay. The old-fashioned tradesman, servile to the great man and insolent to the earner of weekly wages, is now beaten in the race by the universal provider, who attends more carefully to the fourpenny and tenpenny customers than to the mammoth shipbuilder's wife sailing in to order three grand pianos and four French governesses. In short, the shops where Dives is expected and counted on are only to be found now in a few special trades, which touch a man's life but seldom. For everyday purposes the customer who wants more than other people is as unwelcome and as little worth attending to as the customer who wants less than other people. The millionaire can have the best of everything in the market ; but this leaves him no better off than the modest possessor of £5,000 a year. There is only one thing that he can still order on a scale of special and recklessly expensive pomp, and that is his funeral. Even this melancholy outlet will probably soon be closed. Huge joint-stock interment and cremation companies will refuse to depart to any great extent from their routine of Class I., Class II., and so on, just as a tramway com-

pany would refuse to undertake a Lord Mayor's Show. The custom of the great masses will rule the market so completely that the millionaire, already forced to live nine-tenths of his life as other men do, will be forced into line as to the other tenth also.

Why Millionaires Must Not Leave Too Much to Their Families.

To be a millionaire, then, is to have more money than you can possibly spend on yourself, and to suffer daily from the inconsiderateness of those persons to whom such a condition appears one of utter content. What, then, is the millionaire to do with his surplus funds? The usual reply is, provide for his children and give alms. Now these two resources, as usually understood, are exactly the same thing, and a very mischievous thing too. From the point of view of society, it does not matter a straw whether the person relieved of the necessity of working for his living by a millionaire's bounty is his son, his daughter's husband, or merely a casual beggar. The millionaire's private feelings may be more highly gratified in the former cases; but the mischief to society and to the recipient is the same. If you want to spoil a young man's career, there is no method surer than that of presenting him with what is called "an independence," meaning an abject and total dependence on the labor of others. Anybody who has watched the world intelligently enough to compare the average man of independent means when he has just finished his work at the university, with the same man twenty years later, following a routine of fashion compared to which the round of a postman is a whirl of excitement, and the beat of a policeman a chapter of romance, must have sometimes said to himself that it would have been better for the man if his father had spent every penny of his money, or thrown it into the Thames.

Parasites on Property.

In Ireland, the absentee landlord is bitterly reproached for not administering his estate in person. It is pointed out truly enough that the absentee is a pure parasite upon the industry of his country. The indispensable minimum of attention to his estate is paid by his agent or solicitor, whose resistance to his purely parasitic activity is fortified by the fact that the estate usually belongs mostly to the mortgagees, and that the nominal landlord is so ignorant of his own affairs that he can do nothing but send begging letters to the agent. On these estates generations of peasants (and agents) live hard but bearable lives; whilst off them generations of ladies and gentlemen of good breeding and natural capacity are corrupted into drifters, wasters, drinkers, waiters-for-dead-men's-shoes, poor relations, and social wreckage of all sorts, living aimless lives, and often dying squalid and tragic deaths. But is there any country in the world in which this same wreckage does not occur? The typical modern proprietor is not an Irish squire but a cosmopolitan shareholder; and the shareholder is an absentee as a matter of course. If his property is all the better managed for that,

he himself is all the more completely reduced to the condition of a mere parasite upon it ; and he is just as likely as the Irish absentee to become a centre of demoralization to his family connections. Every millionaire who leaves all his millions to his family in the ordinary course exposes his innocent descendants to this risk without securing them any advantage that they could not win more effectually and happily by their own activity, backed by a fair start in life. Formerly this consideration had no weight with parents, because working for money was considered disgraceful to a gentleman, as it is still, in our more belated circles, to a lady. In all the professions we have survivals of old pretences—the rudimentary pocket on the back of a barrister's gown is an example—by which the practitioner used to fob his fee without admitting that his services were for sale. Most people alive to-day, of middle age and upward, are more or less touched with superstitions that need no longer be reckoned with by or on behalf of young men. Such, for instance, as that the line which divides wholesale from retail trade is also a line marking a step in social position ; or that there is something incongruous in a lord charging a shilling a head for admission to his castle and gardens, or opening a shop for milk, game, and farm produce ; or that a merchant's son who obtains a commission in a smart regiment is guilty of an act of ridiculous presumption.

Dignity of Labor.

Even the prejudice against manual labor is vanishing. In the artistic professions something like a worship of it was inaugurated when Ruskin took his Oxford class out of doors and set them to make roads. It is now a good many years since Dickens, when visiting a prison, encountered Wainwright the poisoner, and heard that gentleman vindicate his gentility by demanding of his fellow prisoner (a bricklayer, if I remember aright) whether he had ever condescended to clean out the cell, or handle the broom, or, in short, do any work whatever for himself that he could put on his companion. The bricklayer, proud of having so distinguished a cell mate, eagerly gave the required testimony. In the great Irish agitation against coercion in Ireland during Mr. Balfour's secretaryship, an attempt was made to add to the sensation by pointing to the spectacle of Irish political prisoners, presumably gentlemen, suffering the indignity of having to do housemaid's work in cleaning their cells. Who cared ? It would be easy to multiply instances of the change of public opinion for the better in this direction. But there is no need to pile up evidence. It will be quite willingly admitted that the father who throws his son on his own exertions, after equipping him fully with education and a reasonable capital, no longer degrades him, spoils his chance of a well-bred wife, and forfeits the caste of the family, but, on the contrary, solidifies his character and widens his prospects, professional, mercantile, political, and matrimonial. Besides, public opinion, growing continually stronger against drones in the hive, begins to threaten, and even to execute, a differentiation of taxation against unearned incomes ;

so that the man who, in spite of the protests of parental wisdom and good citizenship, devotes great resources to the enrichment and probable demoralization of remote descendants for whose merit the community has no guarantee, does so at the risk of having his aim finally defeated by the income-tax collector. We, therefore, have the intelligent and public-spirited millionaire cut off from his old resource of "founding a family." All that his children can now require of him, all that society expects him to give them, all that is good for themselves, is a first-rate equipment, not an "independence."

And there are millionaires who have no children.

Why Almsgiving is a Waste of Money.

The extremities to which the millionaire is reduced by this closing up of old channels of bequest are such that he sometimes leaves huge sums to bodies of trustees "to do good with," a plan as mischievous as it is resourceless; for what can the trustees do but timidly dribble the fund away on charities of one kind or another? Now I am loth to revive the harsh strains of the Gradgrind political economy: indeed, I would, if I could, place in every Board School a copy of Mr. Watts' picture of a sheet profiled by the outline of a man lying dead underneath it, with the inscription above, "What I saved, I lost: what I spent, I had: what I gave, I have." But woe to the man who takes from another what he can provide for himself; and woe also to the giver! There is no getting over the fact that the moment an attempt is made to organize almsgiving by entrusting the funds to a permanent body of experts, it is invariably discovered that beggars are perfectly genuine persons: that is to say, not "deserving poor," but people who have discovered that it is possible to live by simply impudently asking for what they want until they get it, which is the essence of beggary. The permanent body of experts, illogically instructed to apply their funds to the cases of the deserving poor only, soon become a mere police body for the frustration of true begging, and consequently of true almsgiving. Finally, their experience in a pursuit to which they were originally led by natural benevolence lands them in an almost maniacal individualism and an abhorrence of ordinary "charity" as one of the worst of social crimes. This may not be an amiable attitude; but no reasonable person can fail to be impressed by the certainty with which it seems to be produced by a practical acquaintance with the social reactions of mendicity and benevolence.

"The Deserving Poor."

Of course, this difficulty is partly created by the "deserving poor" theory. I remember once, at a time when I made daily use of the reading-room of the British Museum—a magnificent communistic institution—I gave a £2 copying job to a man whose respectable poverty would have moved a heart of stone: an ex-schoolmaster, whose qualifications were out of date, and who, through no particular fault of his own, had drifted at last into the reading-room as less literate men drift into Salvation Army Shelters. He was a sober,

well-spoken, well-conducted, altogether unobjectionable man, really fond of reading, and eminently eligible for a good turn of the kind I did him. His first step in the matter was to obtain from me an advance of five shillings; his next, to sublet the commission to another person in similar circumstances for one pound fifteen, and so get it entirely off his mind and return to his favorite books. This second, or rather, third party, however, required an advance from my acquaintance of one-and-sixpence to buy paper, having obtained which, he handed over the contract to a fourth party, who was willing to do it for one pound thirteen and sixpence. Speculation raged for a day or two as the job was passed on; and it reached bottom at last in the hands of the least competent and least sober copyist in the room, who actually did the work for five shillings, and borrowed endless sixpences from me from that time to the day of her death, which each sixpence probably accelerated to the extent of fourpence, and staved off to the extent of twopence. She was not a deserving person: if she had been she would have come to no such extremity. Her claims to compassion were that she could not be depended upon, could not resist the temptation to drink, could not bring herself to do her work carefully, and was therefore at a miserable disadvantage in the world: a disadvantage exactly similar to that suffered by the blind, the deaf, the maimed, the mad, or any other victims of imperfect or injured faculty. I learnt from her that she had once been recommended to the officials of the Charity Organization Society; but they, on inquiring into her case, had refused to help her because she was "undeserving," by which they meant that she was incapable of helping herself. Here was surely some confusion of ideas. She was very angry with the Society, and not unreasonably so; for she knew that their funds were largely subscribed by people who regarded them as ministers of pity to the poor and downcast. On the other hand, these people themselves had absurdly limited the application of their bounty to sober, honest, respectable persons: that is to say, to the persons least likely to want it, and alone able to be demoralized by it. An intelligent millionaire, if tempted to indulge himself by playing the almsgiving philanthropist (to the great danger of his own character) would ear-mark his gift for the use of the utterly worthless, the hopelessly, incorrigibly lazy, idle, easy-going, good-for-nothing. Only, such a policy would soon exhaust the resources of even a billionaire. It would convince the most sentimental of almsgivers that it is economically impossible to be kind to beggars. It is possible to treat them humanely, which means that they can be enslaved, brought under discipline, and forced to perform a minimum of work as gently as the nature of the process and their own intense objection to it permit; but there is no satisfaction for the compassionate instincts to be got out of that. It is a public duty, like the enforcement of sanitation, and should be undertaken by the public. Privately supported colonies of the unemployed, like that of the Salvation Army at Hadleigh, are only the experiments on which an inevitable extension of the Poor Law will have to be based. What is urgently needed at

present by the poor is the humanization of the Poor Law, an end which is retarded by all attempts to supplant it by private benevolence. Take, for example, the hard case of the aged poor, who are not beggars at all, but veterans of industry who have in most cases earned an honorable pension (which we are dishonest enough to grudge them) by a lifetime of appalling drudgery. We have to deal with at least 350,000 of them every year. Very little can be done by private efforts to rescue these unfortunate people from the barbarity of the ratepayers by building a few almshouses here and there. But a great deal can be done by arousing the public conscience and voting for reasonably humane and enlightened persons at elections of guardians. The guardians of the West Derby (Liverpool) Union, instead of imprisoning aged couples separately and miserably in their workhouse, put them into furnished cottages, where, provided they keep them neat and clean, they are no more interfered with than if they were in a private almshouse. The difference in happiness, comfort, and self-respect, between the cottage and the workhouse, is enormous: the difference in cost is less than two shillings a week per pair. If a millionaire must build almshouses, he had better do it by offering to defray the cost of a set of cottages on condition that the guardians adopt the West Derby system. This, of course, is pauperizing the ratepayer; but the average ratepayer is a quite shameless creature, loud in his outcry against the immorality of pauperizing any one at his expense, but abject in his adulation of the rich man who will pauperize him by those subscriptions to necessary public institutions which act as subsidies in relief of the rates.

Never Endow Hospitals.

Hospitals are the pet resource of the rich man whose money is burning a hole in his pockets. Here, however, the verdict of sound social economy is emphatic. Never give a farthing to an ordinary hospital. An experimental hospital is a different thing: a millionaire who is interested in proving that the use of drugs, of animal food, of alcohol, of the knife in cancer, or the like, can be and should be dispensed with, may endow a temporary hospital for that purpose; but in the charitable hospital, private endowment and private management mean not only the pauperization of the ratepayer, but irresponsibility, waste and extravagance checked by spasmodic stinginess, favoritism, almost unbridled licence for experiments on patients by scientifically enthusiastic doctors, and a system of begging for letters of admission which would be denounced as intolerable if it were part of the red tape of a public body. A safe rule for the millionaire is never to do anything for the public, any more than for an individual, that the public will do (because it must) for itself without his intervention. The provision of proper hospital accommodation is pre-eminently one of these things. Already more than a third of London's hospital accommodation is provided by the ratepayers. In Warrington the hospital rate, which was 2d. in the pound in 1887-8, rose in five years to 1s. 2d. If a billionaire had

interposed to take this increase on his own shoulders, he would have been simply wasting money for which better uses were waiting, demoralizing his neighbors, and forestalling good hospitals by bad ones. Our present cadging hospital system will soon go the way of the old Poor Law ; and no invalid will be a penny the worse.

Be Careful in Endowing Education.

Education comes next to hospitals in the popular imagination as a thoroughly respectable mark for endowments. But it is open to the same objections. The privately endowed elementary school is inferior to the rate-supported one, and is consequently nothing but a catchpit in which children, on the way to their public school, are caught and condemned to an inferior education in inferior buildings under sectarian management. University education is another matter. But whilst it is easy to found colleges and scholarships, it is impossible to confine their benefits to those who are unable to pay for them. Besides, it is beginning to be remarked that university men, as a class, are specially ignorant and misinformed. The practical identity of the governing class with the university class in England has produced a quite peculiar sort of stupidity in English policy, the masterstrokes of which are so very frequently nothing but class solecisms that even the most crudely democratic legislatures of the Colonies and the most corrupt lobbies of the United States are superior to ours in directness and promptitude, sense of social proportion, and knowledge of contemporary realities. An intelligent millionaire, unless he is frankly an enemy of the human race, will do nothing to extend the method of caste initiation practised under the mask of education at Oxford and Cambridge. Experiments in educational method, and new subjects of technical education, such, for instance, as political science considered as part of the technical education of the citizen (who is now such a disastrously bungling amateur in his all-important political capacity as voter by grace of modern democracy); or economics, statistics, and industrial history, treated as part of the technical commercial education of the wielder of modern capitals and his officials: these, abhorrent to university dons and outside the scope of public elementary education, are the departments in which the millionaire interested in education can make his gold fruitful. Help nothing that is already on its legs is not a bad rule in this and other matters. It is the struggles of society to adapt itself to the new conditions which every decade of modern industrial development springs on us that need help. The old institutions, with their obsolete routine, and their lazy denials and obstructions in the interests of that routine, are but too well supported already.

Endowing Societies.

The objection to supplanting public machinery by private does not apply to private action to set public machinery in motion. Take, for example, the National Society for the Prevention of Cruelty to Children. If that society were to undertake the punish-

ment of cruel parents by building private prisons and establishing private tribunals, even the most thoughtless subscriber to private charities and hospitals would shake his head and button up his pocket, knowing that there are public laws and public prisons and tribunals to do the work, and that they alone should be trusted with such functions. But here the public machinery requires the initiative of an aggrieved person to set it in motion ; and when the aggrieved person is a child, and its "next friend" the aggressor, the machinery does not get started. Under such circumstances, Mr. Waugh's society, by stepping in and taking the child's part, does a great deal of good ; and this, observe, not by supplanting the State, or competing with it, but by co-operating with it and compelling it to do its duty. Generally speaking, all societies which are of the nature of Vigilance Committees are likely to be useful. The odium which attaches to the name came from the old-fashioned American Vigilance Committee, which, in the true spirit of private enterprise, not only detected offenders, but lynched them on its own responsibility. We have certain State vigilance officers : sanitary inspectors, School Board visitors, a Public Prosecutor (of a sort), the Queen's Proctor, and others. The only one of these who is an unmitigated public nuisance is the censor of the theatre, who, instead of merely having power to hale the author of an obnoxious play before a public tribunal, has power to sentence him to suppression and execute him with his own hands and on his own responsibility, with the result that our drama is more corrupt, silly, and indecent than any other department of fine art, and our unfortunate censor more timid and helpless than any other official. His case shows the distinction which it is essential to observe in vigilance work. But though we have an official to prevent Tolstoy's plays from being performed, we have no official to prevent people from stealing public land and stopping up public footpaths. The millionaire who gives money to "Days in the Country" for city children, and will not help Commons Preservation Societies and the like to keep the country open for them, is unworthy of his millions.

All these considerations point in the same direction. The intelligent millionaire need not hesitate to subsidize any vigilance society or reform society that is ably conducted, and that recognizes the fact that it is not going to reform the world, but only, at best, to persuade the world to take its ideas into consideration in reforming itself. Subject to these conditions, it matters little whether the millionaire agrees with the society or not. No individual or society can possibly be absolutely and completely right ; nor can any view or theory be so stated as to comprise the whole truth and nothing but the truth. A millionaire who will not subsidize forces that are capable of a mischievous application will subsidize nothing at all. Such justice as we attain in our criminal courts is the outcome of a vehemently partial prosecution and defence ; and all parliamentary sanity is the outcome of a conflict of views. For instance, if we try to figure to ourselves a forcible reconstruction of society on lines rigidly deduced either from the Manchester School or from State Socialism

we are at a loss to decide which of the two would be the more intolerable and disastrous. Yet who hesitates on that account, if such matters interest him, to back up the Fabian Society on the one hand, or the Personal Rights Association on the other, according to his bias? Our whole theory of freedom of speech and opinion for all citizens, rests, not on the assumption that everybody is right, but on the certainty that everybody is wrong on some point on which somebody else is right, so that there is a public danger in allowing anybody to go unheard. Therefore, any propagandist society which knows how to handle money intelligently and which is making a contribution to current thought, whether Christian or Pagan, Liberal or Conservative, Socialist or Individualist, scientific or humanitarian, physical or metaphysical, seems to me an excellent mark for a millionaire's spare money.

Yet after all, mere societies are good marks for anybody's spare money. Most of them may be left to the ordinary guinea subscriber; and though millionaires are such inveterate subscribers and donors that I dare not leave the societies out of account, I confess I despise a millionaire who dribbles his money away in fifties and hundreds, thereby reducing himself to the level of a mere crowd of ordinary men, instead of planking down sums that only a millionaire can. My idea of a millionaire is a man who never gives less than ten thousand pounds, ear-marked for the purchase of something of the best quality costing not a penny less than that amount. The millionaire should ask himself what is his favorite subject? Has it a school, with scholarships for the endowment of research and the attraction of rising talent? Has it a library, or a museum? If not, then he has an opening at once for his ten thousand or hundred thousand.

Starting Snowballs.

There is always something fascinating to the imagination of a very poor man in the notion of leaving a million or so to accumulate at compound interest for a few centuries, and then descend in fabulous riches on some remote descendant and make a Monte Cristo of him. Now, even if there were likely to be any particular point in being Monte Cristo after a couple of hundred years further social and industrial development, a modern millionaire, for the reasons already stated, should be the last person in the world to be much impressed by it. Still, the underlying idea of keeping a great money force together, multiplying it, and finally working a miracle with it, is a tempting one. Here is a recent example, quoted from a local paper :

"The gift of a farm to the Parish Council of St. Bees by the Rev. Mr. Pagan, of Shadforth, Durham, is accompanied by some peculiar conditions. The farm is 33a. 3r. 2p. in extent, and is valued at £1,098. The rent of the farm is to be allowed to accumulate, with two reservations. Should the grantor ever require it, the council may be called upon during his lifetime to pay him from time to time out of the accumulated investments any amounts not exceeding £1,098. Not more than £10 may be spent in charity, *but not in relief of the rates*. The balance is to be invested in land and houses until all the land and houses in the parish have been secured by the parish council. When that is accomplished, the sum of £1,098 may be handed over to some adjacent parish, which shall deal with the gift similarly to St. Bees."

Beware of the Ratepayer and the Landlord.

In the above bequest, we have a remarkable combination of practical sagacity and colossal revolutionary visionariness. Mr. Pagan sets a thousand pound snowball rolling in such a way as to nationalize the land parish by parish until the revolution is complete. Observe—and copy—his clause, “not in relief of the rates.” Let the millionaire never forget that the ratepayer is always lying in wait to malversate public money to the saving of his own pocket. Possibly the millionaire may sympathize with him, and say that he wishes to relieve him. But in the first place a millionaire should never sympathize with anybody: his destiny is too high for such petty self-indulgence; and in the second, you cannot relieve the ratepayer by reducing, or even abolishing, his rates, since freeing a house of rates simply raises the rent. The millionaire might as well leave his money direct to the landlords at once. In fact, the ratepayer is only a foolish catspaw for the landlord, who is the great eater-up of public bequests. At Tonbridge, Bedford, and certain other places, pious founders have endowed the schools so splendidly that education is nobly cheap there. But rents are equivalently high; so that the landlords reap the whole pecuniary value of the endowment. The remedy, however, is to follow the example of the Tonbridge and Bedford founders instead of avoiding it. If every centre of population were educationally endowed with equal liberality, the advantage of Bedford would cease to be a *differential* one; *and it is only advantages which are both differential and pecuniarily realizable by the individual citizens that produce rent.* Meanwhile, the case points to another form of the general rule above deduced for the guidance of millionaires: namely, that bequests to the public should be for the provision of luxuries, never of necessities. We must provide necessities for ourselves; and their gratuitous provision in any town at present constitutes a pecuniarily realizable differential advantage in favor of living in that town. Now, a luxury is something that we need not have, and consequently will not pay for except with spare or waste money. Properly speaking, therefore, it is something that we will not pay for at all. And yet nothing is more vitally right than the attitude of the French gentleman who said: “Give me the luxuries of life, and I will do without the necessities.” For example, the British Library of Political Science is prodigiously more important to our well-being than a thousand new charitable soup-kitchens; but as ordinary people do not care a rap about it, it does not raise the rent of even students’ lodgings in London by a farthing. But suppose a misguided billionaire, instead of founding an institution of this type, were to take on himself the cost of paving and lighting some London parish, and set on foot a free supply of bread and milk! All that would happen would be that the competition for houses and shops in that parish would rage until it had brought rents up to a point at which there would be no advantage in living in it more than in any other parish. Even parks and open spaces raise rents in London, though, strange to say,

London statues do not diminish them. Here, then, is the simple formula for the public benefactor. Never give the people anything they want : give them something they ought to want and dont.

Create New Needs: the Old Ones Will Take Care of Themselves.

Thus we find at the end of it all, appositely enough, that the great work of the millionaire, whose tragedy is that he has not needs enough for his means, is to create needs. The man who makes the luxury of yesterday the need of to-morrow is as great a benefactor as the man who makes two ears of wheat grow where one grew before. John Ruskin set a wise example in this respect to our rich men. He published his accounts with the public, and shewed that he had taken no more for himself than fair pay for his work of giving Sheffield a valuable museum, which it does not want and would cheerfully sell for a fortnight's holiday with free beer if it could. Was not that better than wasting it heartlessly and stupidly on beggars, on able-bodied relatives, on ratepayers, on landlords, and all the rest of our social absorbents? He has created energy instead of dissipating it, and created it in the only fundamentally possible way, by creating fresh needs. His example shows what can be done by a rich expert in fine art ; and if millions could bring such expertness to their possessor, I should have discoursed above of the beautification of cities, the endowment of a standard orchestra and theatre in every centre of our population, and the building of a wholesome, sincere, decent house for Parliament to meet in (noble legislation is impossible in the present monstrosity) as an example for parish halls and town halls all through the country, with many other things of the same order. But these matters appeal only to a religious and artistic faculty which cannot be depended on in millionaires—which, indeed, have a very distinct tendency to prevent their possessor from ever becoming even a thousandaire, if I may be permitted that equally justifiable word. The typical modern millionaire knows more about life than about art ; and what he should know better than anyone else, if he has any reflective power, is that men do not succeed nowadays in industrial life by sticking to the methods and views of their grandfathers. And yet not until a method or a view has attained a grandfatherly age is it possible to get it officially recognized and taught in an old country like ours. In bringing industrial education up to date, the millionaire should be on his own ground. Experiment, propaganda, exploration, discovery, political and industrial information : take care of these, and the pictures and statues, the churches and hospitals, will take care of themselves.

Conscience Money and Ransom.

I must not conclude without intimating my knowledge of the fact that most of the money given by rich people in "charity" is made up of conscience money, "ransom," political bribery, and bids for titles. The traffic in hospital subscriptions in the name of Royalty fulfils exactly the same function in modern society as Texel's traffic

in indulgences in the name of the Pope did before the Reformation. One buys moral credit by signing a cheque, which is easier than turning a prayer wheel. I am aware, further, that we often give to public objects money that we should devote to raising wages among our own employees or substituting three eight-hour shifts for two twelve-hour ones. But when a millionaire does not really care whether his money does good or not, provided he finds his conscience eased and his social status improved by giving it away, it is useless for me to argue with him. I mention him only as a warning to the better sort of donors that the mere disbursement of large sums of money must be counted as a distinctly suspicious circumstance in estimating personal character. Money is worth nothing to the man who has more than enough ; and the wisdom with which it is spent is the sole social justification for leaving him in possession of it.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and a complete list of publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

FABIAN ESSAYS IN SOCIALISM. Paper 6d.; cloth 1/6; post. 2½d. and 4d

WHAT TO READ on Social and Economic Subjects. 1s. n. and 2s. n.

THIS MISERY OF BOOTS. By H. G. WELLS. 3d., post free 4d.

FABIAN TRACTS and **LEAFLETS.**

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 81, 3s.; post free 3/5. Bound in Buckram, 4/6 n.; post free 5s.

Cottage Plans and Common Sense.

How to provide for the Housing of the People is a problem for which our larger municipalities are now being compelled to find some solution ; and all over the country these bodies are busy preparing plans for housing schemes. Social reformers are generally agreed that the people must be housed outside the congested town areas ; many, like the Garden City Association, advocating the creation of entirely new towns. Such thoroughgoing schemes are hardly yet practicable for municipal bodies ; but under the Housing Act of 1900 they now have power to build outside their own districts : and in the following remarks on the character of the houses required it is taken that the best policy for the municipalities is to build attractive cottages on the outskirts of their towns, always having due regard to the reasonable accessibility from these houses of places of employment and centres of interest and amusement.

In building, that work is being done for the future rather than the present must never be forgotten. It is of the utmost importance that dwellings which are to last one hundred years or more should be of such a character as it is reasonable to suppose will be valuable dwellings during the whole of their lifetime. As a matter of mere financial justice to succeeding generations this is essential, especially in view of the demand for an extension of the time over which payment for the buildings can be spread. Obviously it is not fair to borrow on the future and build for the present only. It is not enough for a municipal authority to copy the house and arrangement which satisfies the average builder or speculator. Only the very best that is known and can be devised to-day is likely to stand the test of time ; and this must be based upon the permanent and essential conditions of life and health, not on passing fashions or conventions established by the speculative builder.

Chief Purpose of a House. In designing any particular building it is generally very helpful to take the primary requirements and think out the problem from the beginning, as though no custom in connection with such buildings had ever grown up. Only in this way is it possible to separate the essential requirements and conditions from others which are merely conventional, and to get them all into some due perspective of importance. In like manner, to approach the question of cottage design and arrangement from the point of view of the original requirements, and develop from them, will probably be the best way to bring the various points into true relations. It is safe to assume that shelter from inclement weather, protection from predatory neighbors (human or otherwise), and comfort and privacy for family life, were the chief reasons which impelled men in the first instance to live in houses. Probably the seeker for house-room to-day is influenced by much the same considerations, although the second, protection, has lost some of its force. In satisfying this desire for shelter, comfort and privacy, one is at once confronted by a difficulty : the roof and walls which shut out the driving rain, the searching wind and the neighbors' prying eyes, at the same time exclude fresh air and sunlight, the full enjoyment

of which is one of the most necessary conditions of a healthy life. Against this difficulty it is a primary duty of the house-builder to be on his guard. The degree both of shelter and privacy must, in fact, be limited to what is compatible with a sufficiency of fresh air and sunlight.

Air and Sunlight. Modern building bye-laws have already done something towards securing air-space to every house, though, as will presently appear, there are methods of defeating their object, which they do not at present touch. But a sufficiency of air may be regarded as an acknowledged first condition for every decent house. The necessity for sunshine has still to receive the same public recognition; and there can be no doubt that our present knowledge of the importance of sunlight to health makes it needful to add to the first condition a second, that every house shall be open to a sufficiency of sunshine. Every house should at least get some sunshine into the room in which the family will live during the day-time. Into as many more of the rooms as possible let the sun come, but let no house be built with a sunless living room: and this condition must cease to be regarded merely as *desirable* when it can conveniently be arranged: it must be insisted upon as an absolute *essential*, second only to air-space: other things must, if need be, give way before it. At the present time, although for larger houses acknowledged as an important point, for cottages the question of aspect seems hardly to be considered; and, where thought of at all, a comparatively trivial consideration, such as the convention that a cottage should face to the street, is allowed to over-ride it. The essential thing is that every house should turn its face to the sun, whence come light, sweetness and health. The direction of roads and the fronting to streets are details which must be made to fall in with this condition, or to give way to it.

By no means the least advantage which will arise from giving to aspect its due weight will be the consequent abolition of backs, back yards, back alleys and other such abominations,

Back Yards. which have been too long screened by the insidious excuse of that wretched prefix *back*. For if every house is to face the sun, very often it must also have "its front behind"—as the Irishman expressed it. The little walled-in back yard is of course somewhat firmly established in the public affection: entrenched behind the feelings of pride and shame, it appeals alike to those who are too proud to be seen keeping their houses clean and tidy, and to those who are ashamed to have it seen how unclean and untidy they are. To encourage pride is a doubtful advantage, while it is a positive disadvantage to weaken in any way the incentive towards cleanliness which shame might bring. Like lumber-rooms, too, these yards constitute a standing temptation to the accumulation of litter, far too strong for the average mortal to resist: old hampers, packing cases, broken furniture and such like find a resting-place there in which to rot, instead of being promptly disposed of. They are but wells of stagnant air, too often vitiated by decaying rubbish and drains. Back yards have, of course, their uses and advantages. They are convenient for the younger children to play in; but, alas! how very unsuitable! Too often sunless,

always dreary, the typical back yard, shut in with walls and out-buildings, is about as sad a spot as one could offer to children for a playground. The coster may keep his barrow there, and the hawker sort his wares; while as open air washhouses something may be said for them. But some of these uses are occasional only, and too much must not be sacrificed for them, while the rest may be met in other ways. It does not seem to be realized that hundreds of thousands of working women spend the bulk of their lives with nothing better to look on than the ghastly prospect offered by these back yards, the squalid ugliness of which is unrelieved by a scrap of fresh green to speak of spring, or a fading leaf to tell of autumn.

Town or Country. How far the improvement of transit facilities and the solution of the land question would enable the whole of the dwellers in large towns to be spread out on the basis of about six houses to the acre, as at Bourneville, has yet to be proved. Undoubtedly, whenever at all possible of attainment, the majority of men would accept Mr. Ruskin's ideal of a house: "Not a compartment of a model lodging house, not the number so and so Paradise Row, but a cottage all of our own, with its little garden, its healthy air, its clean kitchen, parlor and bedrooms." Under present conditions in large towns such schemes seem beyond the reach of municipalities. It is the great suburban districts which have to be considered for the present, where, after all, the majority of working folk are housed, neither in the country nor in the city, but between the two: those vast areas filled with streets of houses where it seems impossible to secure for each cottage land enough for a separate garden, where houses are not six to the acre, but four or five times six, or even more.

Open Space. Some space to each house, however, there must be, even in towns. If, instead of being wasted in stuffy yards and dirty back streets, the space which is available for a number of houses were kept together, it would make quite a respectable square or garden. The cottages could then be grouped round such open spaces, forming quadrangles opening one into the other, with wide streets at intervals. Every house could be planned so that there should be a sunny aspect for the chief rooms, and a pleasant outlook both front and back.* At present it is too often the custom to draw out a cottage plan that will come within a certain space and then repeat it unaltered in street after street, heedless of whether it faces north, south, east or west. Nothing more absurd or more regardless of the essential conditions could be imagined. Every house should be designed to suit its site and its aspect; and this is not less necessary when dealing with small houses built in rows, but more so.

Quadrangle. There is something at once homely and dignified about a quadrangle which gives it a charm even when the buildings are quite simple and unadorned. There is a sense of unity, of a complete whole, which lifts it out of the commonplace in a manner that nothing can accomplish for a mere street of cottages.† Each square could have some individuality of treatment,

* See Plate I.

† See Plates II. and III.

the entrances could be utilized to produce some little central feature, and the effect of thus grouping small cottages to produce collectively a larger unit in the street, of a scale capable of assuming some dignity, would be such an improvement as will not readily be realized by any who have not seen what a few simple college quads may do for an otherwise commonplace street. An Oxford or Cambridge college is simply a collection of separate small tenements, built in squares, with some central common buildings. It is undoubtedly the most satisfactory arrangement for numbers of such tenements where the space is limited. In this manner from twenty to thirty houses, according to size, can be arranged to an acre, including streets; and this number should nowhere be exceeded except under very great pressure. Even if it must be exceeded, probably it is better to go up and make extra floors, let in flats, than to curtail the open space. One larger space of ground is more effective than a number of small yards. Squares, such as suggested, would always be sweet and fresh, being open to the sun and large enough to be airy without being draughty. The distance across, preventing the overlooking of windows, would ensure the essential privacy of the house, in spite of the want of back yards. The space in the centre would allow a few trees to grow, some gardens to be made, and a safe play place for the children to be provided, while it would afford a pleasant and interesting outlook for all the cottages.

In the planning and laying out of these squares it would be well to provide for all sorts of tastes, for it will be easy to get plenty of variety. In some cases the whole square could be filled with allotment gardens let to those who wanted them; in others the space might be devoted to a broad lawn for tennis or bowls; in some a band of small gardens might surround a children's central playground, and in others a public garden be established; in some cases there might be a roadway all round the quadrangle, while in others the road might run down the centre with gardens attached to the houses on each side. On some sites it would be possible to get three-sided squares open to the south. Where the cost of land makes it needful to build more than two storeys high it would be a great advantage if on the southern side the buildings were kept lower to allow the sun to get well into the court.

In some localities the corner houses of squares would not pass existing bye-laws; there would in such a case be an opening for small walled gardens, which would be a boon to break the monotony of the streets, while stores, laundries, warehouses, workshops, and other needful buildings might find sites on these corners.

Self-contained Houses. Before passing on to internal arrangement it is necessary to refer to the plan of building small houses with long projections running out behind, which, common in all towns, is almost universal in London. These projections effectually shade the rooms from such sunshine as they might otherwise get, and impede the free access of fresh air. Some municipal flat-dwellings afford a depressing example of this. In these houses the living rooms, which are only about ten feet square, face each other across a narrow space between such projections, and are only eleven

feet apart.* That a municipality could build living rooms at the top of an alley 24 ft. long, with windows only 11 ft. from the face of the opposite house, and could call that "clearing the slums," affords surely some measure of what slums must be. From such rooms the sun is effectually excluded, whatever their aspect; little fresh air will penetrate to the ends of those blind alleys; and a drearier outlook one would hardly have thought it possible to conceive. But, alas, it *has* been conceived; and on a fine estate near London there are to be found houses of this type having kitchens (sure to be used as living rooms) the windows of which look into alleys only 10 ft. 3 in. wide; these windows project, and the fronts are just 6 ft. 3 in. apart, while between them rise blackened wood fences exactly 3 ft. from each window! These houses are specially planned to accommodate two families, being provided with two living rooms and two outlets to the back.† To realize how bad this type of house is, one has but to consider how they would appear in the light of the most lenient building bye-laws if the doors from the main buildings to the projections were built up, making each house into two cottages technically, as already it is two virtually. Some municipalities would then consider themselves almost justified in pulling down such projecting cottages, to let air and light reach the others. They are virtually "back to back" houses opening on to 11 ft. wide streets with a dead end. Where houses must be built in rows, it is difficult to get enough air and sun to them in any case; and it is only possible to do this when all projections which can cause stagnation or shade are avoided. Every house in a row should contain all its rooms and offices under the main roof, and present an open and fair surface to sun and air on both its free sides. If so built it matters not which side is to the street, or which to the court; both are alike presentable; the aspect can govern the arrangement of the rooms unhampered by superstitions of front and back.‡

The self-contained house is not only better but more economical. A given cubic space can be built more cheaply when it is all within the main walls and under the main roof. A somewhat greater width of frontage is needed, and where streets are already laid out there might be extra cost of ground due to this which would be greater than the saving in the building. But the narrow house with straggling projections requires greater depth; and the deeper the houses the greater is the expense of the side streets which has to be divided among them. Where land is to be laid out, if the quadrangle arrangement is adopted, there need be no waste in side streets, because the houses face all ways, and this would about balance the extra cost of street ~~per~~ house due to the wider frontage, while the saving of detached outbuildings and back yard walls would mean a considerable economy.

Cottages must fit the life of occupants. Under present rates of ground rents, cost of building and wages of occupants, we must reluctantly admit that it is hardly possible to give to every cottage all that is in the abstract desirable. But, far from being a reason why the ideal of cottage accommodation should be left out of

consideration, this is really a most cogent argument for its careful study. For the less the accommodation it is possible to give, the more important it is that what is given shall be so carefully apportioned that the house may approach as far as possible to the ideal. Although we all probably hope and strive for some change in one or other of the restricting conditions, for the time being it is needful to remember that a certain limited rent will only pay for a certain limited space. Except by a very careful study of the life which that space is to shelter, it is not possible to design the house so as to properly fit and accommodate that life. And it is only by making the house fit the life of its occupants that a right and economical use of the space can be obtained. The available room must be most liberally given where it will be most thoroughly and continuously used. When mankind first took to living in houses these consisted of one room; perhaps the most important fact to be remembered in designing cottages is that the cottager still lives during the day-time in one room, which for the sake of clearness is best

Living-room. called the living-room. In the vast majority of cases the housewife has neither time nor energy to keep more than one room in constant use, and, during the greater part of the year, the cost of a second fire effectually prevents another room from being occupied. This living-room, then, will be the most thoroughly used and in all ways the chief room of the house; here the bulk of the domestic work will be done, meals will be prepared and eaten, and children will play, while the whole family will often spend long evenings there together. The first consideration in planning any cottage should be to provide a roomy, convenient, and comfortable living-room, having a sunny aspect and a cheerful outlook. In it there should be space to breathe freely, room to move freely, convenience for work, and comfort for rest. It must contain the cooking stove, some good cupboards, and a working dresser in a light and convenient place.* No box 11 or 12 feet square should be provided for this purpose. Such a place cannot be healthy when occupied by a whole family, nor can it be other than inconvenient and uncomfortable.† In a very small room neither door nor window will be kept open except in very hot weather, because there can be no avoiding the direct draught. It is very important to plan a living-room so that the doors or stairs may not destroy the comfort, or even the sense of comfort. They should be kept away from the fire, and, above all, should not open across either the fire or the window. By far the most comfortable arrangement is to have the outer door set inwards a little, in a shallow porch, leaving a window-recess on the same wall; if the room is a fair length, say not less than 15 feet, the door can then be wide open, and yet the light side of the room be free from draught. The common arrangement of an inside porch with the inner door opening at right angles to the outer one, directs the draught straight across the window to the fire, and largely destroys the sense of comfort in the room, while cutting it off more effectually from the fresh air. The chimney extracts a very large volume of air continuously from the room, and this must be made good

* See Plates VII. and IX.

† See Plate VI.; also VIII.

from outside. The more easily this air can come in the less keen will be the draught. It is not sufficiently realized that what has to be done is not to exclude cold air, which is impossible in a room with a fire, but to admit it in the way which will give the best ventilation with the least discomfort. In planning the room the furni-

Furniture. ture should always be arranged and drawn in, to make sure that provision has been made for work and rest, for meals and play. Many a room is ruined because the dresser, the table, and the settle, have not been tried in on the plan.

Bay Windows. Windows facing the street are much less depressing if slightly bayed to invite a peep up and down as well as across; a projection of a few inches in the centre, with some advantage taken of the thickness of the wall to set back the sides, will suffice to add very much to the outlook.*

Fittings. With regard to windows, doors, cupboards, and all other fittings, it should not be forgotten that when a quantity is required, as is usually the case in housing schemes, no extra cost is entailed by having them well designed, and of good proportions. Money is often spent in bad ornament, which but detracts from the appearance of the buildings; but an elegant mould or shaping costs no more than a vulgar one, and a well proportioned door or mantel is as easily made as one ill-proportioned. That nothing can be spent on the ornamentation of artisans' cottages is no excuse whatever for their being ugly. Plain and simple they must be, but a plain and simple building well designed may be very far from ugly.

Bedrooms. After the living-room, the sleeping-rooms must be regarded as next in importance, for these will be occupied all the night. Of these it is only needful to say that they should be as large as can be provided, and as well ventilated as possible. There should be plenty of windows, easily opened, and everything possible done to encourage the opening of them. If the rooms can be arranged so that there shall be a comfortable corner between fire and window, where a quiet hour with book or pen can be spent, this is very desirable. For there is no real reason why the accommodation of the small house should not be increased by a more general use of the bedrooms for these purposes.

Larder. A small larder with direct light and ventilation should be provided for every cottage, the window of which should not be exposed to the heat of the sun. A cupboard in the living-room, even when ventilated, is hardly a fit place in which to keep food.†

Scullery. A scullery, to relieve the living-room from the more dirty work, should be the next consideration. This must have a glazed, well-drained sink, under an opening window. If the washing is to be done in each cottage, there must be a copper or set-pot and space for a small mangle to stand. When it can be arranged, a little cooking-stove, just large enough to be used in hot weather, will be a boon. But it is not well to put the main cooking-stove in the scullery, for the result will inevitably be

* See Plates VI. and VIII.

† See Plates VI. and VIII.

that, for the greater part of the year, the family will live with the fire, in the tiny scullery, and the more airy living-room will be left vacant, and will, in fact, become a parlor.

However desirable a parlor may be, it cannot be said
Parlor. to be necessary to health or family life; nor can it be compared in importance with those rooms and offices which we have been considering. There can be no possible doubt that until any cottage has been provided with a living-room large enough to be healthy, comfortable, and convenient, it is worse than folly to take space from that living-room, where it will be used every day and every hour, to form a parlor, where it will only be used once or twice a week.

If this is true of the parlor, how much more true is it of the passage? To cut a piece three feet wide off the end of a small room, for the very doubtful advantage of having two doors between the inmates and the fresh air, or to obtain the occasional convenience it may be for a visitor or member of the family to be able to pass in or out without being observed, is surely an extreme instance of valuable room and air space sacrificed to thoughtless custom and foolish pride.* Any one who has known what it is to occupy a large airy house-place will not readily sacrifice its advantages for either a needless parlor or a useless passage. For the question is not whether it is an advantage to have either a passage or parlor in addition to a decent living-room, but whether it is worth while to have either at the sacrifice of the living-room. A desire to imitate the middle-class house is at the bottom of the modern tendency to cut the cottage up into a series of minute compartments.

Stairs and Landing. In small houses, such as we are considering, the 500 or so cubic feet of air space which are usually shut up in a staircase and landing, would be much more useful if thrown open to the living-room. That there is any advantage at all, either to that room or to the bedrooms, in having this "buffer state" of stagnant air between them, seems extremely doubtful; while there can be no doubt at all of the immense gain of having an extra 500 feet of air in a room which contains, perhaps, only 1,400 feet altogether, and many rooms contain less. The space should in any case have ventilation, and direct light is, of course, desirable. The extra height which would be obtained by throwing stairs and landing open to the living-room would greatly help in keeping that room well ventilated, as also would the possibility of having a window open so far from the occupied parts of the room.

To complete the self-contained cottage, there must be
Coals, etc. found some place for coals, some small receptacle for ashes and rubbish, to be emptied every few days, and a water-closet or properly fitted earth-closet. A porch opening from the scullery provides a suitable place for these, so that, while within the main building, they may still be entirely in the outside air. The facility afforded for inspection, and the general tendency which even the less enthusiastic have to keep clean the outside which shows, would prove valuable advantages of this plan.†

* Compare Plate V. with Plates VI. and VIII.

† See Plates VI. and VIII.

A bathroom for every cottage is an ideal which some day will surely come to be regarded as essential. In small tenements where the cost of this ideal may still be prohibitive, there seems no reason why there should not be provided at least a bathroom to each quadrangle. One of the great advantages of substituting open courts for narrow streets would be the ease with which some little corporate feeling might be fostered in them. In municipal housing schemes, which spring from the co-operative effort of the whole town or city, it would seem specially fitting that something should be done to foster associated action among the tenants.

And this is the more urgent because it is only by such association that we can hope to provide for the many some of the most desirable conveniences of life which wealth now enables the few to secure for themselves individually. We have already pointed out what advantage would arise from the associated use and enjoyment of the small plots of land which are all that can be given to each cottage. It has been found quite practicable in very many flat-dwellings to have a considerable amount of associated usage of wash-houses, sculleries, drying-grounds, etc., even among the most unenlightened tenants. There is no reason why the same arrangement should not be made with cottages. Quadrangles lend themselves peculiarly to the provision of small laundries, baths, reading-rooms, and other such simple and easily managed co-operative efforts.

A well-fitted wash-house having a plentiful supply of hot and cold water laid on to all the tubs, a proper washing and wringing machine, and a heated drying closet, is out of the reach of even the well-to-do cottager. But there is no reason why one or two such should not be provided for each court of houses; no reason why every little scullery should be blocked up with inadequate washing appliances; why every woman should have to spend a whole day toiling at the weekly wash which she could do with less labor in an hour or two if she had the use of proper apparatus; or why every living-room should be encumbered with clothes-horses or made uncomfortable with steam.* The capital cost that would be saved by not providing space for, and fitting, washing appliances in all the sculleries, would pay for the one co-operative wash-house. And a very small addition to the rent would allow for the provision of hot water and heat for drying. To such a laundry should be attached a small room divided from

it by a glazed screen, where little children could play under the mother's observation. The want of such a place prevents many a mother from using a public laundry, as also does the distance from home, and the necessity of conveying clothes to and fro through the public streets, objections which would not be present in the case of the quadrangle with its small laundry. One

or two baths, heated from the same source, could be provided; and it might be found possible to lay on a hot water supply to each cottage from the same centre. This has been done by the Liverpool Corporation in their Dryden-

* See Plate VIII.

street houses, where a constant supply of hot water is provided to every sink at a charge of twopence per week to each tenement. This arrangement would greatly simplify the problem of providing baths to each house, as it would save the cost of the separate hot water installations. It is very desirable that a bath should have hot water attached, but one with cold water only is a great advance on none at all; and, in plans for artisans' houses, every alternative arrangement should be well considered, and every effort made to provide a bath of some sort. A bath-room adjacent to the scullery, or even a bath placed in the scullery, may sometimes be contrived when space on the bedroom floor is out of the question. And there are several alternative arrangements for getting a supply of hot water from the copper or side boiler direct into the bath. Where, however, a bath-room to each house is out of the question, one or two baths could easily be worked in connection with the laundry.* Add to these a recreation or reading-room (also being tried at the Dryden-street houses) and there would be in each quadrangle a small co-operative centre, the attendance on which might easily be arranged to be undertaken by the tenant of the next cottage, for a small payment.

**Communal
Centre.**

Such a centre would, by associated effort, provide for each cottager many advantages which he could not hope to secure for himself by his individual effort, and all for the payment of a few pence per week extra rent. Beginning with the laundry and baths, the most necessary and well-tried items, such co-operative centres would undoubtedly grow, as experience taught the tenants the advantage of association in domestic work; the common-room to supply somewhat the place of the individual parlor, the bakehouse, and even the common kitchen would be matters only of time and the growth of self-restraint, and the co-operative spirit. As the communal centre grows in importance, it will begin to affect our architecture, forming a striking feature in each court and giving a more complete sense of unity to it. At some point it may become worth while to have a covered way from the cottages to the common rooms—care being taken, of course, to put this only where it will not shade any sun from the house. But this is, perhaps, wandering too far into the future, leaving the immediately possible for the ideally desirable. None the less, it is along these lines that we must look for any solution of the housing question in town suburbs which shall be satisfactory from the point of view of health and economy, and at the same time afford some opportunity for the gradual development of a simple dignity and beauty in the cottage, which assuredly is necessary, not only to the proper growth of the gentler and finer instincts of men, but to the producing of that indefinable something which makes the difference between a mere shelter and a home.

COMMUNISM

A LECTURE BY
WILLIAM MORRIS.

PUBLISHED AND SOLD BY
THE FABIAN SOCIETY.

PRICE ONE PENNY.

LONDON :
THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.
PUBLISHED MARCH 1903. REPRINT OCTOBER 1907.

EDITOR'S NOTE.

THE Fabian Society is indebted to the Trustees of William Morris for permission to include the following paper in its series of Tracts. It was written for delivery as a spoken address to the members of the Hammersmith Socialist Society in 1893. By that time Morris had acquired an intimate knowledge of the attempt to organize Socialism in this country which began in the early eighties. He had himself undertaken and conducted that part of the experiment which nobody else would face: namely, the discovery and combination, without distinction of class, of all those who were capable of understanding Equality and Communism as he understood it, and their organization as an effective force for the overthrow of the existing order of property and privilege. In doing so he had been brought into contact, and often into conflict, with every other section of the movement. He knew all its men and knew all their methods. He knew that the agitation was exhausted, and that the time had come to deal with the new policy which the agitation had shaken into existence. Accordingly, we find him in this paper doing what he could to economize the strength of the movement by making peace between its jarring sections, and recalling them from their disputes over tactics and programs to the essentials of their cause.

The Socialist agitation in Morris's time had divided itself into three clearly defined sections. His own section, organized as The Socialist League, broke down because there was only one William Morris. Those who combined any real understanding of his aims or his view of our commercial civilization with high personal character and practical ability were too few and far between to effect a political revolution. The other two sections survived. One of them, the Social-Democratic Federation, concerned itself very little with Morris's fundamental conceptions of Equality, Communism, and the rediscovery under Communism of Art as "workpleasure." It set itself frankly to organize the proletariat as a single class for the purpose of wresting the material sources of production from the hands of the proprietary class; or, in the well worn phrases of the older Social-Democrats, to make the workers "class-conscious" of themselves, and to organize "the class war." The third section was the Fabian Society, which aimed simply at the reduction of Socialism to a constitutional political policy which, like Free Trade or Imperial Federation or any other accepted parliamentary movement, could be adopted either as a whole or by instalments by any ordinary respectable citizen without committing himself to any revolutionary association or detaching himself in any way from the normal course of English life.

The Fabian project was, of course, enormously more acceptable to a timidly Conservative nation than its two rivals. It also called for a good deal of administrative knowledge and parliamentary ingenuity, and so selected automatically for its membership the politically clever and officially experienced Socialists. It is not sur-

prising, therefore, that the Fabians alone made any headway ; that the Socialist League was abandoned by Morris as a failure after a patient and laborious trial ; that the Independent Labor Party, a later formation, adopted parliamentary methods ; and that the Social-Democratic Federation, after keeping up the struggle for a declaration of the class war for years, had finally to choose between assimilating its methods to those of the Independent Labor Party and being crowded out of the field of Labor agitation.

It is unnecessary to say that Morris was from the first impatient of Fabianism as an essentially superficial movement. But he was fundamentally the most practical of all the Socialists. When he quarrelled with facts, he set to work at once to alter them. He was quite accustomed to be laughed at and explained away in a superior manner, both from the popular and the academic point of view. In all the arts and crafts which he had touched with his own hands, the laughter and the superior explanations had been hastily checked by the discovery that he had effected a revolution whilst his critics were idly chattering. But the same qualities which enabled him to alter unpleasant facts when he could, enabled him to face them when he could not. When he found after trying his hardest that the English people would not join the Socialist League or allow the Social-Democratic Federation to convince them that they belonged to an ungentlemanly class, he accepted the situation and considered how to make the best of it. His inevitable isolation as a man of genius was of course not less among avowed Socialists than elsewhere ; but it compelled all the sections to listen to him when they would not listen to one another ; and the Hammersmith Socialist Society, a faithful bodyguard surviving from the extinct Socialist League, provided for him within his own curtilage a platform on which every Socialist was proud to speak.

What he himself said to the sections from this platform will be found in the following pages. It gives his reasons for advising the other Socialists not to quarrel with the Fabians. And it gives his warning to the Fabians that it is one thing to formulate on paper a constitutional policy, and another thing to induce people to carry it out when the Equality and Communism to which it leads are abhorred instead of desired by them.

I must add a word of editorial explanation. It was Morris's habit, fortunately for posterity, to write his lectures at full length instead of trusting to extemporization. How he found time to write so many, even when he was reviving the lost art of fine printing in his spare time, I cannot imagine. He certainly did not find time to revise them. Besides, he seems to have had the Shakespearian habit of never blotting a line, perhaps as part of his general rule not to waste time in cobbling a bad job, but to do it over again. The manuscript consists of fourteen pages of white foolscap. There are words scored through and replaced by others before the ink was dry, but no reconstructions made on revision, a ceremony which was clearly never gone through. The last half of the paper must have been written against time in great haste : more words are left

out than in the earlier pages; and occasionally a sentence becomes a hopeless no-thoroughfare. The grammar, too, is hasty: the verb agrees with the nearest noun, which is not always its subject. The ands are sometimes written at full length, and sometimes indicated by anpersands, just as we have printed them. The spelling is for the most part conventional; but the s is always doubled in disappear and disappoint, and there is never more than one g in aggressive. The italics represent Morris's own underscoring. The punctuation is very hasty; but as the sense never depends on the position of a stop, I have altered or supplemented it freely for the sake of clearness. I have been very reluctant to meddle with the words; but on page 10, line 48, I have changed "anything" to "like everything"; the footnote on page 11 occurs in the manuscript as a rather obstructive parenthesis; on page 12, line 48, I have been Vandal enough to alter the characteristic phrase "their wealth—nay their riches" into "their wealth—or rather their riches" because I found that the "nay" in this passage conveyed to a typical reader the impression that Morris thought more of riches than of wealth (a misunderstanding which would almost bring him back from the grave to protest);* on page 14, line 4, I have altered "which doesn't involve" into "which will then no longer involve"; and on page 15, line 4, I have changed "as they are now and probably must be to be successful under the guidance of one man" to "as they are now (and, to be successful, must probably remain) under the guidance of one man." To Morris's friends, as to myself, these changes will seem mere imperinences; but others will find the meaning made clearer by the changes. At all events, those who are offended can correct their copies. The rest of the very few departures from the manuscript are only replacements of obviously dropped articles or prepositions, and need no apology. I believe that the words "of making" on page 11, line 5, should be "to make"; but I have not altered them, as such a change would affect the meaning. Finally, I may say that the back of the manuscript, which lay before Morris as he sat listening to the debate on the platform after his lecture, is adorned with decorations in pencil, which began, schoolboy fashion, with several arrows—not, it must be confessed, the clothyard shafts he describes in *A Dream of John Ball*, but fat, short, heavy-headed bolts for a medieval machine gun. Then comes a sort of fishing rod with Gothic crockets—or perhaps it is a conventionalized lily leaf. The rest is the familiar decoration of flower and scroll and leaf with which his hand was so often busy in idle moments. His notes of the discussion run as follows: "old age pensions—Mordhurst one road—means—luxury or necessity—opponent—come Bradlaugh—Bullock—workman."

Morris bibliographers should note that the title **Communism** is not distinctive of this lecture, as he used it on other occasions on the Hammersmith platform and elsewhere. G. B. S.

* See the paper on "Art, Wealth and Riches" in the volume of Morris's essays entitled *Architecture, Industry and Wealth* (London, 1902: Longmans; 6s. net).

Intelligence enough to Conceive, ~~power to compel~~ ^{enough} courage, to
will, power enough to Compel. If our ideas of a new
Society are any thing more than ^a dream, these three qualities
must animate the due effective majority of the working
people: and then, I say, the thing will be done

COMMUNISM.

WHILE I think that the hope of the new-birth of society is certainly growing, & that speedily, I must confess myself puzzled about the means toward that end which are mostly looked after now ; and I am doubtful if some of the measures which are pressed, mostly, I think, with all honesty of purpose, and often with much ability, would, if gained, bring us any further on the direct road to a really new-born society, the only society which can be a new birth, a society of practical equality. Not to make any mystery about it, I mean that the great mass of what most non-socialists at least consider at present to be socialism, seems to me nothing more than a *machinery* of socialism, which I think it probable that socialism *must* use in its militant condition ; and which I think it *may* use for some time after it is practically established ; but does not seem to me to be of its essence. Doubtless there is good in the schemes for substituting business-like administration in the interests of the public for the old Whig muddle of *laissez faire* backed up by coercion and smoothed by abundant corruption, which, worked all of it in the interest of successful business men, was once thought such a wonderful invention, and which certainly was the very cement of society as it has existed since the death of feudalism. The London County Council, for instance, is not merely a more useful body for the administration of public business than the Metropolitan Board of Works was : it is instinct with a different spirit ; and even its general *intention* to be of use to the citizens and to heed their wishes, has in it a promise of better days, and has already done something to raise the dignity of life in London amongst a certain part of the population, and down to certain classes. Again, who can quarrel with the attempts to relieve the sordidness of civilized town life by the public acquirement of parks and other open spaces, planting of trees, establishment of free libraries and the like ? It is sensible and right for the public to push for the attainment of such gains ; but we all know very well that their advantages are very unequally distributed, that they are gains rather for certain portions of the middle-classes than for working people. Nay, this socialist machinery may be used much further : it may gain higher wages and shorter working hours for the working men themselves : industries may be worked by municipalities for the benefit both of producers and consumers. Working-people's houses may be improved, and their management taken out of the hands of commercial speculators. More time might be insisted on for the

education of children ; and so on, and so on. In all this I freely admit a great gain, and am glad to see schemes tried which would lead to it. But great as the gain would be, the ultimate good of it, the amount of progressive force that might be in such things would, I think, depend on *how* such reforms were done ; in what spirit ; or rather what else was being done, while these were going on, which would make people long for equality of condition ; which would give them faith in the possibility and workableness of socialism ; which would give them courage to strive for it and labour for it ; and which would do this for a vast number of people, so that the due impetus might be gained for the sweeping away of all privilege. For we must not lose sight of the very obvious fact that these improvements in the life of the larger public can only be carried out at the expense of some portion of the freedom and fortunes of the proprietary classes. They are, when genuine, one and all attacks I say on the "liberty and property" of the non-working or useless classes, as some of those classes see clearly enough. And I admit that if the sum of them should become vast and deep reaching enough to give to the useful or working classes intelligence enough to conceive of a life of equality & co-operation ; courage enough to accept it and to bring the necessary skill to bear on working it ; and power enough to force its acceptance on the stupid and the interested, the war of classes would speedily end in the victory of the useful class, which would then become the new Society of Equality.

Intelligence enough to conceive, courage enough to will, power enough to compel. If our ideas of a new Society are anything more than a dream, these three qualities must animate the due effective majority of the working-people ; and then, I say, the thing will be done.

Intelligence, courage, power *enough*. Now that *enough* means a very great thing. The effective majority of the working people must I should think be something as great in numbers as an actual mechanical majority ; because the non-working classes (with, mind you, their sworn slaves and parasites, men who can't live without them) are even numerically very strong, and are stronger still in holding in their hand the nine points of the law, possession to wit ; and as soon as these begin to think there is any serious danger to their privilege—i.e., their livelihood—they will be pretty much unanimous in defending it, and using all the power which they possess in doing so. The necessary majority therefore of intelligence, courage, & power is such a big thing to bring about, that it will take a long time to do so ; and those who are working for this end must clearly not throw away time and strength by making more mistakes than they can possibly help in their efforts for the conversion of the working people to an ardent desire for a society of equality. The question then, it seems to me, about all those partial gains above mentioned, is not so much as to what advantage they may be to the public at large in the passing moment, or even to the working people, but rather what effect they will have towards

converting the workers to an understanding of, and ardent desire for Socialism ; true and complete Socialism I mean, what I should call Communism. For though making a great many poor people, or even a few, somewhat more comfortable than they are now, somewhat less miserable, let us say, is not in itself a light good ; yet it would be a heavy evil, if it did anything towards dulling the efforts of the whole class of workers towards the winning of a real society of equals. And here again come in those doubts and the puzzlement I began by talking about. For I want to know and to ask you to consider, how far the betterment of the working people might go and yet stop at last without having made any progress on the *direct* road to Communism. Whether in short the tremendous organization of civilized commercial society is not playing the cat and mouse game with us socialists. Whether the Society of Inequality might not accept the quasi-socialist machinery above mentioned, and work it for the purpose of upholding that society in a somewhat shorn condition, maybe, but a safe one. That seems to me possible, and means the other side of the view : instead of the useless classes being swept away by the useful, the useless classes gaining some of the usefulness of the workers, and so safeguarding their privilege. The workers better treated, better organised, helping to govern themselves, but with no more pretence to equality with the rich, nor any more hope for it than they have now. But if this be possible, it will only be so on the grounds that the working people have ceased to desire real socialism and are contented with some outside show of it joined to an increase in prosperity enough to satisfy the cravings of men who do not know what the pleasures of life might be if they treated their own capacities & the resources of nature reasonably with the intention and expectation of being happy. Of course also it could not be possible if there be, as we may well hope, an actual necessity for new development of society from out of our present conditions : but granting this necessity, the change may and will be exceedingly slow in coming if the working people do not show their sense of the necessity by being overtaken by a longing for the change & by expressing that longing. And moreover it will not only be slow in coming but also in that case it can only come through a period of great suffering & misery, by the ruin of our present civilization : and surely reasonable men must hope that if the Socialism be necessary its advent shall both be speedy & shall be marked by the minimum of suffering and by ruin not quite complete. Therefore, I say, what we have to hope for is that the inevitable advance of the society of equality will speedily make itself felt by the consciousness of its necessity being impressed upon the working people, and that they will consciously and not blindly strive for its realization. That in fact is what we mean by the education into Socialism of the working classes. And I believe that if this is impossible at present, if the working people refuse to take any interest in Socialism, if they practically reject it, we must accept that as a sign that the necessity for an essential change in society is so far distant, that we need scarcely trouble ourselves

about it. This is the test ; and for this reason it is so deadly serious for us to find out whether those democratic tendencies & the schemes of new administration they give birth to are really of use in educating the people into *direct* Socialism. If they are not, they are of use for nothing else ; and we had best try if we can't make terms with intelligent Tories and benevolent Whigs, and beg them to unite their intelligence and benevolence, and govern us as kindly and wisely as they can, and to rob us in moderation only. But if they are of use, then in spite of their sordid and repellent details, and all the sickness of hope deferred that the use of such instruments assuredly brings us, let us use them as far as they will go, and refuse to be disappointed if they will not go very far : which means if they will not in a decade turn into a united host of heroes and sages a huge mass of men living under a system of society so intricate as to look on the surface like a mere chance-hap muddle of many millions of necessitous people, oppressed indeed, and sorely, not by obvious individual violence and ill-will, but by an economic system so far reaching, so deeply seated, that it may well seem like the operation of a natural law to men so uneducated that they have not even escaped the reflexion of the so-called education of their masters, but in addition to their other mishaps are saddled also with the superstitions and hypocrisies of the upper classes, with scarce a whit of the characteristic traditions of their own class to help them : an intellectual slavery which is a necessary accompaniment of their material slavery. That as a mass is what revolutionists have got to deal with : such a mass indeed I think could and would be vivified by some spark of enthusiasm, some sudden hopeful impulse towards aggression, if the necessity for sudden change were close at hand. But is it ? There are doubtless not a few in this room, myself perhaps amongst them (I say *perhaps* for one's old self is apt to grow dim to one)—some of us I say once believed in the inevitableness of a sudden and speedy change. That was no wonder with the new enlightenment of socialism gilding the dulness of civilization for us. But if we must now take soberer views of our hopes, do not reproach us with that. Remember how hard other tyrannies have died, though to the economical oppression of them was added obvious violent individual oppression, which as I have said is lacking to the heavy tyranny of our times ; and can we hope that it will be speedier in its ending than they ? I say that the time is not now for the sudden kindling of the impulse of direct aggression amongst the mass of the workmen. But what then ! are we to give up all hope of educating them into Socialism ? Surely not. Let us use all means possible for drawing them into socialism, so that they may at last find themselves in such a position that they understand themselves to be face to face with false society, themselves the only possible elements of true society.

So now I must say that I am driven to the conclusion that those measures I have been speaking of, like everything that under any reasonable form does tend towards socialism (present conditions being understood) *are* of use toward the education of the great mass

of the workers ; that it is necessary in the present to give form to vague aspirations which are in the air about them, and to raise their aims above the mere businesslike work of the old trades unions of raising wages with the consent (however obtained) of the employers ; of making the workers see other employers* than those who live on the profit wrung out of their labour. I think that taking up such measures, directly tending towards Socialism, is necessary also in getting working people to raise their standard of livelihood so that they may claim more and yet more of the wealth produced by society, which as aforesaid they can only get at the expense of the non-producing classes who now rob them. Lastly, such measures, with all that goes towards getting them carried, will train them into organisation and administration ; and I hope that no one here will assert that they do not need such training, or that they are not at a huge disadvantage from the lack of it as compared with their masters who have been trained in these arts.

But this education by political and corporate action must, as I hinted above, be supplemented by instilling into the minds of the people a knowledge of the aims of socialism, and a longing to bring about the complete change which will supplant civilization by communism. For the Social-democratic measures above mentioned are all of them either make-shift alleviations to help us through the present days of oppression, or means for landing us in the new country of equality. And there is a danger that they will be looked upon as ends in themselves. Nay it is certain that the greater number of those who are pushing for them will at the time be able to see no further than them, and will only recognise their temporary character when they have passed beyond them, and are claiming the next thing. But I must hope that we can instil into the mass of people some spirit of expectation, however vague, beyond the needs of the year ; and I know that many who are on the road to socialism will from the first and habitually look toward the realization of the society of equality, & try to realise it for themselves—I mean they will at least try to think what equality will turn out to be, and will long for it above all things. And I look to this spirit to vivify the striving for the mere machinery of Socialism ; and I hope and believe that it will so spread as the machinery is attained that however much the old individualist spirit may try to make itself master of the corporate machinery, and try by means of the public to govern the public in the interests of the enemies of the public, it may be defeated.

All this however is talking about the possible course of the Socialist movement ; but since, as you have just heard, it seems to me necessary that in order to make any due use of socialist machinery one should have some sort of idea as to the life which is to be the result of it, let me now take up the often told tale of what we mean by communism or socialism ; for between complete Socialism and Communism there is no difference whatever in my

* The public to wit, i.e., the workers themselves in their other position of consumers.

mind. Communism is in fact the completion of Socialism : when that ceases to be militant & becomes triumphant, it will be communism.

The Communist asserts in the first place that the resources of nature, mainly the land and those other things which can only be used for the reproduction of wealth and which are the effect of social work, should not be owned in severalty, but by the whole community for the benefit of the whole. That where this is not the case the owners of these means of production must of necessity be the masters of those who do not own a sufficiency of them to free them from the need of paying with a portion of their labour for the use of the said means of production ; and that the masters or owners of the means of production do practically own the workers ; very practically, since they really dictate to them the kind of life they shall lead, and the workers cannot escape from it unless by themselves becoming owners of the means of production, i.e. of other men. The resources of nature therefore, and the wealth used for the production of further wealth, the plant & stock in short, should be communized. Now if that were done, it would at once check the accumulation of riches. No man can become immensely rich by the storing up of wealth which is the result of the labour of his own brain and hands : to become very rich he must by cajolery or force deprive others of what their brains or hands have earned for them : the utmost that the most acquisitive man could do would be to induce his fellow citizens to pay him extra for his special talents, if they specially longed for his productions. But since no one could be very rich, and since talent for special work is never so very rare, and would tend to become less rare as men were freer to choose the occupations most suitable for them, producers of specialities could not exact *very* exorbitant payment, so that the aristocracy of talent, even if it appeared, would tend to disappear, even in this first state of incomplete Communism. In short there would be no very rich men : and all would be well off : all would be far above the condition of satisfaction of their material necessities. You may say how do I know that ? The answer is because there could not be so much waste as there is now. Waste would tend to disappear. For what is waste ? First, the causeless destruction of raw material ; and secondly, the diverting of labour from useful production. You may ask me what is the standard of usefulness in wares ? It has been said, and I suppose the common view of that point is, that the price in the market gives us the standard ; but is a loaf of bread or a saw less useful than a Mechlin lace veil or a diamond necklace ? The truth is that in a society of inequality, a society in which there are very rich people and very poor ones, the standard of usefulness is utterly confused : in such a society the market price of an article is given us by the necessities of the poor and the inordinate cravings of the rich ; or rather indeed *their* necessity for spending their wealth—or rather their riches—somehow : by no means necessarily in pleasure. But in a society of equality the demand for an article *would* be a standard of its usefulness in one way or other. And it

would be a matter of course that until every body had his absolute necessities and his reasonable comforts satisfied, there would be no place for the production of luxuries; and always labour would be employed in producing things that people (all the people, since classes would have disappeared) really want.

Remember what the waste of a society of inequality is: 1st: The production of sordid makeshifts for the supply of poor folk who cannot afford the real article. 2nd: the production of luxuries for rich folk, the greater part of which even their personal folly does not make them want. And 3rdly: the wealth wasted by the salesmanship of competitive commerce, to which the production of wares is but a secondary object, its first object being the production of a profit for the individual manufacturer. You understand that the necessary distribution of goods is not included in this waste; but the endeavour of each manufacturer to get as near as he can to a monopoly of the market which he supplies.

The minimization of waste therefore, which would take place in the incomplete 1st stages of a society of equality—a society only *tending* to equality—would make us wealthy: labour would not be wasted: workmen would not be employed in producing either slave wares, or toys for rich men: their genuine well made wares would be made for other workmen who would know what they wanted. When the wares were of such a kind as required very exquisite skill and long training to produce, or when the material used was far fetched and dear bought, they would not cease to be produced, even though private citizens could not acquire them: they would be produced for the public use, and their real value be enormously increased thereby, and the natural and honest pride of the workman duly satisfied. For surely wealthy people will not put up with sordid surrounding or stinginess in public institutions: they will assuredly have schools, libraries, museums, parks and all the rest of it real & genuine, not makeshifts for such things: especially as being no longer oppressed by fears for their livelihood, and all the dismal incidents of the battle for mere existence, they will be able to enjoy these things thoroughly: they will be able in fact to use them, which they cannot do now. But in all I have been saying about this new society hitherto I have been thinking I must remind you of its inchoate and incomplete stages. The means of production communized but the resulting wealth still private property. Truth to tell, I think that such a state of things could only embrace a very short period of transition to complete communism: a period which would only last while people were shaking down into the new Society; for if there were no poor people I don't see how there could be any rich. There would indeed be a natural compulsion, which would prevent any man from doing what he was not fitted for, because he could not do it usefully; and I need not say that in order to arrive at the wealth I have been speaking of we must all work usefully. But if a man does work usefully you can't do without him; and if you can't do without him you can only put him into an inferior position to another useful citizen by means of com-

pulsion; and if you compel him to it, you at once have your privileged classes again. Again, when all people are living comfortably or even handsomely, the keenness of the strife for the better positions, which will then no longer involve a life of idleness or power over ones neighbours, will surely tend to abate: men get rich now in their struggles not to be poor, and because their riches shield them from suffering from the horrors which are a necessary accompaniment of the existence of rich men; e.g., the sight of slums, the squalor of a factory country, the yells and evil language of drunken and brutalized poor people & so forth. But when all private life was decent and, apart from natural accident, happy; and when public institutions satisfied your craving for splendour and completeness; and when no one was allowed to injure the public by defiling the natural beauty of the earth, or by forbidding mens cravings for making it more beautiful to have full sway, what advantage would there be in having more nominal wealth than your neighbour? Therefore, as on the one hand men whose work was acknowledged as useful would scarcely subject themselves to a new system of caste; and, on the other, people living happily with all their reasonable needs easily satisfied would hardly worry themselves with worrying others into giving them extra wealth which they could not use, so I think the communization of the means of industry would speedily be followed by the communization of its product: that is that there would be complete equality of condition amongst all men. Which again does not mean that people would (all round) use their neighbours coats, or houses or tooth brushes, but that every one, whatever work he did, would have the opportunity of satisfying all his reasonable needs according to the admitted standard of the society in which he lived: i.e., without robbing any other citizen. And I must say it is in the belief that this is possible of realization that I continue to be a socialist. Prove to me that it is not; and I will not trouble myself to do my share towards altering the present state of society, but will try to live on, as little a pain to myself and a nuisance to my neighbour as I may. But yet I must tell that I shall be more or less both a pain to myself (or at least a disgrace) and a nuisance to my neighbour. For I do declare that any other state of society but communism is grievous & disgraceful to all belonging to it.

Some of you may expect me to say something about the machinery by which a communistic society is to be carried on. Well, I can say very little that is not merely negative. Most antisocialists and even some socialists are apt to confuse, as I hinted before, the co-operative machinery towards which modern life is tending with the essence of socialism itself; and its enemies attack it, and sometimes its friends defend it on those lines; both to my mind committing a grievous error, especially the latter. E.g. An anti-socialist will say How will you sail a ship in a socialist condition? How? Why with a captain and mates & sailing master and engineer (if it be a steamer) and ABs and stokers & so on and so on. Only there will be no 1st 2nd and 3rd class among the passengers: the

sailors & stokers will be as well fed & lodged as the captain or passengers ; and the Captain and the stoker will have the same pay.

There are plenty of enterprizes which will be carried on then, as they are now (and, to be successful, must probably remain) under the guidance of one man. The only difference between then and now will be, that he will be chosen because he is fit for the work, & not because he must have a job found for him ; and that he will do his work for the benefit of each and all, and not for the sake of making a profit. For the rest, time will teach us what new machinery may be necessary to the new life ; reasonable men will submit to it without demur ; and unreasonable ones will find themselves compelled to by the nature of things, and can only I fear console themselves, as the philosopher did when he knocked his head against the door post, by damning the Nature of things.

Well, since our aim is so great and so much to be longed for, the substituting throughout all society of peace for war, pleasure and self-respect for grief and disgrace, we may well seek about strenuously for some means for starting our enterprise ; and since it is just these means in which the difficulty lies, I appeal to all socialists, while they express their thoughts & feelings about them honestly and fearlessly, not to make a quarrel of it with those whose aim is one with theirs, because there is a difference of opinion between them about the usefulness of the details of the means. It is difficult or even impossible not to make mistakes about these, driven as we are by the swift lapse of time and the necessity for doing something amidst it all. So let us forgive the mistakes that others make, even if we make none ourselves, and be at peace amongst ourselves, that we may the better make War upon the monopolist.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. Paper cover, design by A. G. Watts. 3d., post free 4d.; 2/3 per doz., post free, 2/7.

FABIANISM AND THE EMPIRE: A Manifesto. 1s. post free.

FABIAN ESSAYS IN SOCIALISM. (43rd Thousand.)

Paper cover, 1/-; plain cloth, 2/-, post free from the Secretary.

FABIAN TRACTS and LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 81, 3s.; post free 3 5. Bound in Buckram, 4/6; post free for 5s.

I.—General Socialism in its various aspects.

TRACTS.—121. Public Service versus Private Expenditure. By Sir OLIVER LODGE. 113. Communism. By WM. MORRIS. 107. Socialism for Millionaires. By BERNARD SHAW. 133. Socialism and Christianity. By Rev. PERCY DEARMER. 78. Socialism and the Teaching of Christ. By Dr. JOHN CLIFFORD. 87. The same in Welsh. 42. Christian Socialism. By Rev. S. D. HEADLAM. 79. The Secret of Rural Depopulation.

A paper read to the Fabian Society on February 26th, 1904.

THE question "Why do I stay where I am?" is one that interests all of us. Its answers range between that of Sterne's starling with the simple "I can't get out" and that of the happy few who can say "It is well for us to be here." But most people who are what in the country we call "fixters" have to confess that they are the prisoners of habit. The more regular our life the harder it is to break away from its rule.

Now of all occupations that of the tiller of the soil is perhaps the most regular. He is hitched on to the zodiac. Every action of his working life is as recurrent as the seasons themselves. Ploughing is a step towards ploughing, sowing is a step towards sowing again. And so it goes round. The son of a field laborer, in the ordinary course of things, goes to field work as soon as the school will let him. By the time he is getting "man's money" he has little volition left. Habit has taken its place. The odds would seem to be long in favor of his remaining a field laborer for the term of his natural life.

But there is something more than habit to fasten him to the land. By the time he is sixteen he is specialized for field work. That is the only skilled labor for which he will ever be fit. Off the land he is only so much horse-power. He can dig—under direction—in a drain, or he can carry bales at the docks. He is past learning another craft. He is moored head and stern to the land by two hawsers, habit and hopelessness.

And yet his breaking away from the land is becoming so common as to constitute a national danger. Why is this? We must go back, I think, to a period before rustic unrest began distinctly to take the form of escape.

The Fauna of the Country.

Up to some thirty odd years ago agricultural laborers were regarded as a quite permanent factor in the sum of English life. They were part of the *fauna* of the country—like pheasants and partridges; only there is no getting a good head of game without preserving, and there was no need to preserve country laborers. Sergeant Kite was almost the only poacher to be feared, and the toll he took was trifling. Now and then typhus or an emigration agent would descend upon a village, and a cottage would be empty for a month or so. But that was only a momentary inconvenience to an individual employer. The real difficulty was not how to breed laborers, like pheasants, but how to keep down their numbers, like rabbits. No more cottages were allowed upon an estate than would just supply roofage to the laborers it employed. Increase was not

allowed for. Infant mortality was high. Overcrowding and sanitary neglect did their work. Semi-starvation helped. Still, however, the supply of labor exceeded the demand. Those were the days in which a great farmer is said to have offered a friend a guinea if he could find a weed in his wheat-field. With men's wages at six or seven shillings a week, women glad to take what they could get for field work, and corn at 50s. a quarter, the land could be well "done," as they say. The employer could be well "done," too. A great agriculturist's recollections of about this period were published a few years ago. They were a record of good living, *menus* of dinners, reminiscences of hunting breakfasts, conversations with admiring noblemen. "Hey, the green holly. This life is most jolly," ought to have been the motto of the book. The world went very well then—with squires and farmers.

I do not think the idea of what we call a "rural exodus" occurred seriously to anyone before the early seventies. There was the land, and that there should be men to till it seemed a law of nature.

That the men might possibly one day turn their backs on the land in sufficiently large numbers to seriously inconvenience squires and farmers generally—this idea never entered the head of the average employer. Where were they to go? The land of Egypt, the house of bondage, was pretty secure in the deserts and seas that surrounded it. The prison was hard to break.

Looking at the wages and the housing of the laborer in those days, it really seems as though physical laws were all that prevented the process of degradation and deprivation of which he was the victim from being continued indefinitely. Men cannot work unless they eat—something. The proverbial straw a day had very nearly been reached. Out of English countrymen, the descendants of the men who rose in arms with Wat Tyler and Jack Cade, had been evolved by the sheer greed and selfishness of squires and farmers, a race so reduced by long continued starvation and oppression that they seemed, generally, as incapable of resistance as their tyrants were, generally, incapable of ruth. "Hunger will tame a lion," says Robinson Crusoe. The British farmer put the maxim to proof.

Froissart called the English common people of his day the haughtiest and most overweening that the world could show. That was in the fourteenth century. This is what Joseph Arch said at the end of the nineteenth: "I had seen my brother laborers stand and tremble like an aspen leaf at the dark look of the employer simply because they had not the pluck of men." You may see the same thing to-day. Nothing is sadder than the abjectness of the laborer before the scowl of his master.

The laborer who was to be hanged the other day and who said "Thank ye, sir," to Jack Ketch on his adjusting the rope is a fair instance of the attitude of his class to any Jack-in-office or authority. They are descended from generations of half-starved parents, and they show "the mettle of their pasture."

The farmer seemed to have done his work thoroughly. He had produced what he wanted, a submissive drudge who cost little, did his work and gave no trouble whatever. The laborer's hand had not yet lost its cunning.

In the Days of the Corn Laws.

The work was done and done well. The farmers ate, drank and enjoyed themselves. That the laboring population had any "rights" as against the "masters" was a notion dismissed with contempt as part of the professional agitator's stock-in-trade. "The country" meant the landlord and the farmer. When we think of Athens in the days of Pericles, we hardly give a thought to the slave population. They are below the notice of history. And so it practically was with our rural laborers until the days of the Agricultural Laborers' Union. The Church knew them as "the poor." To the employers they were "the men." Charles Kingsley, in *Alton Locke*, gives a vivid description of an agricultural riot, its aimless despair, its impotent violence. I have here a reprinted report of a more peaceful demonstration in 1846. It is sad reading. But there is nothing in it to frighten anybody. The word "rising" cannot be applied to these pitiful wriggings of the great invertebrate earth-worm upon which the classes then recognized as England were so light-heartedly treading. Its head was never reared to strike. Its demonstrations demonstrated nothing but its own feebleness. The repeal of the Corn Laws left the laborer morally much where he was. Bread was cheaper, but the hand of the employer was perhaps heavier than before. From 1855 to the days of Joseph Arch was perhaps as black a time as any the laborers had to pass. The price of wheat was high, the squires raised their rents, the farmers recouped themselves by cutting down wages. The prosperity of squires and farmers was thus squeezed out of the already abject poverty of the poor. Any appearance of discontent was sternly repressed. To quote the words of a great agricultural authority, "It was a state of things disgraceful to all concerned." *Except* to laborers, I think. But it created no commotion. The Church, represented in every country parish, raised no protest. The parson had long ceased to be the "persona" of his flock. He thought more of the hurdles than of the sheep, as they say. The souls of squires and farmers *rotted* in the cradle of an easy conscience. They were good Churchmen to a man. Then, all at once, a bolt from the blue, came

The Agricultural Laborers' Union.

I need not dwell upon the history of that great movement. Opposed though it was by the landed interest in every form, denounced by too many of the country clergy and unhelped by the rest, it went on triumphantly until it had raised agricultural wages almost throughout the whole of England to a point at which the existence of the laborer was no longer *intolerable*. That much obtained, it collapsed. It is a remarkable instance of a great rising against long-endured oppression which contented itself with a bare rectification of the immediate wrong complained of. There was no violence, no resentment. This was undoubtedly due in great measure to the personal character and influence of the leader of the movement, Joseph Arch, a man of whom it is impossible to think without gratitude and respect. But it is no less true that the moderation shown by the men, both in their struggle and their success, argues a

certain want of resilience which testifies to the extent to which the fire and vigor of the race had been sapped by long-continued semistarvation and enforced submission to petty tyranny. The Agricultural Union did not, I think, appreciably raise the laborer; it only raised his wages. Instead of calling up a spirit of independence like that which animated the leader (a man, we must remember, born and bred in a cottage the property of his father, not of his employer), it left them generally, although materially better off, individually as submissive and as incapable of assertion of their personal rights as they had been through long generations of practical serfdom.

But the apathy of their hopelessness had been disturbed. The employers' difficulty had been the emigration agents' opportunity, and the plethora of labor had been relieved by the departure of a large percentage of the agricultural population. When the smoke of the struggle cleared off it was quite obvious that horizons had widened. Young men who dared not defy the arrogance of their employers found courage enough to escape from it to the railways or the towns. In this way the best young blood kept gradually draining away. The process has been steadily going on since.

The best men go. Laboring parents plot escape for their boys from the land as if they were prisoners in an enemy's country. Nobody stays of choice. You may hear former farm laborers speak of their late employers as a seventeenth century mariner might have spoken of the Moors of Tangiers, among whom he had been a captive.

Is the Laborer in Fault?

It has been said by a vigorous clerical writer that the laborer's discontent is merely a survival from the "bad, old, black past," when he really had something to complain of. All that has long gone by. It is the laborer's "evil temper" that still "provokes masters to harsh measures, harsh words, driving, and all such seemingly needless regulations as the command to keep no fowls or pigs, the tied cottages, and the domineering tone." All this is the laborer's fault, says the writer. Things are not now as they were in the times when "laborers were scornfully trampled on—and when the Church, cowed and faithless, was as little inclined as the State to help their condition." All that is gone by. Farmers and parsons have undergone a wonderful change. Like the Homeric hero they "boast that they are a great deal better than their fathers." But the laborer is bad indeed. The characteristics of the laborer are "shirking, dishonesty and negligence." "Tom, Dick and Sam abuse their employer, sit under the hedge when he is out of sight, steal his corn and meal, leave his horses harnessed and go off drinking, teach him that they have no love or gratitude, but only fear." The coloring suggests the moral complexion of a chain-gang. He might have adopted the words which Mr. Sam Weller in *Pickwick* puts into the mouth of a "virtuous clergyman." "He's a malicious, bad-disposed, worldly-minded, spiteful, windictive creetur, with a hard heart as there ain't no soft'nin."

Our "virtuous clergyman" in this case pronounces the rural villages to be in a state of utter decay, and exhorts us to build our hopes for the future entirely upon the progress of our urban population. Villages and villagers are played out.

Well, I dissent entirely. I am no believer in sudden and unintelligible changes. Farmers are much what they were sixty years ago. Clergymen are not so very different. The cut of their coats is altered, that is about all. Their intentions are as good as ever and the influence they exert exactly as bad, as far as the independence and manliness of their poor parishioners is concerned. And the laborer is what these have made him. He is still, as he has so long been, like an eel on an eel spear. He can wriggle, but that is about all. Until he is set free we can't expect anything very great of him in the way of moral improvement. But his good qualities are only dormant, held in abeyance till the winter of his discontent is made glorious summer by the sun of—Land Reform. At any rate, whatever he is, it is the social and economical system of England that has made him so. He has been crushed under an intolerable pressure, and until that is removed we must expect his faults to be of the grovelling sort. Give him opportunity and he will be erect, and his faults will probably be what they were in Froissart's time.

How the Laborer Lives.

Let us give one comprehensive glance to the conditions under which the laborer mostly lives, and under which some people expect him to cultivate all the Christian graces. A miserable cottage which as a tenant-at-will he can only repair or improve at the risk of his outlay in labor or in money being appropriated by his employer, a life of constant hardship, wages even now barely sufficient for food, fire and clothing, the proud man's contumely, the want of hope, the long vista of thankless drudgery through which the eye looks only to rest finally upon the workhouse, the absence of anything like social enjoyment, the tyranny of drink, the capricious restrictions upon personal liberty of action which his employer may at pleasure impose, and to which he must submit or go. It is a gloomy picture.

The strange thing is that up to so comparatively recent a time Englishmen should have accepted a life like this, a life still worse than this, as their natural doom, exactly as an Esquimaux may submit unrepiningly to the rigors of an Arctic climate. An Esquimaux wants more seals; ice and snow and darkness are matters of course. So Joseph Arch's men wanted more wages, they had no dislike to their occupation or the hardships inseparable from it. The best of them had doubtless the same pride and pleasure in their work which every skilled craftsman finds in the exercise of his skill. A great change has passed over the laborer in this respect. Tillage in all its branches appears to most of them sheer drudgery, absolutely uninteresting if not positively hateful. No mere rise of wages will alter this.

Skilled Labor and Farm Wages.

I do not think I can put this more forcibly before you than by condensing here a conversation I had a month or two ago with a man of the highest farming class, engaged in the management of one of those immense farms which seem to me to be the ruin of England.

It was a very favorable specimen. The management was evidently liberal, the owner, I believe, personally kindly. But the system was

too strong. On this great farm the piecework principle was in force. "So if a man wastes his time, he wastes what is his own," said my informant. The scale of pay was high for the district. "With these wages the men save, I suppose?" I said. "No, never. It goes as it comes. The men who get most don't live more comfortably than the others." "Do they take much interest in the work?" "Not the very slightest. If it were not for the piecework plan we might as well give up." "Are the men who are now in their prime as skilled in their work as the old men used to be?" "There is no comparison." He referred to an old laborer who possessed nine arts. I will count them up. Hedging and ditching (in two varieties), dry fence making, rick building, thatching, hurdle making, sheep-cage making, mowing, brewing. "You have no laborer who can do the same now?" "No, not one of them." "You mean no one man can do all?" "I mean that there is not a man on the farm who can do *one* of these things as it ought to be done."

Now, what is the reason of this? The general answer is "education." Education has something to do with it, doubtless. But let me read what Professor Thorold Rogers wrote in 1878 on the subject of rustic arts. He enumerates five or six, including ploughing, which I have omitted as too universal for special mention.

And he sums up thus: "Well, if you compare the work of the agricultural laborer who possesses the five or six qualifications I have mentioned with the work of an ordinary artisan who receives 35s. a week, the agricultural laborer, as regards the varied nature of his accomplishments, is inconceivably the superior of the artisan." I think we must add to this that the field hand is more exposed to wind and weather than the artisan. His life is a harder one. I have known men who lately have never had a dry stitch on them from Monday morning to Saturday night.

Now, let us suppose a farm hand to have mastered half a dozen of these arts. On the land he is *lucky* if he gets 18s. or 16s. a week, all counted. If he gets "on the line," the railway, just with pick and spade, he gets 18s. or 20s. What encouragement is there for a laborer to learn his craft? Again. The other day, in the village where I live, there was a little semi-political meeting, held by some working men from a neighboring town. It was a lively little business enough. But few laborers came. There was a largish group of farm hands at the door just before the speaking began. Someone, I was told, asked them if they were not coming in. "Well," says one, "we've been thinking it over. But if we come in we shall hear of it to-morrow from the master." So they went off. The yoke is never for a moment off the agricultural laborer's neck. I daresay the ganger looks after the platelayers on the line at their work sternly enough. But when a man shoulders his pick and goes home he is his own man. And that is what a farm hand never can say. Perhaps education may have helped him to feel it.

Why do men dislike farm labor? How is it possible that they should like it? Here is an occupation in which skill brings no reward, which marks a man quite early in life with an ineffaceable brand of social inferiority, which compels submission in a way almost unknown to any other, which offers no hope and does not even

promise permanence enough for habit to go to work assuredly in the task of accommodating existence to its conditions.

All this explains discontent. But it does not explain why up to some thirty years ago the sort of discontent with which we now have to deal should apparently not have existed.

Education may have something to do with it. Even what a lad learns at the village school does to a certain extent develop his imaginative faculties: and imagination is like a kite. The stronger it flies the more it pulls its flyer after it. But personal contact with men from the outer world has done more. Modern ideas are introduced, not by the schoolmaster, but by the tramp, and the traveller and the tallyman. The laborer sees himself through their eyes. And, what is more, *he sees his master*. The conditions under which he labors are degrading. This is strangely brought home to him by comparison of his position with that of others. And he confounds the labor with the conditions. A country laborer's great ambition is to disguise his occupation. As far as he can he dresses like a townsman, and wishes to be taken for one.

I lately read a book called *Mendip Annals*, an account by Mrs. Hannah More's sister of the good work done in Somerset by those two plucky old ladies just a hundred years ago. Comparing the ordinary farmer as he is there depicted with Charles Kingsley's references to him in the forties, with what the condition of his laborers showed him to be in the fifties, with Joseph Arch's account of him in the seventies, and with what I have myself gathered from laborers and personal observation of his general character since, I should say that he had undergone less change in the course of the century than perhaps any other class of Englishman. A writer in *Longman's*, commenting upon Mr. Rider Haggard's *Farmer's Year*, says that the schools to which farmers' sons go very often do not teach them as much as the village school teaches the laborers' boys. It is hard to believe, I grant, but the tradition of class superiority is kept up in all its vigor in the farmhouse. The little Spartan, well taught or not, is reared up in the contempt of the little Helot. The consequence is that class characteristics survive in a curious way. The ordinary non-working farmer (there are, of course, exceptions) belongs to the period of Parson Trulliber and Squire Western. He has stood still. The laborer has reached a point from which he can, inarticulately, criticize his master. And he does. Enquire why a man leaves his place. The answer varies in form, but is generally the same in substance. "He couldn't stand the way Mr. So-and-so goes on."

Now how does Mr. So-and-so go on? If we can get a clear idea of him we shall be on the way to an explanation of laboring discontent.

The Modern Farmer.

A century or so ago England was still the land of "characters." Uncle Toby and Lieutenant Lismahago, Commodore Trunnion and Parson Adams were popular in fiction because they were familiar in fact. The closer association of modern times has rounded off our angles into a somewhat distressing uniformity. We are too much afraid of one another not to straighten out the crooks in our natures

before a bend becomes a distortion. We show little mercy to eccentricity unless it has a powerful backer, wealth or rank or talent. People who live in a crowd learn to keep their elbows to themselves. In farming society there is elbow room and to spare. We all know the merchant skipper according to Clark Russell and Frank Bullen, and we understand that the conditions of seafaring life naturally evolve him, that any man in that position will have to fight a battle with himself not to become a brute. It is the same thing with the farmer. He is not so completely isolated as the skipper, the law is more present to him, his men are not so completely at the mercy of his temper. Self-indulgence in food and drink is qualified by the presence of his family; though very nearly, he is not entirely beyond the reach of public opinion. But the conditions of his life are such as to make him a petty tyrant unless he is superior enough to shape and fashion it for himself. Public opinion that keeps most of us on our legs, will give him no help in this. And a petty tyrant he generally is. As long as he keeps within the law he need not fear the cold shoulder among his fellows. "A man mustn't be unneighborly," they say. Now if there is one thing established by rural practice it is that farmers are farmers' neighbors. Laborers do not stand to them in that relation. Class charity covers a multitude of sins.

The non-working farmer is like Nora Creina in the song. His beauties are free "to sink or swell as Nature pleases." They mostly swell. He is under little extraneous restraint, and intellectual self-repression belongs to an intellectual level that he has not reached. We are all subject to attacks of temper. These are suppressed by a feeling of intellectual shame. It is this which mostly prevents passing irritation from hardening into petty spite. Now for a farmer to lose his temper seems to him and his class the most natural thing in the world. "Spite" is constantly looked for as a motive in rural matters, and pretty generally found.

Rural Spite.

I must give instances. You will ask, "How do you know them to be true?" Some, of course, are taken from reports of magisterial proceedings, or the like. For others, I can only say I believe them and I know them to be believed among the people whom they concern. What is believed to be fact does, morally, the work of fact. That is enough for my immediate purpose.

Here is one. Two elderly laborers had given offence to some farming magnates before whom, sitting in an official capacity, their wives had to appear in order to obtain their share of a village charity to which their claim had formerly been allowed without question. They, poor old women, were sneered rudely away and their just claim summarily refused. The whole of the circumstances were made public in three county papers. (I am glad to say that in this case the County Council was successfully invoked.) You would think that some apology was offered: you do not know the great farmer. Here is another case. A poor man had to carry round a circular, in which he was in no way concerned, emanating from the vicar of the parish. He took it to a great farmer in the same way as to the rest of the village. It did not please him, and he spoke very angrily to

the bearer. Such an ebullition of temper is sometimes too sudden to be restrained. Yes, but for weeks afterwards (for ever afterwards for aught I know to the contrary), when the poor man touched his hat, the great man passed on without noticing his salute. There is somewhere a fine translation of an old Spanish ballad of a Moorish king receiving the news of the taking of one of his towns by the enemy.

“Letters to the Monarch tell
How Alhama's city fell.
In the fire the scroll he threw
And the messenger he slew.”

The feeling is the same in both cases. Neither the fifteenth century tyrant nor the nineteenth century farmer could see any reason for repressing a natural feeling. Such men are not pleasant masters.

As far as my observation goes, I think primitive impulse is less restrained among non-working farmers than among any other equally well-fed and well-dressed class in England. For instance, cursing has died out among us generally. As villagers say, “We damn and done wi’ it.” It survives in corners where ridicule does not come. Here is rather an elaborate specimen of farming malediction. The speaker a well-gloved, well-hatted, well-groomed man, a non-working farmer. He had been disappointed (not in any way defrauded) of the services of the laborer to whom he was speaking.

“I wish you may die in a ditch without a rag to cover you or a crust of bread to put in your mouth. And I hope I may live to see it.”

This want of the conscious self-restraint which is imposed by the pressure of public opinion produces what I have called “characters.” In one farm there may be a half frantic sot; in another a man with a bad temper which he will discharge by following a laborer “up a furrow and down a furrow” and swearing at him all the way. One wealthy agriculturist is famous for his cottages which are known as “Tommy’s Pigsties.” He cannot bear to put his hand in his pocket for necessary repairs. It was in one of his cottages that the carpenter, going to measure a corpse for a coffin, started back in surprise. The white face was all streaked and blotched with green. It was only the drip of the rain through the rotten thatch—the moss, rather, for there was more moss than straw. “We’ve put un in the driest corner there was,” said the family apologetically. People who live in the sight of society (I mean of those whom they consider their associates) may be proud, but their pride rarely takes an aggressive form. Villages are seldom visited by the search-ray of publicity. In them pride of class has its perfect working. A celebrated agriculturist in the Bible might be the patron saint of many of his modern fellows—Nabal. “Such a man of Belial that a man cannot speak to him.” I have just been reading Sir Edmund Verney’s book, *American Methods*. Nothing is more striking than the easiness of access of the employer and the way he invites suggestions. I told a story once of a laborer, a friend of my own, who sat up nearly a whole night to get a plough of his master’s fit for work—without so much as a thank you. The employer was a

typical and leading man of his class. It would have been considered derogatory to notice a bit of work like that with a "thank you." Do what he will the laborer is an unprofitable servant.

To sum up this part of my subject. The isolation and the habits of life of the non-working farmer tend strongly to exaggerate in him those selfish instincts which make a man intolerable to his dependents. This is the more galling because his authority has been stretched so as to cover matters that lie quite outside the ordinary sphere of the relations of employer and employed.

I give this a leading place in the causes of rural depopulation.

Cottages as Booby-Traps.

Another cause is to be found in the laborer's helplessness before what he rightly or wrongly considers injustice. I take the matter of housing as illustrative of this. Bad housing is admittedly one reason of rustic discontent. I speak here of the cottage merely as a booby-trap.

I used as a boy to read of the booby-birds on the islands of the South Seas. They sat in rows, and sailors knocked them on the head one after the other, without its occurring to them to fly away. Laborers are much of the same sort. So should we be, I suppose, if our faculties and our energies had been deliberately crushed down for generations. They are trapped one after the other with the most touching simplicity. But they do not like it. Irritations of this sort go on accumulating unnoticed until the cup runs over. It is running over now.

Most cottages are "tied" to farms. Say a farmer has a very bad one; how is he to get a laborer in and make him stay? What is he to do? First, there is the advertisement, "good cottage and garden." Much hiring is done by letter. The laborer sees the advertisement. To go and see the cottage means losing a day's wage. I wish the wives went. But they don't. And they don't encourage their husbands to go. There is the money lost to begin with, and very likely a bad head resulting from much strange beer; and after all "what could *he* tell if he saw it?" Such is the contempt felt for the masculine mind by our natural rulers! He applies by letter for the place, is accepted, and fetched over with family and furniture in his master's waggon. If he goes into the cottage provided, the trap falls. He will be had up before the magistrates if he refuses to fulfil his agreement of service, in writing or verbal. I must give instances. Here is one from an Oxfordshire paper of a couple of months ago. A laborer is inducted as I have described. He stays one day and goes. His plea is that he had not seen the inside of the cottage; that it was raining, and that he had no choice but to put his furniture and family under cover. The master's son says he took him round, and that he had "a chance" of seeing the inside before he took the place. I have no doubt he might have seen it if he had insisted. But laborers, as a fact, have no courage to insist. He had *not* seen it. Fined £2 6s.; a month's wages, I suppose.

Here is another case in which a man made the best of a bad business but grumbled loudly. The inside was here also in fault. "Well, didn't you see it before you took it?" "I seed the *outside*

right enough. But the master as took I round didn't *happen* to have the key wi' 'un." Trapped!

The story I am going to tell came from the poor woman concerned through a lady who repeated it to me immediately afterwards exactly as I tell it. The family were engaged by advertisement. On arriving they found the "good cottage" a hovel, and refused to take their things off the waggon. On going up to the house they saw the master, "a girt big man, dressed up to the nines," who dealt roundly with them. "So you're the new carter. And you don't like your cottage. Now I'll tell 'ee summut. You've got to go where you be put and do what you be bid. I don't want none of your chat." They return to the waggon, the things still loaded, the woman resolute, the neighbors amused. The master comes down and bullies. The woman declares that she will spend the night where she is. The master goes away. On returning he changes his tactics and addresses the husband. "Now don't you go on like this here, a-making a fool of I afore all the village! Come up to the house and talk it over reasonable."

He goes. The woman stays with the things and children. By-and-bye at dark night he comes back "as drunk as ever I seed 'un." The things are put in. Trapped! "Why didn't you go to the clergyman?" asked my informant, scandalized. "Clergyman! why he and Mr. Blank be as thick as two thieves!"

A laborer came to a place by train. He wanted to "see things." The master met him and never lost sight of him till he put him into the train again after he had signed his agreement. The man came and stayed the twelvemonth he had agreed for. No more. *He did not even get the cottage he had been shown.* Trapped!

Here is a Hampshire case. The main facts are that the man was promised a good cottage and got one which, he said, was a bad one. That a number of laborers left the farm after he came, so that his position was different to what it would have been had the farm been full-handed. That his "little boys" (lads) were compelled to do work he had never agreed that they should do and were paid next to nothing. Three were put to work and two shillings a week was paid. It was admitted that the boys had had "a rough time for a bit" in consequence of shorthandedness. The man thought he had not been fairly treated and left. He had a sickly wife and ten children. The cottage had only two bedrooms. He gave eight days' notice. He was fined with costs *eight guineas* for having broken his signed agreement. I enquired privately into the case from people who were in a position to know the circumstances. There was also some correspondence about it in the papers. He had the character of being a steady laborer. The impression left on my mind was that his place had become almost intolerable. What could he do? Prosecute his master for breach of contract? Farmers would laugh at the very idea. Once in the trap he had to stay—or pay whatever fine country magistrates might impose.

The words used by the employer, the boys had "a rough time for a bit," cover a good deal. I will give you an instance.

The Society for Preventing Cruelty to Children was called in to help two poor boys signed away by their father (by his mark: he

could not read or write), under an avowedly illegal agreement decorated with a sixpenny stamp to impress the signer, for two years to a farmer. The society removed them at once, their condition of cold, filth and misery being extreme. The excuse given (I heard it with my own ears) was that "life was a bit rough on a farm."

The conclusion of the whole matter is this. The law says to the laborer "Caveat emptor." It does not protect him from sharp practice. There is no public opinion to which he can appeal. His sons drift away to the towns. I was told once as a fact of an aged laborer who bound all his children *by an oath* never to bring up a boy to the land. Can anyone wonder at it?

Some months ago I read in a London paper that laborers from town did not get on with farming employers because they would not understand that "a farmer's word was his bond." That is where it is. If the laborer is taken round by a possible master to see a cottage, for instance, and disputes the great man's assertion or insists upon seeing it for himself, he "gives offence." He had better not take the place after that. If he takes things upon trust and finds that he has been done, he has practically no remedy. And the master is utterly unabashed.

Another thing is that country laborers are shy. To enter into sanitary details with a well-dressed man of dominant manners is extremely difficult to them. One came to me a year or so ago and asked me what he was to do. I can't enter into details. I think they would surprise you. He had been taken round, and the master had assured him on the subject with a comprehensive wave of the hand, "*That's all right.*" Of course nothing could be done. He had been trapped.

I must pass very slightly over many things which combine to make the laborer's lot distasteful, void of savor, if not disgusting. I may mention (as I once wrote something on the subject that was met with a good deal of contradiction) that the immense, well-conducted farm of which I have spoken has of course swallowed up several considerable holdings, the residences on which, good sizable houses, are empty. There is no letting them. Gentlefolk of moderate means will not bury themselves in country villages. No one knows better than I do how very trifling is the difference to the laborers that the presence in a village of an independent family of small means can make. But it does make a difference, just as the presence of a decent passenger makes a difference to the crew of a merchant ship commanded by a brutal skipper. The passenger is powerless. But he sees, and the skipper knows it. I place the general and increasing absence of small gentry as a contributory cause of the distaste for the village life felt by the laborer. There is no one to break the long *tête-à-tête* between master and man. *Except the parson.*

The Laborer and the Church.

In speaking of the parson and the Church, I tread on dangerous ground. Let me begin by saying that parsons are almost invariably good and well-meaning men. My charge against them may almost be summed up in a rustic joke. The sign of "The Farmer's Man"

is not an uncommon one among village public-houses. The joke is that it ought to be taken down from the inn and hung up over the parsonage door. The parson is "the farmer's man." It can hardly be otherwise. According to the prevailing ecclesiastical theory, his object is to elevate the Church. The Church is to elevate the people. To do this, to give the Church the dominating influence necessary to her efficient action, the cordial co-operation of the leaders of the village world is indispensable. And it is not to be had for nothing. The payment made is simply this. The priest is to "pass by on the other side" while the farmer deals with the laborer. It is not his business to take a part in disputes. He is a man of peace—as far as his own village goes. His churchwardens are farmers. They are the Aaron and Hur who hold up the hands of Moses. So he conciliates them. He conciliates everybody of influence. He is perfectly civil to the publicans whose very existence depends upon their success in making laborers steady sots. He has a friendly greeting for the grocer, and knows nothing of adulteration and short weight. It is very unfortunate that cottages should be so bad. Encroachments on village rights are not within his province. Sometimes his desire to be pleasing to the great men of his flock goes further. Laborers very seldom use forcibly descriptive expressions. The turnips their grandfathers fed on have got into their blood. Yet I heard of one who was moved to speech after listening to an address in which a parson exhorted a number of laborers to be properly grateful for the generosity of their masters. "It was enough," he said, "to make a dog sick." I have felt the same myself.

A man and his master fell out. "Go to the parson and ask him what *he* thinks," said the master. "Why, you know, sir, what *he* would say," said the man.

I might go on. But I won't. Parsons are good men. But their very virtues keep the laborers down. They "seek peace and ensue it" at the cost of justice. Right and wrong are not merely the government and the opposition. Once admit party methods, and wrong infallibly prevails. It has prevailed. And the Church (like the man in Charles Lamb's celebrated thesis) "never knows it." She goes on. "I wonder you will still be talking, Signor Benedick. Nobody marks you." In a village nobody "marks" what the Church says.

We have all heard of Mithridates, the king of Pontus, who ate poison till he was poison-proof. So in *Hudibras*, the "King of Cambray, whose daily food Is asp, and basilisk and toad." Well, an English village is saturated with religion until it is religion-proof. Everybody goes to church, immense pressure is brought to bear to get the old men and women confirmed, most people are communicants. And religion, as a rule of conduct or a motive power, is absolutely non-existent. Why?

The success of the Church is the extent to which she can command the attendance of the village at her services. That is gaugeable. The Church is the mill that, theoretically, grinds congregations into Christians. But there is something wrong with the machinery. They come out, not contrite, not "ground up," but exactly what they went in.

Let us look back. In 1846, before the repeal of the Corn Laws, can anything have been more horrible than the condition of the country laborer? That was the very time when the Oxford movement was in the first flush of its youthful energy. An immense deal was done—for the restoration of Churches. Erroneous ideas about Gothic architecture were severely dealt with. But the clergy thought infinitely more of crocketts and finials than of cottages and cesspools. Five-and-twenty years later, at the time of the Agricultural Laborers' Union, it was exactly the same thing. The Church was contented that things should stay as they were. She saw no need of reform. It is said that she has undergone a complete change since: and the farmers also. What has brought about this wonderful, this *most* wonderful change?

No explanation is given. Is it not strange that the laborer should not have shared in it? He has sunk morally, it appears, while his spiritual guide and his kindly and tender employer have gone up. What is the natural inference? That the two have (wittingly or not) joined forces to keep him down.

For many, many years the position of Moses lay open to the acceptance of the Church. All she had to do was to qualify by slaying an Egyptian or two, by ranging herself definitely on the side of the oppressed. But the fear of families, as Job says, is too much for her.

In the forties, as in the seventies, she stood like a hen with a brood of ducklings, clucking reprobation while her charge faced the Red Sea. It was only when assured that the passage could be made dry-foot that she timidly ventured over.

The laborer hears the parson denounce from the pulpit the vices he condones in the street. He sees him greet with perfect friendliness a wealthy man known to all as an impudent thief of village rights, or the owner of tenanted cottages hardly fit for pigs, or a glutton and a soaker whose example makes his laborers sots. And he draws the natural conclusion. The parson is the farmer's man. The law is against him, the master is against him, and the parson maintains a benevolent neutrality.

To sum up. The law is dreaded by the laborer, not regarded as a protector. It is administered by men who mostly belong to the class who set it in movement against him. The clergyman identifies himself socially with the same class. Any power of combination that laborers might possess is nullified by the insecurity of their tenure as cottagers. He has no one to turn to in trouble.

What has the laborer to regret in leaving his village? Home ties have grown very weak. "The home" means, in rustic parlance, the beds and chairs and tables, "the bits of sticks" a family has got together. The tied cottage is no more to the laborer than a borrowed umbrella.

Village life is very dull. There is nothing communal in it. The school is the property of the parson and the managers, generally farmers. The poor have got to send their children. There their interest practically ceases. They want them to become half-timers as soon as possible, that is all. The Church gives them no interest. They have no voice in its management, and are fed with this doc-

trine or that as it pleases the patrons. At best, it represents to them the "circus" which Lord Salisbury said was more to their taste than a council.

The Decay of the Village Band.

Sixty years ago music still survived in country villages. What killed it? The Church. The old church band was too independent for the clergyman of the Oxford movement. The "musicianers," as they were called, used to quarrel in an unseemly way. Disputes among the band were got rid of by something very like the summary process of the father who cuts his little boy's head off to cure him of toothache. The band was suppressed and a harmonium substituted. Away went fiddles and brass with the bass viol and the "old serpent" at their head into the limbo of the village past. (The old serpent was a brass instrument of mysterious convolution.) Music was promoted from the fireside to the schoolroom or the vicar's parlor, where the choir met for practice. The old fiddles were hung up and forgotten. Only the other day I was told by a lady of great musical accomplishment of an attempt she was making to get up a string band in a large parish. People laughed at her. How were poor people to buy violins? But nearly all the instruments wanted were there. In many poor families the old fiddles had been kept, though the art of playing had been utterly forgotten.

The intention of the clergy was admirable. A decorous worship, and the village boys brought under the influence of the Church. That is one side. On the other, the destruction of almost the last form of communal effort for a common end, the capture by "the powers that be" in a country parish, of a last little stronghold of the independence that has disappeared from our laboring population. There are none such now; the guns of the Church, directed by the landed interest, range unobstructed over a plain of dead and flat submission. Dissent! Dissent pays homage at births and deaths and marriages. The chapel has little power to raise. The old Puritan spirit, in country villages at least, seems to have been squeezed out of it.

Co-operative Stores?

What inducement is offered to the laborer to stay in the village? I am told by a very competent authority that, reckoning quality and price, to deal at London stores is 25 per cent. cheaper than to buy at the village shop. Besides, laborers are mostly in debt, and "beggars mustn't be choosers." That makes things still worse. The remedy, of course, is co-operation. But how are families to co-operate when neighborhood is not permanent? Besides which, mutual trust has perished with community of interest. It has been atrophied by want of exercise.

Half-a-dozen villagers might conceivably club together to let some lady, for instance, whom they all knew, get them a side of the best bacon from the stores at the price they paid for the very worst at the shop, and divide it. She would certainly be accused of partiality but *perhaps* not of absolutely dishonesty. But to do such a thing among themselves would be out of the question.

Fixity of tenure must precede co-operation, and until co-operation is the rule the laborer will continue to be despoiled in every petty transaction of his existence. One attraction of the city for him is that there he gets more choice and better value for whatever little money he has. Whatever he may possibly regret in the "land of Egypt, the house of bondage," it is not the flesh-pots. A "penn'orth of fried fish" in Whitechapel is probably a tastier meal than the escaped ploughboy has ever put into his mouth.

Village Schools.

What does the village school do with the brains entrusted to it? Brains are valuable. The Yankees are teaching us that. Well, in one village school I know, with an average attendance of between 80 and 90, I cannot hear on enquiry that any lad educated there has risen in the last twenty years above the position of a mere laborer. Go to the town or stay in the village; it is all one. Schooling directed by the Church and the Land has naturally turned out the article wanted by the Church and the Land—men of low intelligence and no enterprize. There are no games, and there is none of the initiative that comes of games. There is no recreation ground, no village green. The 3,500 acres of the village are practically divided into three great farms, sprinkled with the remains of former smaller homesteads. There was in old times a recreation ground. Old men have told me of the back-swording and wrestling that went on there. It was "absorbed" long ago, whether legally or illegally I know not.

Remedies.

To suggest remedies hardly comes within the limits of my subject. If I touch upon that I must be brief indeed. And every word may be a bone of contention. Well, the great farmer stops the way. No progress is possible as long as he dominates the situation. We must call into existence a class of small, independent cultivators, the natural growth of which will progressively thrust him off the track. Some small beginnings have been already made. The results show, I think, that the machinery provided by law (Agricultural Holdings Act, 1892—result, 700 or 800 acres) will not work. Local government has become the appanage of acres. Parish councils, rural district councils, county councils, they all represent the essence of landed interest in various degrees of concentration. And the classes that now enjoy a practical monopoly of the land will never efficiently help in dispossessing themselves.

Now, what part of England has the largest interest in the land of England's being made the most of? The country? Or the town? The town population is four to one of the country population. And a large proportion of the number represented by the one only live by sufferance on the land. This is the case with almost the whole of agricultural laborers. The evils inflicted upon the great majority by this insignificant minority are, I think, the following:

1. Dearness of food arising from low productivity of land.
2. The burden of providing labor for country men. The land does not take her share of the task of finding employment

for the working men of England, but shuffles it off upon the towns.

3. The consequent congestion of the towns.
4. The ruin of the country as the breeding-field which ought to keep up the vigor of the town populations.
5. The closing of the country to the towns, so that increased facilities of locomotion do not do anything like the good to the towns that they should.

The moral I draw is that the towns should claim the right of dictating to England the way in which the land should be put to profit. The great majority of the classes nearest the land, squires and farmers and parsons, are disqualified respectively by self-interest, by religious prejudice that scruples at anything that may lead to the mental enfranchisement of the poor, and by sheer sluggishness of intellect joined to a blind selfishness without parallel in any class of English society. The land and the laborer have hitherto been left to them. And we want a change of management.

I should like to say something of the last of the evils I have enumerated. The closing of the country to the towns.

Take a mechanic with 35s. a week. He wants country air. There is the bicycle and there is the beanfeast. One means dust, the other drink. If he is enterprizing he will go down to Brighton or Ramsgate and change the asphalte of the streets for the asphalte of the promenade and a crowded park for a stretch of crowded sand. Lodgings are dear, so is food. He gets uncommonly little refreshment for the good money and the priceless holiday he throws away there. To go down and spend his three days in a country village never occurs to him. And rightly. But suppose it does. What is he to do? Take lodgings in a cottage? If he is a decent man it would turn his stomach. In a beer-house? Hardly better. The food would be uneatable, the price calculated by his coat. At the lowest, it would be three times that at which he could feed himself well in London. What is he to do with himself? The park is closed, the downs warn him off with a threatening notice. "Farmer Blank," he is told, "doesn't like people trespassing in his fields." The churchyard or the bar-parlor, he may spend his day in either and welcome. Perhaps, not generally, there is a village green, with a goose or two. It is a fine evening, but there are no children at play. He asks. "Ay, the farmers get up a match at cricket among 'emselfes once or twice i' summer." "Don't the boys play?" "Naw. Summon gied 'em a bat but they bin and lost the ball."

He returns to London in despair and disgust.

Let us suppose 30 or 40 small independent holders to have taken the place of three or four large farmers. From what we know of Denmark, Belgium, France, Holland, and of recent experiments in Ireland, we have reason to believe that co-operation will have largely taken the place of the individual struggle for life that now makes of an English village a den of hungry beasts. We may hope that in a few years villagers will have re-learnt the forgotten art of enjoyment. They will have learnt to feel with energetic conviction that the

natural beauties that surround a village are the property of the village, as far as the *enjoyment* goes that neither does material damage nor interferes with other legitimate enjoyment. They will have learnt to believe that the maddest dog in England is the Dog in the Manger, and when such a one shows his nose in a village their belief will be very apt to take an active form.

Views are not damaged by being looked at ; it does not spoil timber to sit in the shade of a tree ; grass is little hurt by children's picking cowslips in cowslip time ; blackberrying breaks few hedges.

A New Village Industry.

You here know better than I do to how many Londoners "each simple joy the country yields" would be an attraction and a real rest and refreshment, if they could only come by them. I look forward to a time when the entertainment of London visitors will be one of the great industries of country villages. When the country will be to London what Switzerland is to Europe. When the communal guest-house will "do" a London visitor *well* for 2s. 6d. a day and night and bring a handsome profit to the community. When relations of friendship will exist between townsmen and countrymen and when the born rustic who happens to be a native of White-chapel will quite naturally and easily take the place of the born Londoner who came into the world at Stogginton. When a girl going up to service in town will find that she has there a circle of acquaintances made in the country, and holiday London, instead of swarming like bees to the treacle-pots of Ramsgate and Hastings, will scatter itself over the villages within a radius of 50 or 60 miles. A game of bowls under a tree is pleasanter than "Aunt Sally" on the sands ; a stretch over high downs and sandwiches under a may-bush are better than the foulness of the sea beach at the great tripping places and the heart-sickening uniformity of the cheap restaurant.

London should remember that the restoration of the laborer to the land in the character of an independent peasant may mean to London the opening of several hundred places of enjoyment ; to many thousands of Londoners, themselves only two or three generations away from the country, the re-awakening of that natural love of fields and leaves which exists in them so strongly as children and is so terribly obscured as they grow up by the uncounteracted influences of the public-house and the music-hall. London should remember, too, that it is better that the country should send up to recruit her population young freemen, with a happy boyhood behind them, than heart-broken drudges escaping from a bitter servitude.

There is no making a Garden City of London. But the whole country within a radius of 70 or 80 miles may be made a garden of pleasure for Londoners to enjoy, with wrong to none, with infinite good to many, and to the general benefit of England.

Public Wealth and Corporate Expenditure.

*An Address to the Ancient Order of Foresters at their Annual Gathering in Birmingham Town Hall, on Sunday, October 9th, 1904.**

“PUBLIC WEALTH” means wealth belonging to a Community or Corporate Body; and the possessor of such wealth can utilize and administer it as Corporate Expenditure. By “Corporate Expenditure” I mean not municipal expenditure alone, nor trades union expenditure alone, nor benefit society expenditure alone, but something of all of them; combined expenditure for corporate ends, as distinguished from private and individual expenditure. I wish to maintain that more good can be done and greater value attained by the thoughtful and ordered expenditure of corporate money, than can be derived from even a lavish amount distributed by private hands for the supply of personal comfort and the maintenance of special privileges.

It sounds like a secular subject, but no subject is really secular, in the sense of being opposed to sacred, unless it is a subject intrinsically bad; and if the truth be as I imagine myself now to conceive it, the subject I am endeavoring to bring forward has possible developments of the most genuinely sacred character. I shall not have time to develop this fully, but I can make a beginning.

Careless Spending.

First I would direct your attention to a fact and ask you to observe how little thought is expended by mankind in general on the spending of money, and how much time and attention are devoted to the earning of it. That may seem natural; it is considered easy to spend and hard to earn. I am by no means sure that it is easy to spend wisely. Men who have much money to spend—and few of us are in that predicament—if they are conscientious

* The Society is indebted to Sir Oliver Lodge for permission to print and issue this Address as a pamphlet.

and good men, feel the difficulty seriously; they realize that it is so easy to do harm, so difficult to know how to do real good. Charity may seem a safe and easy method of disbursing, and much of it at present alas is necessary, but few things are more dangerous: it is an easy salve to the conscience, but it by no means conduces to fulness and dignity of life.

But eliminating men of large fortunes, let us attend to our own case. We, the ordinary citizens, how little time do we find to consider our manner of spending; we mostly do it by deputy, all our time is occupied in earning. It may be said roughly that men earn the money and that their wives spend it: a fair division of labor. They spend it best: and if the man insists on retaining and spending much of it, he is liable to spend it very far from wisely or well.

Public v. Private Expenditure.

I will not labor the point; we get something by private expenditure undoubtedly: we get the necessities of life, and we get some small personal luxuries in addition. We do not get either in the most economical fashion. Buying things by the ounce or by the pint is not the cheapest way of buying; nor is a kitchen fire in every household the cheapest way of cooking, especially in the summer. Without going into details, and without exaggerating, we must all see that individualism results in some waste. If each man pays for the visits of his own doctor it is expensive. If each man provides his own convalescent home it is expensive. If each man goes on his own excursion or travels it is not so cheap as when several club together and run the journey on a joint purse. Private and solitary travel may be luxurious, but it is not cheap. A cab is dearer than an omnibus; a private garden is far dearer in proportion than a public park. Of private expenditure altogether it may be said: some of it is necessary, much of it is luxurious, but none of it is economical.

Corporate or combined expenditure achieves a greater result, not only for the whole, but actually for each individual. "Each for himself" is a poor motto; the idea of "Each for all" is a far more powerful as well as a more stimulating doctrine than "Each for himself." Thus

already you see our subject shows signs of losing its secular character and of approaching within hailing distance of the outposts of Christianity.

The Objects of Thrift.

Very well, now go on to consider the subject of *thrift*—not personal spending, but personal saving. What is the saving for? There are two chief objects:—

(1) To provide for sickness, for old age, and for those who are dependent upon us, and whom we should otherwise leave helpless when we go. This is clearly the chief and especially forcible motive for saving: it is the main-spring and original motive-power of this and all other benefit societies. But there is also another not at all unworthy motive, though it is one less generally recognized or admitted, and to this I wish incidentally to direct attention.

The second great motive for thrift and wise accumulation is—

(2) To increase our own power and influence and effective *momentum* in the world.

The Power of Wealth.

The man of wealth is recognized as a force in the world, sometimes indeed a force for evil, sometimes for good, but undeniably and always a power. People often complain of this and abuse the instinct which recognizes wealth as being such a power. But it is inevitable. It does not indeed follow that great wealth need be concentrated in a few hands, or that one single individual shall have the disposal of it: it is an accidental and, as I think, an unfortunate temporary arrangement of society which brings about that result; but, whether in many hands or in few, wealth is bound to be a power: it is no use abusing what is inevitable, we must study and learn how to utilize the forces of nature. Wealth is one of those forces.

Why is it so powerful? Because it enables its owner to carry out his plans, to execute his purposes, to achieve his ends. He has not to go cap in hand to somebody and ask permission; he can do the thing himself. He cannot do everything indeed, his power is limited, but

he can do much. So also the members of a wealthy corporate body, if they want to do something, if they want to meet elsewhere than in a public-house, for instance, encounter no difficulty, they can have a hall of their own, or they can hire one. Wealth is accumulated savings. Considered as power, it does not matter whether the wealth is in many hands or in few. The owners of it are important people; and if they mean to do good the material accessories are at their command. A rich corporation, like a rich man, has great power. Suppose he wants to bring out an invention, his own or someone else's, he has the means. Suppose he wants to build a laboratory or endow a University, he can do it. Suppose he wants to plant waste land with forest trees, who will stop him? But he cannot do everything. A genius has powers greater than his. A rich man's power is great, but it is limited; for suppose he wants to compose an oratorio, to paint a picture, to make a scientific discovery, and has not the ability; his wealth is impotent, he cannot do it. No, his power is strictly limited, but it is not so limited as that of the poor man.

The Weakness of Poverty.

We are poor men, and some of us want to renovate the Black Country and cover up its slag heaps with vegetation and with forests—a beautiful and sane ideal—but it is a difficult task. I do not own a square foot of soil, nor do most of you. What right have we to go to plant trees on someone else's land? We should be trespassers; and, at a whim of the owner, they might be rooted up. The owners of the soil however may be willing for the re-forestation of the Black Country, they may give us assistance, they may enable us to carry out the scheme. I sincerely hope they will, but we must go and ask them. Without the wealth we are powerless. We see so many things that might be done if we had the means: for instance, we helplessly lament the existence of slums, we see numerous ways in which to improve cities, we would like to suppress smoke and show how the air could be kept pure for the multitudes herded in cities to breathe and enjoy; but we cannot do it, we are not rich enough. Moreover, if we did, what would happen; at least at

first? Rents would rise, and the improved property would become too dear for the present inhabitants to live in. Clear and purify the air of towns, and they would at once, with their good drainage and fine sanitary conditions, become the best and healthfullest places to live in. Now they are too dirty, then they would be too dear.

But, if the land near all large towns belonged to the community, if we had corporate ownership of land, what would we not do! Then the improvements would be both possible and profitable, and the community who made them would reap the benefit.

Someday: someday an approach to this condition of things is bound to come. It feels to me almost like part of the meaning of that great prayer "Thy Kingdom come"; and if so we are again not far away from the atmosphere of Christianity.

Public Wealth and Public Debts.

For accumulation of wealth to be really beneficial it should contribute to the common weal, it should conduce to well being, and so be worthy of the name of *weal-th* or wealth.

The only way probably you and I can ever become wealthy is by becoming corporately wealthy, by clubbing our savings and becoming an influence and a power in the land.

Already I see, by your Report, that this organization or corporate body owns more than seven millions: not seven millions free to be dealt with as you like, it is all ear-marked to good and beneficent objects, and all needed for the achievement of those objects; but still it is a substantial sum, and it can increase. Roll it up to seventy millions, apply it to other objects than sickness and death, and you will become capitalists, able to execute your behests, an influence and a power in the world.

Would this be a good thing? Ah, that is a large question. There are always dangers in great capital, it is a serious responsibility; and if badly and domineeringly used, it may become a fearful evil. In unwise and unscrupulous hands, if they are ignorant and foolish, it is far from safe. But let it come gradually, let it be owned by mankind or by the community at large, and I for one

would trust them—we are bound to trust mankind—would trust them at first to endeavor to make a good use of it, and ultimately to succeed in so doing.

I believe in public capital and public expenditure, so it be clean and honest and well managed; everything depends upon that; but in this fortunate city that is already accomplished. What is known as a public debt is really a public investment, and anything not spent in the waste of war should have public works, or elevated humanity, or other good results, to show for it. Then it at once becomes capital, and is no more appropriately called debt; it has not been spent, but invested. “Funds” is a better name for it.

The Economy of Rising Rates.

That is why I believe in Rates—not altogether in the Poor Rate, for I am unable to feel that the Poor Law is on a satisfactory basis, though it is administered with the best intentions by the guardians: the system is as I think in some respects mistaken, but I will not go into that now; I only say parenthetically that the Poor Rate I do not welcome—but rates for public works, education rates, rates for municipal and corporate services generally, rates for museums and libraries and recreation grounds and parks and rational amusements, all these I would welcome and wish to grow.

We should not try to economize in these things, we should put our heads together so as to spend the public money wisely and well, and then, we should spend it. Private thrift, public expenditure; that is the way to raise a town or a nation in the standard of civilization.

The spendings of an individual, what are they? They are gone in his individual comfort and luxury. The spendings of a community are Capital: they result in public works, in better housing, in good roads, in thorough lighting; they open up the country, they develop its resources, they educate the citizens, they advance all the amenities of existence, in an economical because corporate or co-operative manner.

Good management is required; and that is why you take pains to send good men to the City Council to look after your interests: your interests, not in screwing and

economizing, but in spending wisely and honestly and well, getting the most they can for your money, and looking out for improvements and for good schemes worthy of encouragement. And when they do this well, be ready to trust them with more; see that not only the municipal but the national purse also is properly supplied. Our National Government is for all good purposes miserably poor. I fear there is sad waste somewhere, and that before the taxes can be judiciously raised the sources of the waste must be discovered and checked. I trust that already this labor is being put in hand. You have fine public servants who are trying to do their best with an ancient and very cumbrous and over-centralized machine; much revenue has to be spent in various unprofitable ways, wars and other, but in every good and noble direction of expenditure the country is miserably poor. Where it is economical it should be lavish; and where it is lavish it should be economical; that is an exaggeration, but there is a kind of truth underlying it. Our national economy in higher education is having disastrous results, it is a real danger to the Nation. While other nations are investing millions of public money on higher education and research we prefer to keep the money in our pockets in order to spend it privately; and the result is that while the State is poor the individual is rich. Individuals are over rich in this country; money breeds money on our present system with very little work, and it is apt to roll itself up into portentous and top-heavy fortunes. The result is, I fear, a state of things that some people say is becoming a scandal. I do not know. But however that may be I should like to see this wealth owned by communities; I should like to see it in corporate hands and expended for the general good.

Unearned Incomes.

Do not think that the original making of a fortune is easy. Most fortunes began by thrift and enterprise; it is not the making of a fortune that is easy: it is the transferring and the inheriting of it that are so fatally easy and so dangerous. If the maker of the fortune himself had the disbursing of it, there would be but little harm done, and there might be much good. No fortune can be

honestly *made* without strenuous industry and character. But a fortune can be inherited, *can* be inherited I say, though I hope it seldom is, by a personification of laziness and folly and vice.

That however is not my point. My point is that self-denial is the beginning of capital and the essence of thrift—present self-denial for future good. This self-denial for future good you of this and kindred societies are already exercising in a small way, but it is possible and indeed likely that it will come to be exercised in a larger way, and so gradually a considerable fraction of the property of the world may ultimately pass into your hands. Wake up to this possibility, and do not abuse capital or capitalists, for some day you will be capitalists yourselves. Then it will strain your energies to know what to do with it, and how to use it for the best and highest good of humanity—the ascertainment of which is a noble aspect of human endeavor.

I do not expect agreement in all that I have to say, nor do I speak with authority; I am anxious to admit that I may be mistaken; I only ask you to consider and weigh my message, the more so if you disagree; as I know many will, especially in what follows:—

The Cheapness of High Salaries.

The tendency of public bodies is to economize in salaries. People look askance at highly paid public servants; whereas it is just from those that you do get something for your money. You don't get much service as a rule from dividend shareholders, but you do as a rule from salaried officers. That is the danger of municipalities and other democratic corporations: they will not realize with sufficient clearness that the manager and administrator is worthy of large remuneration, that to get the best man you must pay him well, and that to put up with a second rate article when you can get the best is but a poor policy, and in the long run bad economy. Cheap men are seldom any good. In a large concern they may waste more than their annual salary in a week. Some people want to pay all men alike. It will not work. It is a subject full of controversy, I know, and I do not wish to dogmatize, but so far as I can see, and I have no

personal interest in the matter, I say that the principle of inequality of payment must be recognized, that it is a necessary consequence of inequality of ability.

Some organizations seem to think, too, that the available work of the world is limited, and that you must each be careful not to do too much of it lest work become scarce. The truth is that the work potentially required by mankind is essentially unlimited; and if we could only get better social conditions there would be work and opportunity and scope for all, each according to his grade and power and ability.

Stand shoulder to shoulder and help each other, and form a banded community for mutual help, by all means; let all co-operate together, and let not one human being be idle except the sick and insane; but allow for different kinds of work, and put the false glamor of the idea of artificial equality out of your minds. In any organization, as in any human body, there must be head and there must be hands, there must be trunk and limbs: the good of the whole is secured by each doing his apportioned task and obtaining his appropriate nourishment: not every part alike, though each sufficient for his need: each brought up to his maximum efficiency.

And what is true of property is true of personal service also. That which is spent for the individual is of small value compared with service done for the race. It is on the pains and sacrifice of individuals that a community is founded. "The pleasures of each generation evaporate in air; it is their pains that increase the spiritual momentum of the world." (J. R. Illingworth, in *Lux Mundi*.) The blood of the martyrs was the seed of the Church; it is by heroism and unselfish devotion that a country rises and becomes great.

The Results of Public Spirit.

Witness the magnificent spectacle of Japan to-day: the State above the individual; common good above personal good; sacrifice of self and devotion to the community; these great qualities, on which every nation has risen to glory, were never displayed more brightly in the history of the world than now before our eyes. It is a nation which is saturated and infused with public spirit,

the spirit of the race, enthusiasm for the community and for the welfare of humanity. This is the spirit which elevates cities; it is this which makes a nationality; it is this which some day will renovate mankind.

A splendid article in the *Times* of last Tuesday calls it "the soul of a nation," a translation of the Japanese term Bushido. It is a sort of chivalry, but the term "chivalry" does not convey it; our nearest approach to it is "public spirit," public spirit in a glorified form, the spirit which animated the early Christian Church, so that prison, suffering, death itself, were gladly endured so that the gospel might be preached and humanity might be saved—a spirit which must be near akin to the divine idea of Sacrifice for the salvation of the world. To lose your life as the highest mode of saving it; to lose the world but retain the honor and dignity of your own soul; that spirit which animated the apostles, prophets, martyrs, is alive in Japan to-day. Is it alive in us as a nation? If not, if we have replaced it to any extent by some selfish opposite, by any such diabolically careless sentiment as "after me the deluge," then we as a nation have lost our soul, sold it for mere individual prosperity, sold it in some poor cases for not even that, for mere liquid refreshment, and we are on the down grade.

I trust it is not so, but sometimes I greatly fear it. It is surely not too late to arrest the process of decay; the heart of the Nation is sound enough: the men, as they said in South Africa, the men are splendid. Give them a fair chance, introduce better conditions, set forth high ideals, and be not ashamed to speak of these ideals and to follow them: then we shall find that there is plenty of the spirit of unselfishness still, the spirit which calls men to harder tasks than momentary spurts of bravery, calls us all to the long and persistent effort of educating ourselves in the facts of the universe, grasping the real truth of things, and, then with patience and self-control, applying our energies to the material betterment and spiritual elevation of the world.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. Paper cover, design by A. G. Watts. 3d., post free 4d.; 2/3 per doz., post free, 2/7.

FABIANISM AND THE EMPIRE: A Manifesto. 1s. net.

FABIAN ESSAYS IN SOCIALISM. (43rd Thousand.)

Paper cover, 1/-; plain cloth, 2/-, post free from the Secretary.

FABIAN TRACTS and LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 81, 3s.; post free 3/5. Bound in Buckram, 4/6; post free for 5s.

I.—General Socialism in its various aspects.

TRACTS.—121. Public Service versus Private Expenditure. By Sir OLIVER LODGE. 113. Communism. By WM. MORRIS. 107. Socialism for Millionaires. By BERNARD SHAW. 133. Socialism and Christianity. By Rev. PERCY DEARMER. 78. Socialism and the Teaching of Christ. By Dr. JOHN CLIFFORD. 87. The same in Welsh. 42. Christian Socialism. By Rev. S. D. HEADLAM. 79. A Word of Remembrance and Caution to the Rich. By JOHN WOOLMAN. 75. Labor in the Longest Reign. By SIDNEY WEBB. 72. The Moral Aspects of Socialism. By SIDNEY BALL. 69. Difficulties of Individualism. By SIDNEY WEBB. 51. Socialism: True and False. By S. WEBB. 45. The Impossibilities of Anarchism. By BERNARD SHAW (price 2d.). 15. English Progress towards Social Democracy. By S. WEBB. 7. Capital and Land (6th edn. revised 1904). 5. Facts for Socialists (10th edn., revised 1906). **LEAFLETS.**—13. What Socialism Is. 1. Why are the Many Poor? 38. The same in Welsh.

II.—Applications of Socialism to Particular Problems.

TRACTS.—131. The Decline in the Birth-Rate. By SIDNEY WEBB. 130. Home Work and Sweating. By Miss B. L. HUTCHINS. 128. The Case for a Legal Minimum Wage. 126. The Abolition of Poor Law Guardians. 122. MUNICIPAL MILK AND PUBLIC HEALTH.

BY

F. LAWSON DODD, M.R.C.S., L.R.C.P.,
D.P.H. Lond.

PUBLISHED AND SOLD BY

THE FABIAN SOCIETY.

PRICE ONE PENNY

LONDON :

THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.

PUBLISHED JUNE 1905. THIRD REPRINT JUNE 1914.

THE FABIAN SOCIALIST SERIES.

VOLUMES NOW READY.

I. SOCIALISM AND RELIGION.

CONTENTS: (1) Christian Socialism, by the Rev. Stewart D. Headlam. (2) Socialism and Christianity, by the Rev. Percy Dearmer. (3) Socialism and the Teaching of Christ, by the Rev. John Clifford. (4) A Word of Remembrance and Caution to the Rich, by John Woolman.

II. SOCIALISM AND AGRICULTURE.

CONTENTS: (1) The Village and the Landlord, by Edward Carpenter. (2) State Aid to Agriculture, by T. S. Dymond. (3) The Secret of Rural Depopulation, by Lieut.-Col. D. C. Pedder. (4) The Revival of Agriculture, by the Fabian Society.

III. SOCIALISM AND INDIVIDUALISM.

CONTENTS: (1) The Difficulties of Individualism, by Sidney Webb. (2) The Moral Aspects of Socialism, by Sidney Ball. (3) The Impossibilities of Anarchism, by G. Bernard Shaw. (4) Public Service *v.* Private Expenditure, by Sir Oliver Lodge.

IV. THE BASIS AND POLICY OF SOCIALISM.

CONTENTS: (1) Facts for Socialists, by the Fabian Society. (2) Capital and Land by the Fabian Society. (3) Socialism: True and False, by Sidney Webb. (4) Twentieth Century Politics, by Sidney Webb.

V. THE COMMONSENSE OF MUNICIPAL TRADING.

By Bernard Shaw. With new Preface. "Whether you agree with it entirely or not, you are bound to admit its intellectual power and persuasive eloquence."

VI. SOCIALISM AND NATIONAL MINIMUM.

By Mrs. Sidney Webb, Miss B. L. Hutchins, and others.

VII. WASTAGE OF CHILD LIFE.

By J. Johnston, M.D. "Passing from one count to another, he puts together his huge indictment of national extravagance; showing also how the practice of thrift might ensure to the nation the possession of healthy and efficient citizens."—*Daily News*.

VIII. SOCIALISM AND SUPERIOR BRAINS: A Reply to Mr. Mallock.

By Bernard Shaw.

IX. THE THEORY AND PRACTICE OF TRADE UNIONISM.

By J. H. Greenwood. Preface by Sidney Webb.

The first four volumes consist of a revised, collected, and classified edition of some of the most valuable of the famous "Fabian Tracts" in a style more suitable for the general reading public. Each booklet is printed on good paper with good type, and is supplied in two forms, viz., in attractive wrappers at 6d. each, net, and in quarter cloth boards, gilt top, at 1/- each, net. Postage: 1d. and 2d. each, except for No. 5, 1½d. and 2d.

THE FABIAN SOCIETY, 3, CLEMENT'S INN, STRAND.

FIFTH EDITION. REVISED.

WHAT TO READ

ON SOCIAL AND ECONOMIC SUBJECTS.

AN UP-TO-DATE, SELECT BIBLIOGRAPHY, DEALING WITH
SOCIALISM, SOCIAL AND INDUSTRIAL PROBLEMS,
ECONOMICS AND ECONOMIC HISTORY, POLITICAL SCIENCE,
GOVERNMENT AND ENGLISH HISTORY.

Compiled by the Fabian Society for Students of University
Extension Lectures and Classes, for persons investigating
Social Problems, and for the general reader.

Interleaved, in Paper Cover, 1s. net; postage 2d.

Bound in buckram, 2s. net; postage 3d.

THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, LONDON;
or of P. S. KING & SON.

Municipal Milk and Public Health.

THE attention of students of social science, as well as that of public health workers generally, is daily being more and more directed to the food supply of the people. The great epidemics of the nineteenth century resulted in such legislation as the Public Health Acts, which aimed at the external control of the environment of the population of the urban and rural sanitary authorities. But experience shewed that mere external interference was insufficient, and hence a movement became general towards investing the *ownership* as well as the control of the water supplies of the country in the hands of the community. The result shewed that although carelessness was not entirely got rid of, yet the condition of the publicly owned supplies was far safer and better than those left to private commercial management. It was proved that in the case of such a prime necessity as water—one so liable to pollution—the aim of profit-making must be superseded by the consideration of the public health, even though this might involve financial loss. No one will now deny the beneficial results of this change, and few will be found who oppose, in principle, the municipal ownership of water supply. This change has consisted in the replacement of an unlimited number of privately owned wells, from which bad water was sold at a high price, by a popularly owned central supply systematically distributed at about cost price to rich and poor alike. This change of industrial method, combined with public knowledge, has been the main cause of a reduction in the death-rate* of about 3 per 1,000 per annum in the space of about twenty years. The annual rate of mortality from enteric fever—the chief of water-borne diseases—sank in the same time from 390 per 1,000 to 100.

With these facts in view, sociologists are beginning to ask themselves the question whether there is not the same need for public ownership and control of the milk supply. At the present time this indispensable commodity is being drawn from a thousand indiscriminate sources, whose main characteristic is the general dirtiness and stupidity of their methods of production; and whose distribution is through agencies, most of which are marked by their liability to contaminate the article they handle. It is no exaggeration to say that the great bulk of milk producers, distributors, and retailers know nothing of the nature and properties of the material they deal in, while such an elementary knowledge is essential for the public safety. County councils are doing something to teach dairying, but so long as it is as profitable to sell dirty milk as clean, or preservatized butter as fresh, these efforts will produce but scanty fruit.

* See Sixty-Sixth Annual Report, Registrar-General for England and Wales, 1905.

Public attention has recently been drawn to the existence of widespread physical deficiency among the children attending the public elementary schools of the country, and although the Inter-Departmental Committee on Physical Deterioration reported that there was no evidence to prove the existence of actual degeneracy, both that body and the Scotch Commission on Physical Training draw attention to the infantile mortality which is now actually higher than in the decennium 1841-50, as well as to the manifest weakness and liability to disease of a considerable proportion of the children at or below school age. Both agree that for children, at all events for young children, the most important factor in development is their food, and that, in this particular, everything seems against the children of the poor in increasing degree towards the earlier periods of life.

In times when breast feeding is on the decline*, milk is becoming the staple food of an increasing number of the population. Throughout the earlier years of life it forms the most important element of diet, and hence the absence of milk from the diet of the poor involves almost certain underfeeding, or even starvation, for a proportion of their children. In order to build up the physique of the masses of the people, some method must be devised of procuring for them a clean, wholesome, and cheap supply of milk, and the question to be answered is: Can complete public control do this, or can it be better done in some other way? Let us, however, see what are the present methods of production and distribution.

Present Methods.

It may be confidently said that nowhere, except on the very small number of model farms, is anything like a really scientific method of milk-production known. But the most noticeable thing is not the absence of science, but of common cleanliness. Indeed, many dairy farmers believe that dirt is a good thing, that heated and ill-ventilated cowsheds are good for the cows, and that manure gives body and flavor to the milk. For instance, Dr. Leslie Mackenzie, speaking for Scotland, says: "To watch the milking of cows is to watch a process of unscientific inoculation of a pure, or almost pure, medium with unknown quantities of unspecified germs. Everywhere throughout the whole process of milking the perishable and highly nutrient liquid receives its repeated sowings of germinal and non-germinal dirt . . . and this in good dairies. What must it be when the cows are never groomed, and the udders are never washed, where the byres are never even approximately cleaned, where ventilators are never opened, where the pigs are a few feet away, where cobwebs are ancient and heavy, where hands are only by accident washed, where heads are only occasionally cleaned, where spittings are not infrequent, where the milker may be a chance comer from some filthy place, where, in a word, the various dirt of the civilized human are at every hand reinforced by the inevitable dirt of the domesticated cow."†

* Infantile Mortality and Infant Milk Depots. G. F. M'Cleary; 1904. Chapter I.

† "The Hygiene of Milk," *Edinburgh Medical Journal*; 1898.

In a series of articles, entitled "The Milk Supply of Large Towns," the *British Medical Journal* drew attention, in March, 1903, to the defective conditions of milk production which are so prevalent. The Commissioner, reporting on a farm outside a large town, says: "The operation of milking was in full swing, three dirty-looking boys being hidden away behind their respective cows. . . . The clothes which the boys wore were equally dirty, and the stalls, which they were supposed to have been cleaning out while I was waiting, were several inches deep in manure and foul-smelling straw. . . . The hind-quarters of the cows were coated with filth. . . . I was horrified to see the filthy state of the milk as it flowed out of the pail. It was discolored with grit, hair, and manure. 'Look at that,' I said, pointing to a specially large bit of manure. I regretted my zeal, for Tom dipped his whole hand into the pail, and, as he brought it out, said, 'Oh that aint nothing ; it's only off the cow.'" That this condition is a very prevalent one is shewn by reports of medical officers of health from widely separated parts of the country.* In Staffordshire, for instance: "The ventilation of the [cow] sheds was, in most cases, not attended to in the slightest degree. In some it was necessary to open the doors for a few minutes before going in on account of the oppressive smell and moisture-laden air ; in some there was no means of ventilation. . . . In few was there any attempt at keeping the floors or walls clean, and, in some cases, they were filthy. The hind-quarters of the cows were in a similar condition." In a county report, Dr. Reid summarizes the condition of Staffordshire dairy farms as follows:—"I may mention generally that I very rarely come across a dairy farm which is satisfactory as regards the cowsheds ; *most are ill-lit, over crowded, badly ventilated, and badly drained.*" "With a few exceptions," says Dr. Newman, "the farms in Leicestershire sending milk to Finsbury appear to be neither regulated nor registered." Similarly unsatisfactory reports come from all over the country.

From a recent report of the Local Government Board (England)† it will be seen how little control is exercised over the farms in Ireland. The dirty and insanitary condition of many of the Dublin cowsheds is specially mentioned, and the general condition of the provincial dairy farms seems also very unsatisfactory.

These are but specimens, and give only a feeble idea of the extent and nature of the unwholesomeness of sources of the food of the invalid and infant.

Some Results.

All observers are agreed that the conditions described above form the rule, and that a cleanly managed dairy farm—clean even in the everyday meaning of the word—is the exception. There are two ways of measuring the results on the health of the community. First, by means of the recorded epidemics which have been traced to milk ; and next, by the Registrar-General's Mortality Returns.

* Report on the Milk Supply of Finsbury. Dr. Newman ; 1903.

† Parliamentary Paper (Cd—833). Appendix IV.

It must be borne in mind that the study of milk as a vehicle of disease is a comparatively recent one, and that it is, in regard to many diseases, such as diphtheria, only in its infancy ; thus it will be seen that recorded epidemics probably represent only a small part of the disease due in reality to milk infection. There is little doubt but that large numbers of isolated attacks of illness are due to this cause, although no one has a suspicion as to their origin.

In 1900 the Local Government Board for Ireland issued a report on the spread of typhoid fever, which alleged that "there had been repeated and detailed observations of the spread of enteric through creamery skimmed milk." In Glasgow in 1880 there was an epidemic of typhoid which caused 508 cases and 69 deaths ; altogether no less than 200 of these epidemics were traceable to contaminated milk supplies. About 18 epidemics of diphtheria have been traced to milk-borne infection, one of the worst was in St. John's Wood in 1878 when 262 persons were attacked, and 38 died.

About 73 epidemics of milk-borne scarlet fever have been traced to carelessness or ignorance among milk producers. In most cases these were due to infection among the employees which had been kept secret, and, in some instances, it is more than probable that the cows themselves were the source of the disease.

There is little doubt but that a proportion of the tuberculous disease, which is such a scourge of modern communities, is due to the drinking of milk from tuberculous cows, or infected with dust containing the bacilli. This is especially the case with regard to the young, who not only, as a rule, drink milk more freely, but are also more susceptible than are adults.

One of the most fatal diseases from the child's standpoint is that of *diarrhœa*. In 1901, 30,121 deaths* were recorded as due to this cause alone. In London in 1902, 2,504 deaths were due to this malady. In Brighton in 1901-2 out of 226 deaths from diarrhœa, 191 were directly traceable to the unwholesome milk supply, and there is every reason to believe that this proportion holds good for the country generally. That this disease is prevalent in hot weather, that it occurs most frequently where food is liable to contamination, that it is much less common among children who are breast-fed, and that its incidence is most heavily felt by those who live exclusively on cow's milk—all point to the fact that the milk supply is the main cause of this waste of human life.

Much of the disease just referred to was conveyed by the milk, through dirty water either used to dilute the milk, or to clean the vessels in which it was conveyed. Some was traceable to dust or dirt getting into the supply on its way to the consumer ; some again to diseased people coming in contact with it. But, in addition, there is the question of diseased cows to be considered. If we take the proportion of tuberculous cows discovered in Manchester as the general average for the whole country, we shall find that about 10,800 out of 2,000,000 milch cows are affected in the udders with

* Registrar-General's Annual Report.

this dangerous disease. But experience has shewn that country cows are, owing to less stringent inspection, more diseased than those kept in towns, and if we add to this the fact that there are several other diseases in the cow which, though apparently slighter, can yet cause severe illness in the human being, we shall realise that the proportion of diseased milk-sources is much higher than this.* Under present conditions it is to the interest of farmers to hide the fact of disease among the cows, and hence the financial interest of one class is directly opposed to the health interest of another, and in this case, at least, the money wins. Any solution of the milk problem must aim at harmonizing the interest of producer and consumer, so that the occurrence of disease in an animal shall not be financially disastrous to the one or physically injurious to the other.

The Use of Preservatives.

The distance which modern town life has necessarily placed between the source of the milk supply and the consumer has not only tended to remove control from the producer, but has necessitated a growing delay between the milking and the final delivery of the milk. With the present dirty methods of production it can easily be understood that the milk, butter, and cream are peculiarly liable to decompose, especially in hot weather. Hence it has become an almost universal custom for dairymen to mix varying quantities of chemical preservatives in their milk, cream, and butter, in order that they may keep well. With a public unable to detect the taste of the added chemicals, with a complete ignorance as to the physiological action on the part of the purveyor, and with such excellent results for the trade, it can easily be understood why this custom has grown so rapidly. A Departmental Committee† in 1901 shewed that 18·2 per cent. of the milk samples examined for them, 77·9 per cent. of the cream samples, and 57·1 per cent. of the butter samples, had been doctored with such substances as boric acid, formalin, salicylic acid, or benzoic acid. In butter the common proportion is about 1 lb. of chemicals to 100 lbs. of butter; but the proportion is generally left to the "inspiring moment's care." This custom at Southampton, if we are to believe the borough analyst, is more ingenious with regard to the milk; here 1 lb. of preservative is added to a gallon of water, and 1 pint of this mixture is added to every 8 gallons of milk, so that with every tumbler of milk you take 6 grains of some sort of chemical. "Both boric acid," he says, "and formalin preparation are being increasingly used."

But Southampton is not alone in this matter. The analyst of the Dairy Trade Protection Society asserts that there is an enormous amount of preservatives used in the milk trade of London—"far more than anyone has any conception of." Most preservatizing goes on in summer, and especially on Sundays—a day that is hallowed in many ways by the dairy trade.

* Swithinbank and Newman : Bacteriology of Milk.

† Departmental Committee on Food Preservatives and Coloring Matter : Report.

The use of these preservatives is a necessary corollary of the dirty methods of production, and, while their action on healthy adults is at present unknown, it seems certain that for infants, young children, and invalids, the results are pernicious. The use of chemicals, again, while failing to arrest the growth of dangerous organisms, will hide the fact that the article is stale, and will thus encourage its consumption, even when unfit for food. In the words of the report of the Preservatives Committee: "There is further objection to the use of preservatives in the milk traffic, that they may be relied upon to protect those engaged therein against the immediate results of scrupulous cleanliness. Under the influence of these preservatives, milk may be exposed, without injury, to conditions which otherwise would render it unsaleable. It may remain sweet to taste and smell, and yet have incorporated disease germs of various kinds."

"It has been put before us that it is not possible to supply large towns, especially London, with new milk without the aid of preservatives, but we have abundant evidence to prove *that this is no more than a matter of organization and system*. No doubt the prohibition of preservatives in milk offered for sale would tend to the disadvantage of small retailers, who have no cold storage, *but this is not a consideration* which should stand in the way of a much needed reform."

Denmark has prohibited the use of all preservatives, even in the butter destined for exportation, and has had to introduce greater cleanliness of production to compensate. At one time, France also had a prohibition law, but this was relaxed with regard to export at the urgent request of the British butter trade.

Adulteration.

While the use of chemical preservatives and coloring matter in dairy produce is essentially a form of adulteration, a few persons may yet be found to defend the custom; but these are practices which no one will defend, practices which exist to a great extent—even an increasing extent—among the sellers of dairy produce. We have just seen how the consequences which should normally result from the dirty methods of production, and which themselves represent a great financial saving on the proper cost of production, are hidden by the use of chemicals. We have now to consider a less legitimate, although equally harmful custom. It may be pleaded that the use of preservatives is the result of ignorance, but such an excuse can hardly be put forward to defend adulteration. From earliest times milk has, by its very nature, lent itself to the dishonesty of the dealer. In the old days, chalk and calves' brains were said to have been added to replace quality; water was added to increase the bulk. But the use of the former ingredients have long since been given up, and the main forms which adulteration takes, are:—

The addition of small quantities of water.

The addition of separated to "whole" milk.

The abstraction of cream.

The addition of diluted condensed milk.

The business of adulteration is a highly skilled one, and has increased in cleverness to meet the demands of a growing number of public analysts. Formerly the making of a profit and the keeping up of a business connection were the two ends to be kept in view ; now detection by experts has to be avoided as well. As a guide to analysts the Board of Agriculture has fixed the standard of 3 per cent. by weight of butter-fat, below which it is illegal to sell milk as "whole." This is to ensure that the customer shall have milk of a reasonably good quality, and which has not been grossly tampered with. This standard is arrived at by experts in dairy work, and on the basis of a very large number of analyses. That the standard is a low one is shewn by the chemist to the Aylesbury Dairy Company who, after analyzing 100,000 samples, found the average of fat was 4 per cent. by weight. The amount of fat in good milk generally amounts to about 3·5 per cent. to 4 per cent. in winter, and often to as much as 5 per cent. in summer. The recommendation of the Departmental Committee to raise the standard to 3·25 per cent. is not, therefore, an extravagant one. The great drawback of indirect interference in the matter of an arbitrary standard is shewn by the fact that many members of the trade consider it legitimate to make a profit out of any fat which happens to exceed the standard amount. Hence a custom has grown up called "toning down the milk," which consists in the addition of skimmed milk to such an extent as just to reduce the percentage of fat to the legal minimum. By the addition of separated milk (*i.e.*, milk free from fat) the adulteration is rendered less easily detectable as the proportion of "solids not fat" is left normal, and only the proportion of fat reduced. In this way it is much easier to plead that the milk had only been standing, and that the cream had been taken away from the top layers by earlier customers.

In 1902*, 11·6 per cent. of the samples taken in England and Wales were reported against, and this was the highest rate recorded for ten years. The percentage of adulterations discovered in London was 15·6 per cent. In six metropolitan boroughs the percentage of adulteration to samples taken was no less than 20 ; and in the Borough of Finsbury the average percentage taken over a period of ten years was 25, or a quarter of the whole. It is always possible to raise these percentages by the appointment of a fresh and specially skilled inspector. For instance, in Islington, of 385 samples taken by the ordinary inspector, 23 or 6 per cent. were adulterated ; while out of 547 taken by a special officer, 111 or 20·3 per cent. were condemned. The multiplication of hands through which the milk passes greatly adds to the rate of adulteration. The profits of adulteration, even when balanced against the fines of the police courts, must be very great ; in 1902 the Local Government Board reported that, on the return made to them, the people of London were paying an annual sum of £30,000 for water which had been fraudulently added to their milk. If we take this basis for the United Kingdom,

* Annual Report Local Government Board, 1902.

the nation is paying about £240,000 annually to the adulterators for the water they add;* to this must be added the annual cost of the medical officers, sanitary inspectors, police courts, lawyers, etc., etc., after deducting the fines and costs recovered. It has been estimated that, at the lowest, the people of England and Wales are paying about £25,000 per annum under these heads also. It would be thought that private enterprise had done enough when it had caused the great amount of illness which dirty and slipshod methods can account for, without defrauding those who already suffer so much.

It must not be thought, moreover, that the monetary loss represents the total social cost of adulteration. To adults it may do, but it is far otherwise with regard to the infant population. For them directions are issued by means of which cows' milk is diluted and prepared so as to somewhat resemble human milk. These proportions are based upon the use of good whole milk, and when the dealers have already tampered with the milk, the mother or nurse is misled, and the modified milk sinks below the proper standard of nourishment. In this way those children who are unfortunate enough to be hand-fed may be slowly starved. There is no doubt that the high infantile mortality, attributable to dirty milk, is increased by the supply of diluted and preservatized milk.

But it should not be imagined that all the blame rests with the producer or middleman; owing to the present slipshod methods of distribution the employees on the rounds are doing their part in the general swindle. They, on their own account, dilute, give short measure, and tamper with the milk which, totally unguarded, is left in their hands. And in these circumstances the middleman is powerless, for if he prosecutes a dishonest employee he only condemns his own business, and publishes the condemnation.† Finally, there is no doubt at all as to the existence of a system of blackmail among the inspectors themselves. A recent writer‡ describes the process. "I do not think that anything is to be gained by beating about the bush in this matter, and so let me briefly state that the inspector's fee is one guinea, as a rule paid in cash, but occasionally in kind. Now there are two ways in which this transaction may be viewed. You may picture the wicked trader bribing the innocent inspector to overlook his crimes, or you may imagine the inspector threatening the dairyman with—'Your money or your reputation.' It is not very difficult to see on which side the blame lies. It is a negative advantage only which the dairyman's money gains for him. The inspector does not say, 'Give me my guinea, and I guarantee that you will *not* get into trouble,' but 'Refuse me my guinea, and I guarantee that you will get into trouble.'" This is another explanation why the full burden of adulteration never sees the light of day.

Social Reaction.

It is impossible to do more than outline, in the limits of a Fabian Tract, the present chaotic and disastrous conditions which private

* The Problem of the Milk Supply. F. Lawson Dodd.

† Vide *Economic Review*, January, 1905. Article on Milk Trade from Within.

enterprise in the supply of a commodity which is essentially suitable for collective ownership, has brought into existence. The methods of distribution are as bad as those of production ; the railway companies have no financial or other interest in the delivery of clean milk, and therefore very seldom provide proper vans for its conveyance. Fish, paint, petroleum, or any other unsuitable goods are packed along with the milk. The churns from the farms are allowed to stand for hours on platforms of rural stations to be dealt with as ordinary goods, or to await the slow milk train. While thus waiting, the milk is often exposed to the hot rays of the sun and the dust of passing traffic, which both make for increased bacterial contamination. It is improperly covered in badly shaped receptacles, which are scarcely ever locked, and from which the contents are often pilfered or polluted. Neither farmer, middleman, nor railway company cares what happens to the delicate foodstuff which they are handling, and so long as the farmer gets his price, the company its rate, and the middleman his fat profit, considerations of cleanliness and public health are little cared about. "If the Almighty had intended that there should be no manure in the milk, he would have placed the udder at the other end of the cow" represents the rural mind. "Doctors' fads" suffices for the rest. Hence, after passing on its slow and often interrupted journey, it finally reaches the poorest customer who buys it from a small shop where pickles, soap, vinegar, and paraffin are its close companions, and where, remaining uncovered, in a doubtfully clean basin, it forms the last resting place of flies, and a receptacle for the dust and dirt of the shop and the street. When it reaches the jugs of the poor in pennyworths and ha'porths, it is often as much as three days old, and is loaded with bacilli, but alas! unprotected by the souring which would have occurred had it not been for the doses of chemicals which it has received in its strange career. Good milk may contain 50,000 to 500,000 micro-organisms to the cubic centimetre: it will now be understood why Dr. Newman records the numbers in milk sold in the City of London and Holborn as 4,800,000 at a good class shop, and as 3,200,000 in a poor class shop in Finsbury. "In 1899, 50 samples of milk were examined in St. Pancras: 16 (*or 32 per cent.*) were normal healthy milks ; and 34 (*or 68 per cent.*) were unhealthy milks. Of the latter, 12 samples contained pus [matter from abscesses] in smaller or greater amount, and 5 (*or 10 per cent.*) contained the tubercle bacilli."*

In the face of such facts, which could be multiplied many times over, the urgency of the matter of milk supply is beginning to dawn on the minds of the people. But something has already been done which may be summarized here.

The Dairies, Cowsheds, and Milkshops Orders, 1885-1899, are issued now on the authority of the Local Government Board, under powers granted under the Contagious Diseases Animals Act, 1878. These orders throw upon every urban and rural sanitary authority the duty of regulating and supervizing the milk trade, and of carrying

* Report on the Milk Supply of Finsbury. Dr. Newman.

out certain general regulations prescribed by the orders. They further have the power of making and enforcing bye-laws under section 13. A register of all cowkeepers and dairymen is to be kept and revised from time to time. Before any fresh dairy or cowshed is occupied the authority must be first satisfied as to its sanitary condition; and it is made unlawful to occupy any such place if it is likely to be injurious to the cattle, or to the milk, or may afford opportunities for infection or contamination.

It is further made illegal for any infected person to take part in the supply of milk; and no dairy may directly communicate with a water-closet, or be used as a sleeping apartment, or a piggery; lastly, no milk from a cow suffering from certain specified diseases (now including tuberculosis) may be sold for human food, or for food of animals unless first boiled.

Under the provisions of the Infectious Diseases Prevention Act, 1890; and for London, under the Public Health (London) Act, 1891, sanitary authorities are given the appearance of powers for dealing with milk-borne epidemics. When such an epidemic appears the Medical Officer of Health may, after obtaining an order from a magistrate of the locality where the dairy is situated, proceed to inspect such dairy, and, if accompanied by a veterinary surgeon, the cows also. If satisfied that this is the offending dairy, he must report to his council, and they may order the dairyman to appear before them within 24 hours, and shew cause why an order should not be made forbidding him to sell his milk in the district of the authority concerned until their order is withdrawn. If the offender refuse to obey, then proceedings may be taken in his own district, and he may be fined £5 and 40 shillings for each day of default.

This measure has been found quite worthless in practice, as it takes three or four days at least to get in motion, and then further delay may be achieved by the dairyman, who would thus get time to dispose of a diseased cow. While this delay takes place the people are all the time consuming the diseased milk. In fact, promptness is the main factor in dealing with milk epidemics, and under this Act it is the very thing that is impossible. Then, too, when all is done, you have only locked the stable door after the escape of the horse, you have not *got such control as will prevent the occurrence of disease.*

Prevention of Fraud.

We have now seen what society has done to protect itself against the filthy conditions which are so prevalent in the places where milk is produced. The machinery has been at work since 1885, and very little has been done at the sources, at least, for the administration of the law is in the hands mainly of the very persons whose interest lies in its neglect—viz., the farmers. Then, too, the somewhat later attempt made to control milk-borne disease is admittedly a failure.* We will consider lastly the measure against fraud in the form of adulteration which has been in operation since 1875, and

* See Dr. Newman's Report on the Milk Supply of Finsbury, 1903.

which was strengthened in 1899, and under which adulteration seems, till quite recently, to have been on the increase.

The Sale of Food and Drugs Acts, 1875-1899, are aimed at the prevention of (a) the mixing of injurious ingredients with any article of solid or liquid food or drug, (b) the selling of any such article of inferior quality, and (c) the abstraction of anything from such article which might injuriously affect its quality. In one class of cases it must be proved that the added substance is injurious, and, in the other class, it is only necessary to prove that the article is not of the nature, substance, or quality demanded. It is under these Acts that sanitary inspectors take samples. It will be seen from what has already been said of adulteration that it is still profitable, and that this law although preventive in its action in some cases, does not seem to touch the bulk of the evil. It may be mentioned that inspectors may not take samples outside their own areas; and that the use of coloring matter and preservatives does not constitute an offence.

These attempts to control from the outside by legislative methods a trade so thoroughly disorganized, ignorant, dirtily managed, and permeated with dishonesty, have naturally failed to produce any real and lasting result, and it is certain that such measures, while acting as palliatives, will never prevent the evil or wholly remove it.

The law then is hopelessly inadequate, even if carried out to the letter. Under the Dairies' Orders satisfactory regulations have been adopted in only a few districts, and in others they are not nearly stringent enough. Those in force in London were drawn up by the old Metropolitan Board of Works at a time when the relation of milk to disease was little understood. "In the eyes of the law milk may contain large quantities of preservatives, such as boric or salicylic acids; it may shew a deposit of stable manure; it may be colored with annatto or turmeric; it may contain pus or innumerable micro-organisms, either harmless or pathogenic; it may be coated with dust from the street, or contain dead flies in suspension; it may contain saltpetre to hide the flavor of some unsuitable food given to the cow; it may be the product of a cow fed on such fermented food as brewer's grains, which renders it unfit for infants' food—it may contain all these impurities, and yet be legally 'pure milk!'"*

Certified Milk.

The Borough of Sunderland, amongst others, has started a movement for the improvement of the milk supply by means of certificates granted to those producers who fulfil certain definite conditions. These certificates, renewable from year to year, give a guarantee of quality on behalf of those who fulfil their conditions, and may be used as an advertisement. The system has not found much favor, and the ignorance of the public is at present so great that, while caring little for the conditions of milk production, they certainly do object to the added cost that is entailed by any extra precautions under the present system.

* "The Problem of the Milk Supply." 1904.

Municipal Milk Depots.

It was in France, where an increasing infant mortality accompanying a falling birth rate led people seriously to consider the question of the food of the infant population, that the first Infants' Milk Depot was started by Dr. Dufour at Fécamp under private auspices. Many local authorities, on both sides of the channel, have now followed this example. Liverpool, St. Helen's, Bradford, Battersea, and many other places have inaugurated depots in this country. The general plan in all these is to provide, at a low price, sterilized humanized milk in sealed bottles with sufficient in each for one meal. The sterilization kills the germs, and the humanization adapts the milk to infants' digestive processes. These bottles of milk are sold at a central depot, and, in the case of Liverpool, at about 30 dairies as well. In this last named place 3,000 bottles per day have been sold. The cost to the parent for the food of one child is about 1s. 6d. to 1s. 9d. per week, and in Battersea about 400 children are being fed.* By far the best municipal milk supply is that established in the City of Rochester, U.S.A., in 1897, and, as it shews the main lines on which all public supplies should be carried on, it will be useful to describe its method of working. "A central station at which the milk is prepared is organized each [summer] on a farm outside the city, where a trained nurse and assistants have full control of the cows, utensils, bottles, etc., and where all of the milk-work is carried on in a portable milk laboratory. Everything coming in contact with the milk is thoroughly sterilized in steam sterilizers. The milk itself is not subjected to any Pasteurizing or sterilizing process. Sterilizing and Pasteurizing are only an open invitation to the milkman to be careless in the production and handling of milk.

"At the milk station on the farm the milk is taken from clean, well-fed, tested cattle, into sterile cans which are carried to the farm in sterile cheese-cloth bags. Just before milking, the cows' udders are washed. A sterilized cheese-cloth fly cloth is placed over the cow, the first portion of the milk being rejected. So soon as the cans are filled they are immediately covered by a layer of cheese-cloth held in position by a rubber band. The cans of milk thus covered are immediately taken from the barn into the laboratory, about 200 yards away, where the milk is properly diluted, sweetened, and turned off into sterile nursery bottles of various sizes of the Siebert type. The bottles are corked with sterile rubber corks, placed in racks, covered with cracked ice, and immediately transferred to the city for use. Of the cleanliness of milk prepared in this way, forty-three daily samples were found to average not more than 14,000 bacteria† per cubic centimetre, while the city milk for the same period approximated 235,000 bacteria per cubic centimetre."‡

* Annual Reports on the Health of Battersea. 1903 and 1904.

† *Cp.* number found in London milk noted above.

‡ "The Influence of Municipal Milk Supply on the Deaths of Young Children." Dr. Goler, Health Officer Rochester, N.Y., U.S.A., *New York State Journal of Medicine*, 1903.

Of most municipal milk depots it must be said that they are only attempts to solve a great problem, but, though small, they go in the right direction. Good has been done, but it is little, owing to the following reasons :—

1. The farms are not under the control of the depots, and hence sterilization is necessary, although in itself bad.

2. The sale of only one kind, viz., modified milk, reduces the usefulness, as those who wish to prepare their own infants' food get the unwholesome milk of the ordinary dairy.

3. There is no system of advising each mother, and supervizing the growth of the child as is the case in Paris.

4. They do not touch the really important point, which is the clean production and general organization of the milk supply of the poor.

5. No help is given to the deserving mother, suckling her own child, who therefore needs extra nourishment for herself, and often finds it impossible from lack of food to continue in this right course.

Private Experience.

Many attempts have been made by private enterprise with varying success, and recent revelations in connection with one of the best companies in London have shewn that they in no really efficient manner protect the public from danger.* In York a pure milk supply has been carried out on commercial lines, under a skilled and intelligent dairy farmer, and so great has been the demand that prices have had to be raised above the ordinary market rate to choke off business. In Paris, Dr. H. Rothschild has organized a supply of pure sterilized milk which is sold in several depots in the poorer districts, the demand is very great, and continually increasing owing to the quality, cleanliness, and price of the milk sold ; but although this milk is supplied at a much cheaper rate than at other dairies the profit made is considerable, and that the benefit has been great is evidenced by the vital statistics of the city. Another instance of a useful attempt to solve the problem by private effort is that afforded by the Copenhagen Milk Supply Company under the able direction of Mr. G. Busck. This company pays a limited dividend of 5 per cent., and the managing director expends much time, energy, skill, and experience without any remuneration. It has not only improved the quality and sources of the milk, but has successfully prevented the attempts of other companies to form a corner to raise prices. Another valuable work done to supply pure milk to the very poor is that of the Hon. Nathan Straus in New York. He has succeeded in giving good milk at reduced cost to the poor by means of careful organization of supply and distribution.† It is needless to enumerate more cases. Two main facts stand out prominently to the student. First, all attempts at improvement on

* Vide case of Typhoid Fever caused, in the opinion of the jury, by the Milk from a farm on the books of the Aylesbury Dairy Company. *Frost v. Aylesbury Dairy Co.* Court of Appeal, Feb. 1905. *Times Law Reports*, p. 300.

† Infant Mortality and Infants' Milk Depots, p. 68.

present lines of distribution inevitably keep up and raise the market price of milk. The second point is that wherever improvement has taken place and the price has been kept down or lowered, the undertaking has not only been on a large and carefully organized scale, but there has always been an absence of the mere commercial element. Dr. Rothschild and Mr. Busck both bear testimony to this.

The Lines of True Reform.

Mention has already been made of the municipal milk depots established in many large centres of population. These have commenced the work of public supply; and the next move must be to enlarge their basis and increase their control over their sources of supply. Hence, each town should have a municipal milk depot for the sale of milk of all kinds—whole, separated, buttermilk, cream, and other dairy produce—connected with a farm under the same ownership and control. These depots should be situated in the poorer districts, and they should sell the articles at a cost covering production and distribution. To secure freedom from adulteration, all the employees should be well paid, and the milk should be distributed in sealed cans and bottles to the depots or the consumers. At first it might be made compulsory for the customers to fetch their own milk, and thus save the cost of delivery, as at Dr. Rothschild's depots in Paris. The municipal farm should also supply pure milk to all public institutions, whether officially or privately managed, such as fever hospitals, asylums, workhouses and schools. In connection with the elementary schools it would be advisable to follow the suggestion in the Report of the Scottish Physical Training Committee: "It would in many cases be an inestimable advantage could regular and sufficient meals—such as broth, porridge and milk, or bread and milk—be provided at a minimum cost"*; or to obtain half a pint of milk for each child at least once a day. Such an arrangement would secure a saving on the cost of the milk purchased from the contractors, and would prevent such epidemics as have occurred even in the largest London hospitals. This is no new idea. The Corporation of Nottingham, for instance, supplies its asylum from its own herd of cows, and receives about £2,500 per annum for the sale of milk and butter. In 1903-4 the Birmingham Drainage Board took £1,894 for the sale of 61,404 gallons of milk produced on their sewage farm; and at Reading the same thing is done. It is imperative that all such institutions as have just been mentioned should have an unimpeachable milk supply; and the only way to ensure that is by giving them one under the direct control of the local sanitary authority. If the physique of the poorer classes is to be built up, it is essential that their food should be both good and cheap, and this applies especially to the milk supply. The milk produced on the municipal farm would be distributed to the local depots, and the extra cost of clean and healthy production would be saved from the profits of the middlemen and the loss entailed in bad organization.

* *Vide* Report, p. 30.

These model farms should be run in connection with the technical schools, and the science and art of dairy-farming taught under the most favorable conditions. It is certain that no mere tariff interference can prevent the loss of an industry carried on in a way which not only displays technical ignorance, but also want of organization, combined with practices which are injurious to the public health.

The establishment of municipal milk depots supplied from municipal farms is the first step towards the social organization of the dairy industry; and this would inevitably lead towards a complete organization of the supply. Well-to-do people would soon purchase their milk from stores which they could rely upon, and each successive increase in demand would render the whole process more economical, and hence a lowering of price possible. The community would take over the whole of the supply, and production as well as distribution would be completely organized on one system. The milkman would be on the same footing as the postman, and his rounds would be as regular, although their frequency would be greatly reduced, owing to the better keeping quality of milk produced under clean conditions, and also to the fact that all milk would be bottled at the farms after being cooled, and thus protected from the sources of pollution which under present methods are so harmful. The number of carts and men and shops would thus be lessened, and the saving could be used to improve the article or lower the price. The number of hands through which the milk passes would also be reduced, and hence the possibility of infection or contamination made less. The sources of supply—the cows, farms, farm-hands, etc.—would be under control and supervision, and epidemics could be entirely avoided. Encouragement would be given for honesty on the part of the men in case of infectious disease existing in their homes or families; they would be paid the usual wages even when not at work if they gave the needed information, and punished if they failed to give it. The presence of disease amongst the animals would be known, and precautions would be taken to isolate the cow if curable or to destroy it if incurable or dangerously ill. Such a decision would be arrived at easily when there was no question of bringing serious financial loss to one man in the interests of the many; the community would lose the animal, but the community would gain the immunity; whereas, under present circumstances, if anything at all happens, it means that the gain of the one is made the loss of the other. The industry would for the first time be put into the hands of skilled persons, and controlled in the interest of the public health. What has happened to water will take place in regard to milk, with the same beneficent results.

The most important industries should be put under public control first. It was epidemics and not epigrams that caused the municipalization of the main sources of our water supply. If tramways or electricity are mismanaged, the public reap inconvenience in transit or lighting; but if the supply of milk is mismanaged—as has been shewn to be the case—the community reaps disease and physical degeneracy in its youngest members, as well as death and

misery resulting from the frequent epidemics amongst the adult population. It is only necessary to convince the public that it can no longer afford to drink dirty and expensive milk in order to support its adherence to a worn-out and obsolete economic theory.

PUBLISHED AUGUST 1905. REPRINTED FEBRUARY 1908.

STATE CONTROL OF TRUSTS.*

THE common use of the term "Trust" is not marked by any scientific precision but rather conveys an abusive by-meaning. Here we shall use it to denote all organizations designed to control competition, whatever be their form, and whether intended to be temporary or permanent in duration. It thus includes not only the huge amalgamations of many businesses, where the original firms are replaced by one permanent company, but also the temporary syndicates, associations, or kartells, where the associated manufacturers bind themselves by private penalties for specific objects for definite periods of time, but otherwise retain their separate individuality. Whether they are simple associations to fix rates of discount and terms of delivery, or price associations, or syndicates to pool output, or associations to concentrate the sale of the products of the combining firms, these terminable associations are marked by the surrender of a progressively increasing share of independence, of freedom to compete. At last, with the amalgamation, we have the complete extinction of competition.

The Abolition of Trusts.

Such a thorough reversal of the industrial principle, whereby the benefits of improvements passed to the consumer through the rivalry of competing producers, could hardly be received with favor; and it is not surprising that the first impulse has been to prohibit the new development as dangerous to the community. Destructive legislation has completely failed. In Austria kartells have sometimes disguised themselves as scientific associations in order to evade the law. In the United States anti-trust legislation has been voluminous and futile; when the original "trust" form was declared illegal it gave way to the company form, which so far has shown itself impregnable. The Sherman Act of 1890 and the supplementary Act of 1894 forbid all combinations in restraint of interstate or foreign or import trade, all attempts at monopoly of interstate or foreign commerce, and all contracts intended to restrict competition in or increase the prices of imported articles. Twenty-seven States and territories have passed laws against monopolies, and fifteen have anti-monopoly articles in their constitutions, while others rely on the common law. In the Addyston Pipe case of 1899 the combination of manufacturers in different States to fix prices was declared illegal under the Sherman Act, and similar combinations within a State have been suppressed by State laws. Even then a verbal understanding, "a gentleman's agreement," remains unaffected, even though it is as tyrannous as that of the six Chicago packing-houses, the so-called "Beef Trust." The large amalga-

* Reprinted, with some alterations, from the *New Liberal Review*, September, 1903

tions have escaped unscathed ; except that in Illinois in 1899, on the petition of several shareholders in the American Glucose Co., an agreement to sell out to a new corporation, the Glucose Sugar Refining Co., was set aside so far as concerned the American Glucose Co.

Trusts and Railways.

The direct attack having thus failed, attempts have been made to destroy trusts by removing their supposed causes. The Final Report of the Industrial Commission of the United States says : "There can be no doubt that in earlier times special favors from railroads were a prominent factor, probably the most important factor, in building up some of the largest combinations." In order to prevent such discrimination the Inter-state Commerce Act of 1887 was passed, prohibiting the combination of railroads for the pooling of freight or to prevent through shipment of goods. It also, to quote the above report, "places upon inter-state carriers a prohibition against unjust or unreasonable rates and against unjust discrimination, but otherwise leaves them as free as they were at common law to make special contracts looking to the increase of business, to classify traffic, to adjust and apportion rates so as to meet the necessities of commerce, and generally to manage their own business in their own way. The commission appointed under the Act is not authorized to fix rates. . . . But its powers as thus defined are not extensive, and perhaps the criticism of Mr. Justice Harlan is justified, that 'it has been shorn by judicial interpretation of authority to do anything of an effective character.'" President Roosevelt now proposes legislation to prevent secret rebates and unjust rates, but he has to face the vehement opposition of the millionaire party, and there is no security that the administration of the new law will be more efficient than that of the old. Preferential railway rates may favor the growth of trusts, but their absence does not prevent it, as is shown by the spread of combination in Germany where the railroads have been nationalized, and in Britain where discrimination is illegal.

Causes of Combination.

The most popular view of the origin of trusts is that which declares, with Mr. Havemeyer of the Sugar Trust, that "the tariff is the mother of trusts." In one sense this is true, where the industry itself has been created by a protective tariff, but as a general proposition it is incorrect. Some of the most successful American trusts, like the Standard Oil Company, owe nothing to the tariff, and our own British combinations have, of course, grown up under free trade. The truth about the tariff is that it creates the home industry, and by making high profits possible behind its protective wall attracts an unnecessary number of manufacturers into the trade, whose violent competition produces such a state of things that combination is the only outcome.

There are two main causes of combination, the attempt to escape from the consequences of excessive competition, and the desire to realize the economies of large-scale production. From their opera-

tion we cannot escape, and we must, therefore, regard the limitation of competition as a natural development culminating in the production of private monopoly, either complete or partial. Such monopoly is marked by the unified control of business over the whole or a part of the industrial field, and is specially directed towards prices. Only the socialist welcomes this result, and he only because he sees himself in the position desired by the Roman tyrant who wished that all his enemies had but one neck. It is not enough to dismiss the problem with the dictum that public monopoly must supersede private monopoly. For such a conclusion the public mind is not yet prepared, nor is the State machinery at present fitted to cope with industrial administration. If we believe that in the end industry must be managed by the State, we must prepare the way by the gradual development of control; if, on the other hand, we hold that the organization of industry must remain in private hands, we must purge it of manifest evils. In either case we must guide our action by the endeavor to maintain the advantages of the unified control of industry, and these, over and above the usual economies of a large business, are the prevention of the waste of competition, the specialization of plants, the better organization of talent, the application of all the expert knowledge in a trade to every establishment in the trade, and the better organization of sales.

Trusts and Prices.

Apart from any injury which may be done to the State in its corporate capacity, there are four classes of persons who may be damaged by a trust—the rival producers, the consumers, the employees, and the investors. With the first of these we are only concerned so far as an injury to them may lead to greater loss to the consumer, or where the methods of competition offend against the public sense of honesty. Their interests and those of the consumer can be treated together in relation to the general policy of trusts with regard to prices. The common belief about trusts is that they exist for the purpose of forcing up prices, and every rise in the price of an article produced by a trust is regarded as an exercise of their malignant power. The advance which almost invariably follows the establishment of a trust is adduced in support of this belief, regardless of the fact that comparison is made with prices so low as to be unprofitable. An increase in such circumstances is quite as justifiable as one motivated by a rise in the cost of raw materials. Nevertheless, it must be admitted that the hope of securing higher prices is one of the chief inducements to combination, and the extent to which this can be done requires our attention. The law of monopoly price is that the monopolist will charge not the highest price, but the price which will call forth the demand productive of the largest net revenue. The maximum profit, being thus a function of two variables, may be produced by different combinations of these, but the motive which will cause the monopolist to prefer a larger supply at a lower price to a smaller supply at a higher price is the fear of creating competition. Mr. Havemeyer

put the matter quite bluntly to the American Industrial Commission when, after declaring that he did "not care two cents for your ethics," he said: "As a business proposition it is right to get all out of business that you possibly can. If you get too much of a profit, you get somebody in competition." The monopolist price will be higher than that which will produce the ordinary profit gained under the rule of free competition. Thus Mr. Archbold, of the Standard Oil Company, when asked, "By virtue of your greater power you are enabled to secure prices that on the whole could be considered steadily somewhat above competitive rates?" replied, "Well, I hope so. Undoubtedly there is an ability, and when that ability is unwisely used it is sure to bring its own defeat." The degree to which competition is capable of reducing the power of a trust is strictly limited. The possibility of effective competition depends largely on the amount of capital which is required; thus, for example, it would be difficult for a new firm to compete with the United States Steel Corporation. And, so long as the trust continues to manufacture a necessary portion of the supply it can obtain its own price for it, though all the time outside producers are marketing all their product at a lower price. Thus, the Durham Coal Sales Association in 1894 was able to maintain the price of Association gas-coal at sixpence a ton above that offered by the non-associated collieries. Nor, except in exceptional cases, can reliance be placed on a shrinkage in demand, or in a shifting of demand from the trust-produced article to an alternative article. The slowness of the American coal consumers to use soft coal instead of anthracite for domestic purposes, even under the pressure of the ruinous prices of the summer and autumn of 1902, well exemplifies the conservatism of the consuming public. A trust can more quickly take advantage of a rising market and offer a longer resistance to a fall than a number of separate establishments can. It is also not under the same compulsion to give away in reduced prices the savings resulting from improvements in manufacture; in fact, the possibility of retaining these extra profits is the great inducement for a trust to seek better methods, and the Sugar Trust avowedly for years retained such profits, for, as Mr. Havemeyer said, "it was none of the public's business," and when prices were lowered that was "business policy again, and not philanthropy."

It is difficult to estimate how far there may have been an increase in prices due to trusts, or how far that has been hurtful. From the Report on the Statistics of Labor for 1901, for Massachusetts, it appears that between 1897 and 1902 the cost of living for the working classes had risen 15·37 per cent., *i.e.*, food 11·16 per cent., clothing 16·07, rent 52·43, fuel and light 9·78, the expenditure on sundries in each year being put at the same proportion of income. These increases represent the movements in retail prices, the rise in wholesale prices being 36 per cent., and both are higher than the increase in general wages, which between 1897 and 1901 was 6·6 per cent. In Germany the kartells have shown themselves guilty of far greater extortion; it is enough to quote the sugar kartell. Some have tried to measure the loss to home con-

sumers by a comparison of prices charged to home and foreign customers; thus American shipbuilders were paying \$1.65 for steel which at the same time was exported to be sold in England at 95 cents, while during the last two years the English iron trade has been disorganized by German iron dumped on our markets at or below cost price. This practice is defended by the assertion that the lower average cost of production of the larger output enables the quantity sold at home to be sold at a lower price than otherwise could be afforded. It is also the natural device of every manufacturer who tries to get a footing in a new market, or in one where he meets with strong competition, or when he has a surplus to dispose of, and is used by associations in free trade as well as in protected countries. Thus, Messrs. Denny and Co. say* that the Scottish Plate-makers' Association is prepared to sell boiler-plates abroad at £1 per ton below the home price. On the other hand a trust or kartell dealing in raw or semi-manufactured materials may, by selling abroad at low prices, injure a home trade which works up these same articles into the finished product; thus the Gerresheim Glassworks proprietors complained† in 1901 that their trade was falling off because their foreign competitors could get German coal at a lower rate than they had to pay. Obviously, the crux of the problem lies in the justice or otherwise of the home price. An important point is that the greatest sinners in the way of prices are not the great amalgamations, but the looser associations, syndicates, or kartells. A comparison of the range of prices during the earlier iron and steel pools in the United States, or of the price policy of the German kartells, with the more conservative conduct of the United States Steel Corporation is enough to establish this fact. Indeed a temporary organization, just because it is temporary, must force up prices and make hay while the sun shines, while a permanent combination must take longer views. Nowadays all the American trust magnates profess their belief in low prices.

Tariffs and Prices.

Before dealing with the normal regulation of prices we must first touch on any artificial conditions which strengthen the power of trusts. The chief of these is unquestionably a protective tariff. It is that which enabled Mr. Schwab to obtain \$27 for steel rails costing \$16 a ton. In Britain we have not had to complain of trusts raising prices because we have had the foreign producer to fall back on. The "infant industry" plea no longer holds good over large tracts of industry, and it is admitted that those iron and steel products, the labor-cost of which is low, no longer require a protective duty in America. We do not need to take the extreme view that the full amount of the import duty is always added to the cost of production and so levied from the consumer; how much will be added will depend upon the interaction of the duty and other coincident factors tending to reduce prices. In Germany the tariff seems to be very fully utilized, but in America it is not to the same degree; thus the

* *Glasgow Herald*, November 12, 1902.

† *Das Grundgesetz der Wirthschaftskrisen*. R. E. May. (Berlin, 1902.)

price of tinplate in the States has gradually approximated to the price abroad. Dr. Grunzel, the secretary of the Central Union of Austrian Manufacturers, puts the whole case very simply :* "An industry organized in kartells can exploit a protective tariff better than one not so organized, and therefore can do with a lower import duty."

One particular method of effecting tariff changes can, however, not be approved, that set forth in a Canadian Act of 1887. If the Governor believes that prices have been unduly raised owing to the operations of a trust, he may, after causing an inquiry to be held by a Judge of the Supreme Court, reduce or suspend the import duties on the articles in question. In virtue of this Act, the tax on imported printing paper was reduced from 25 to 15 per cent. *ad valorem* in February, 1902. Similar powers have been conferred by the Tariff Act recently passed by the Parliament of the Australian Commonwealth. This method throws the whole tariff policy into doubt and confusion, and thereby inflicts serious injury on trade ; and since production by trusts now extends over a very wide range of commodities, it has the grave constitutional defect of removing the most important industrial questions from the legislative to the administrative branch of the Government. The same objection applies to the introduction of anti-trust clauses in commercial treaties. If a tariff is to be altered at all, it should be altered at proper intervals, after due notice, and not too frequently, instead of in a sporadic and irregular fashion.

We may, therefore, conclude that where a tariff exists the surest way of preventing extortionate prices is to lower or abolish the import duties, and that where trusts exist in a free trade country, there are the strongest reasons against adopting a protectionist policy. Trusts we can put up with when modified by foreign competition ; protection we might endure, if domestic competition kept down prices ; but both together are too much for any nation. We, in this country, have already experienced what monopoly meant during the coal boom.

Unfair Competition.

There are certain forms of price policy which are commonly adopted in the competitive world without doing very much harm, but which, in the hands of a trust, become instruments of tyranny.

There are three ways [says Professor J. B. Clark,†] in which a trust can crush an efficient competitor. The rival may be producing goods cheaply, and he may be the man who normally ought to survive ; and yet the trust may ruin him. It may make use of the "factors' agreement," by which it gives a special rebate to those merchants who handle only its own goods. It may be resort, secondly, to the local cutting of prices, whereby the trust enters its rival's special territory and sells goods there below the cost of producing them, while sustaining itself by means of higher prices charged in other portions of its own field. Again, the trust may depend on the cutting of the price of some one variety of goods which a rival producer makes, in order to ruin him, while it sustains itself by means of the higher prices which it gets for goods of other varieties.

* *Ueber Kartelle*. (Berlin, 1902.)

† "Monopolies and the Law." *Political Science Quarterly*, Sept., 1901, p. 467.

The most familiar example of the tyranny of rebates is given by the shipping rings, which have thereby inflicted enormous injury on British trade. Merchants shipping goods to South Africa by independent vessels not only lose all of the 10 per cent. rebate granted for exclusive patronage of the ring which they may have earned, but are also charged double or quadruple rates for any shipments they may be compelled to make by "ring" vessels. Messrs. Denny and Co., of Glasgow, again, recently reported an attempt made to force shipbuilders to deal only with the Platemakers' Association, by refusing supplies to those dealing with outside firms. This tyrannical conduct only drove Messrs. Denny to Germany. Other charges are that "the Associated Boiler-makers' ring . . . while holding out for inflated prices for boiler-plates, was underselling in the ship-plate market."* In America the rebate policy was one of the most effective weapons of the Tobacco Trust, and differential prices were freely charged by it, as well as by the Petroleum, Salt, and Photographic Trusts.

The United States Industrial Commission recommended :

That stringent laws be enacted by the Congress and the several State legislatures, making both penal and criminal the vicious practice of discriminating between customers, and cutting rates or prices in one locality below those which prevail generally, for the purpose of destroying local competition ; and that such laws should give to any person damaged the right to sue for and recover prescribed penalties, and make it the duty of prosecuting officers to proceed against the offenders.

Professor Clark also urges the desirability of penalizing these practices, and seeing the extremely great difficulty of enforcing such laws, he advises that the commission of any one of these offences should be held proof of monopoly, thus, according to the common law of the United States, leading to the outlawry of the trust. His object is to keep alive the effective competition of efficient producers and to give reality to potential competition, which to-day are neutralized by the unfair advantages of the trusts. In this way he hopes to prevent monopoly and to escape from the ultimate nationalization of industry. Even those who do not share his hopes must agree that it is more consonant with the interests of the community that the trusts should develop solely through their efficiency as producers and not by the brute power of their wealth, and must therefore share his condemnation of trust tyranny. But in prohibiting those practices our whole view of industry is changed. It is no longer a means for securing the private gain of the individuals engaged in it, but the performance of a public service which requires all persons to be treated alike, and makes the managers responsible to the public for their whole conduct. To enforce such prohibitory laws would demand the most persistent vigilance on the part of the public, and in view of the many forms which evasion can take the best we can say is that enforcement is not absolutely impossible. In the matter of shipping rebates, the situation is much simpler than elsewhere. The case is made out for their prohibition, and we have additional weapons at hand in the grant of

* *Financial Times*, March 13, 1903.

postal and naval subsidies. Already in the Cunard subsidy it has been made a condition that the company is "not to unduly raise freights or to give any preferential rates to foreigners."

Anti-Trust Combinations.

When we have pared off these excrescences of price policy, we have still to face the fact that trusts can keep prices somewhat above competitive rates, and we may anticipate that they will prefer a steady "squeeze" in this way to sudden raids on the public purse. A trust can be met by combination among its customers, who are thus able to oppose a unified demand to a unified offer, or even to undertake manufacture co-operatively for themselves. The Austrian glass and soap workers in 1897 started a co-operative soda factory in opposition to the soda kartell, and in 1901 the mere threat of such action enabled the millers to win concessions from the Austro-Hungarian jute kartell. Early in 1902, the Union of Austrian Manufacturers, wearied of the monopoly of the coal commission houses, started an agency of their own, Gerich and Co., to purchase coal and coke as directed by the Union, to be sold to members at a price just enough to cover expenses. Last year a syndicate of Clyde ship-builders started a nut, bolt and rivet works in opposition to the Scottish Rivet, Nut and Bolt Co., an amalgamation including most of the firms in the trade, but it has not been a success. A more significant experiment is the Piece Dyeing Trade Board of Bradford, constituted last spring of an equal number of representatives of the Bradford Dyers' Association and of the merchants, their customers, the latter appointed by the Bradford Chamber of Commerce. An independent umpire or chairman is provided for, and, while the merchants agree that the Association is entitled "to a first preference in respect of dyeing work," it is stipulated "that any difference or matter of dispute arising between the Association and their customers shall, if not capable of settlement between the parties, be referred to the committee for their arbitration, and their decision shall be final." In all these arrangements, however, the interests of the ultimate consumer are left out of sight, and it might well be that if an industry were controlled by a chain of trusts each strong enough to hold the others at bay, they would come to an understanding which would work to the detriment of the final purchaser, for it must not be overlooked that the relations between the trusts are every day becoming closer.

The establishment of a counter-trust might be a comparatively easy matter in the case of manufacturers who work up semi-manufactured products, but it is much more difficult among wholesale dealers and almost impossible among retailers, whose interests are too diverse and whose relations with each other are too uncertain to permit of effective joint action. In the retail trade the tendency is to frame agreements with the manufacturers and wholesale houses to fix retail prices which are enforced by the boycott of undercutters. Abundant examples of such agreements in this country may be found in the drug, grocery, and baking trades, and the tobacco retailers are still trying to secure a similar arrangement. Naturally the interests

of the manufacturers and retailers are alone considered in these alliances. To some extent the consumer can and does find a defence in the co-operative movement. Yet though co-operators have gained great benefits from their mutual support and will in future gain even greater, the movement is not strong enough to defeat the trusts and revolutionize the industrial system. Trusts spread faster than co-operation, which is practically confined to the factory workers, and though the capital engaged in co-operative production is large, it is only a drop compared to the industrial capital of the country. The co-operative stores can cope with the retailers even though, as at present, some manufacturers withhold their goods, but they cannot get control of the sources of raw material, and the heavy lines of manufacture are quite out of their sphere.

Regulation of Prices.

In the final resort we come to the State regulation of prices. To do so we must take a great leap in advance of public opinion, and even after having performed that feat we are still in the midst of difficulties. No Government department could possess the knowledge requisite to enable it to fix prices in a number of industries differing in all their circumstances. Only an intimate acquaintance with the course of the markets, to be acquired only from daily work in each trade, could give that capacity. Besides, it is a safe assumption that the best talents in any industry would be engaged in the practice of that industry, and that only, at best, second-rate abilities would be available to exercise such important judicial functions as are involved in the fixing of prices. One might almost say that State management of industry would be simple compared with the fixing of prices. Many of the trusts could even now be taken over by the State with as little dislocation as followed on the nationalization of the telegraphs. "We might even add," says Professor W. J. Ashley,* "that in the case of the Standard Oil monopoly, the development has already reached a point at which, on the purely economic and administrative side, there could be little objection to the Government taking over the business—if only there were a Government politically capable of the task." Perhaps the Wall Paper Manufacturers' Association and the Fine Cotton Spinners' and Doublers' Association approximate to the same condition. The problem is made little easier if we seek to limit prices by limiting the rate of profit, though there are precedents in our dealings with gas companies. Herr R. E. May of Hamburg is a strong advocate † of the limitation of profit to, say, seven per cent., and to meet the objection that this would sterilize progress, he would allow an additional one per cent. where improvements had been introduced, deducting a like amount where no effort had been made at development. The administrative difficulties would be immense in deciding what was admissible as an improvement, and in coping with juggles as to capitalization, depreciation, and reserves, nor must the doubtful result on the money market of such fixing of profit be overlooked.

Supervision of Trusts.

It thus seems conclusive that the State can only effectively regulate prices by assuming the management of industry, but nevertheless some attempt at regulation may be anticipated. The plan most likely to work well is that sketched out by Dr. Grunzel, and as it comes from a believer in combination, and an official of a manufacturers' association, it is worthy of attention. He deals only with kartells or syndicates, not with amalgamations, and he would compel them all to be registered and to file their statutes with a State department. Registration would confer on kartells full legal capacity, including the power to sue members for breach of contract, which they cannot do at present in Austria, Britain or America.

The supervising department would be empowered to hear all complaints and to take cognizance of all acts contrary to the public interest; it would have the right to conduct enquiries and to call for explanations; and if the offending kartell did not amend its ways it would be struck off the register and thus cease to be legalized. The same procedure might be extended to amalgamations, though Dr. Grunzel does not go so far, for, though an amalgamation cannot be dissolved like a kartell, it could be refused the aid of the law courts in enforcing contracts, as, for instance, has happened to illegal combinations in Illinois. We may find a precedent in our own Railway Commission, though experience of that body shows that while effective in repressing injustice or excess, this method might be inoperative in dealing with rates or prices which inflicted injury on the community, as apart from individuals. Control would be strengthened by the constitution in different industries of arbitration courts, with the help of the Chambers of Commerce, similar to the Piece Dyeing Trade Board. The shipping industry would certainly seem to afford a good case for experiment in this direction. The alternative to State supervision of kartells or associations is that we must rely for the prevention of monopoly or oppression on dishonorable members who break their agreements. That happens often enough, but it does not conduce to a high moral tone in industry. It is only the abuse of combination which requires to be suppressed; combination itself is to be welcomed as leading to improved industrial organization and the contract of combination should be enforceable like any other.

Trusts and the Workers.

As with prices so with wages, the power of the trust seems at first to be absolute. A great corporation could lock out a section of its men permanently if it could keep its other works going; it could, and sometimes does, move a branch from one town to another and so has an effective weapon of punishment at hand; even in the ordinary process of concentration it inflicts suffering by the closing of unnecessary works; the terror of the "black list" is multiplied. But, on the other hand, the American anthracite strike has shown that public opinion can force even a trust to give way, and there is also the certainty that it would not be economically advantageous to force down wages, since without high wages the

care and skill cannot be secured which are needed in the handling of expensive and complicated machinery. Lastly, the working man has a much keener sense of his interests as an employé than the consumer has of his interests as a consumer, and a trust would think twice before carrying out an anti-labor policy which would send the workers flocking to the polls to vote for anti-trust candidates. So far as American experience goes the fears of an anti-labor campaign scarcely seem justified. The final report of the Industrial Commission says :

The evidence before the Commission indicates that the great majority of the combinations recognize trade unions and deal with their representatives in fixing the wage-scale and conditions of labor. . . . So far there seems to be no indication that the combinations are attempting to lower the wages of working men. The attention of the Commission has not been called to a single instance of an attempt on the part of the combinations to reduce wages generally. In fact, the combinations have, apparently, raised wages as willingly as individuals, and given their employees privileges of all kinds with no more hesitation. The investigation made by the Department of Labor shows that combinations have raised wages slightly more than other employers of labor in the same industry.

Too much must not be deduced from these facts, for American trusts have only experienced prosperity, and it remains to be seen whether in a period of depression they would not use to their own advantage that stronger strategic position which concentration gives them. That is all the more to be feared in Britain, since, as one of our judges has said, it is now almost impossible to conduct a strike without illegality. It therefore becomes necessary for the State to guarantee the minimum standard of life just as it prescribes a minimum standard of safety, and to provide for the scientific settlement of industrial disputes by arbitration. For these purposes it is urgently necessary that the trade unions should increase their membership, and devote their energies to political action. It is true that Mr. Baer, the president of the Reading Company, assured us during the American anthracite strike that "the rights and interests of the laboring man will be protected and cared for, not by the labor agitators, but by the Christian men to whom God in His infinite wisdom has given the control of the property interests of this country," but on the whole the working classes will probably prefer to supplement this fatherly care by the protection of the State.

Protection of Investors.

The investor in bubble companies is scarcely an object for much pity, and many would consider that the losers from over-capitalized trusts have little claim on public sympathy. Yet it is to the public interest that industry should have a sound financial basis, and that commercial confidence should not be shaken by the frequent collapse of water-logged businesses. The late Lord Russell's stinging denunciations of company-promoting frauds and questionable practices are not yet forgotten. In the United States the position is much worse, for there the law does not require the disclosure of the amount of purchase money, assets, earning capacity, or promoters' profits.

The larger combinations usually issue to their stockholders once a year an annual report regarding the business. This report, however, is frequently in terms so general that it is difficult to learn much regarding actual conditions. This secrecy in promó-

tion, combined with very large capitalization, gives a great advantage to directors and officers of the combination and others associated with them in knowing the value of the shares. There seems to be no doubt that in many instances the promoters of combinations have been able to unload large blocks of stock at prices far above their values, as shown by later experience.

But the Industrial Commission Report continues, "it is probable that the period of the most excessive capitalization of corporations has passed," for bankers and investors, warned by experience, are insisting on "more and more information." This improvement comes too late for a large number of heavily over-capitalized trusts which at the first breath of adversity will pass into the hands of receivers and be reconstructed. Afterwards, like the American railroads which have gone through the same process, they may become sound and prosperous. Meantime, the attempt to earn dividends on an inflated capital tends to keep up prices.

The American ideal at present seems to be to bring their joint-stock company laws up to the British level. The Industrial Commission recommended :

That, to prevent over-capitalization, the several State legislatures enact laws similar to the anti-stock-watering laws of Massachusetts; also to provide for State supervision of all public service corporations, with power to recommend or regulate rates for service, and to pass upon the public need, desirability, or exigency of any proposed new service.

These laws require that stock must only be issued for cash or for value in actual property, and the directors must obtain from the State Commissioner of Corporations a certificate that he is "satisfied that the valuation given within is a fair and reasonable valuation for the property described." The value of patents would appear to be admissible in such valuation, but not that of goodwill or trade marks. Yet this exclusion would seem to be unfair, since goodwill, if reasonable, measures earning capacity, and would only serve to send up market prices above par. To get a State valuation of goodwill does not appear feasible, and, where ordinary stock which includes goodwill is taken by the vendors, it is unnecessary. It is enough to require that all information should be given necessary to enable the investor to protect himself, and then to ask that he should exercise reasonable caution in his investments. If, as in the case of the English Sewing Cotton Co., investors are ready to pay £457,000 for the goodwill of businesses that are admittedly "in serious difficulties," it is difficult for any law to protect them. The only other proposal, beyond the adoption of the British law made by the Industrial Commission to ensure publicity, was that "the larger corporations—the so-called trusts—should be required to publish annually a properly audited report . . . such report and audit under oath to be subject to Government inspection" in order to bring to light any irregularities or illegalities. To this there can be no objection—there is an American precedent in the State inspection of banks—but under the Companies Act of 1900 auditors in Britain have already very full powers and very serious responsibilities. In fact, the main alteration in our law required to make it fully applicable to trust evils is that it should be compulsory on promoters to disclose all expenses and proceedings leading up to the flotation of the company.

Trusts and the State.

When all possible laws have been passed to prevent excessive prices, to protect the worker, and to safeguard the investor, so that the trust is left to rely on skill in management and on business advantages, its development will be slower but for that very reason the more sure. Under such circumstances the relations between the trusts and the State become of great importance, because we are then confronted by the alternatives of private monopoly and public monopoly. At the best private monopoly can only be a benevolent despotism; at the worst it may be a grinding tyranny, even though its slaves are well fed. It is an error to suppose that the joint-stock company system as exhibited in trusts leads to any widespread redistribution of wealth; at most the investing classes have turned their attention from gold mines and Turkish bonds to industrials. The Industrial Commission could find no evidence that wealth in the States was better distributed than before the trust period, and if in the United Kingdom we are scarcely likely to see the production of such a very wealthy group as in America, the concentration of businesses has given a very much greater power to the comparatively small class of men who own the largest blocks of stock. So long as he gets his dividends the small shareholder will never interfere with the directors except to urge them to the extraction of still greater profits. It is to be expected that wealth will make a strong effort to capture the national administration; it has ability, it has leisure, it has prestige, and it is at present in occupation. We do not need to look for the coarse and worn-out methods of bribery, but for the more subtle processes by which the "interests"—banking, shipping, railway, etc.—secure so large a proportion of parliamentary representation to-day, and for the vehement efforts which gas, tramway, water, and electric monopolies make to influence municipal elections. As in the parallel case of the liquor traffic so with the trusts, it would not be surprising if a strong public feeling should grow up that the only efficient control was public management. Additional impetus would be given to that feeling if, as some suppose, the private monopolies secure of their field ceased to trouble about improvements. A preliminary step to protect the State against the aggression of the over wealthy class would be the special taxation of the rich. That is already admitted in our taxation system, and the Industrial Commission advised the levying of a small graduated tax on the gross earnings of companies. On this it is only to be said that the special taxation of an industry or of a particular method of conducting an industry, not in itself objectionable, does not seem justifiable. The only discrimination which should be made in taxation is between earned and unearned incomes. When that principle is conceded taxation is an excellent method of taking for the State a portion of that wealth which is created by our common social activity.

The operations of foreign trusts have a special concern for the countries with which they trade. A threatened domestic industry can only be protected by itself combining against the foreigner. So much we learned from the Tobacco War. Even where a foreign

trust dumps its surplus product in a country at cost price, the home corporation could probably meet it by availing itself of the best methods of production and the economies of combination, by reducing prices temporarily as the Gas Strip Association did in 1902, or, like the Imperial Tobacco Co., by carrying the war into the enemy's country. The first duties of the State in aiding domestic industries against outsiders should be to ensure efficiency by providing a suitable education for all the industrial classes from top to bottom, and to prevent the hampering of commerce either by the railway companies or by shipping rings. If the German Government makes itself a partner with private industry by granting low freights for export over the national railways, then in the long run we shall find ourselves compelled to do with the railways what we have done with the telegraphs, and work them as a national system. If we cannot grasp the idea that commerce and industry are no longer merely individual undertakings, but predominantly national services, we shall neither understand the significance of recent changes nor the real character of the problems of the near future. So long as a nation is to exist as a nation it cannot endure servitude to a foreign trust and the disappearance of necessary industries. A protective tariff is so favorable to individual as opposed to national interests that it is naturally the first crude method of defence proposed, but rather than protect our industries against the efficient foreigner we want to force them up to his level; in the long run it is only efficiency that is dangerous. The Cunard subsidy plan, where the Government lends capital on conditions as to moderation in rates and efficiency in service, is a safer precedent, but with participation in the risks of capital should go too participation in management.

The international war of trusts may lead to two other results calling for State intervention. It may end, like the Tobacco War, in the division of territory, thus destroying the safety valve of foreign competition, or in amalgamation. In either case the possibilities of tyranny are enhanced. There is no effective defence against an international trust, except nationalization, for formal dissolution of the union would probably result only in the substitution of an equally objectionable and far less vulnerable private understanding. Public opinion turns inevitably towards the replacement of private initiative by national control, and nothing would hasten that development more rapidly than either the parcelling out of the world among the trusts or the appearance of many large international organizations.

PUBLISHED OCTOBER 1905. REPRINTED OCTOBER 1913.

MUNICIPALIZATION BY PROVINCES.

The first Report of the Committee of the Society appointed to consider the Reform of Local Government, presented to the Society on 26th May, 1905, by WM. SANDERS, L.C.C., the Chairman of the Committee, and subsequently adopted.

Industries and Local Government Areas.

WITH the growth of municipal enterprise it has become obvious that the development of the collective control of the economic life of society is largely dependent upon the capacity of the community to adapt its local government machinery to changing social and economic conditions. Much of the existing machinery in England was created for the purpose of dealing with conditions widely different from those of to-day, and for exercising powers far narrower in scope than those which are now imposed upon it by legislation, or which the community demands that it should acquire. Local authorities are given duties to perform, or are allowed to assume duties, without due consideration of their fitness for the responsibility. Thus experiments in municipal activities are entered upon under unfavorable circumstances which preclude the possibility of complete success, whereby opportunities are given to the anti-Collectivist to vaunt the superior advantages of private enterprise.

One of the first points, if not *the* first point, to be considered in connection with any further extension of the powers of municipalities, or of the collective organization of industry in any form, is that of the area over which a municipal or other local governing authority should govern. Under the old conception, or want of conception, of the duties of local government authorities this appeared to be a matter of small importance, although in connection with main roads and sewers it was sometimes borne in mind by the legislators. When a local authority was appointed to deal solely with paving, it was a matter of minor importance whether it should have authority to pave fifty yards of the Strand only, or the whole of the streets and roads of London. But when the community proceeds to provide through its own administrative machinery water, gas, electric light and power, means of communication, educational facilities, and many other services, and, moreover, must compete with private undertakings, the promoters of which are anxious and willing for a consideration to relieve the community of the burden, the question of area becomes of paramount importance.

Tramways and Light Railways.

This can be seen at once in the case of tramways and light railways. There is no existing government area which is generally suitable for the effective and profitable management of a publicly owned tramway system. Unless a town council can persuade the neighboring local authorities to agree to some arrangement under which joint action can be taken for ownership and control, a dwarfed and crippled public service is created, comparing unfavorably in reality, as well as in the public mind, with a privately owned system which, by Act of Parliament, can, within wide boundaries, run where it listeth. The town council unit as a tramway area is obviously inadequate in the crowded centres of the North; the county council area, although less open to objection, would not be wholly satisfactory. For instance, an efficient tramway service for London and the surrounding district ought to extend over country governed by the five county councils of London, Middlesex, Surrey, Essex and Kent, and many county boroughs within their boundaries. This area is served at present by disconnected, incomplete systems, partly under public and partly under private ownership. In the existing dismembered condition of the metropolitan and extra-metropolitan tramway service, it is impossible for the community to secure the full advantages of this form of transit in either convenience or economy. The big centres of population in the Midlands and the North suffer in the same way, and provide equally convincing evidence of the imperative need for the establishment for transit purposes of new authorities having control over areas, the boundaries of which might in no case be coterminous with those of existing local government areas.

Municipal Electricity and Industrial Progress.

Another service which, in order to be economically administered under public ownership, requires new authorities and areas is the provision of electric light and power. The municipal electric light and power works now in being were, in many cases, prematurely born, and, unless they can be given room to expand beyond the limits which now confine them, they are likely to become, not only horrible examples of the failure of public enterprise, but also serious obstacles to industrial advance. The metropolis offers a striking example of the failure to appreciate the importance of area in relation to the generation and supply of electricity. The metropolitan borough councils were made the authorities for this purpose, and several of them have erected generating stations and laid down their own self-contained systems. The limitations of the usefulness of their parochial installations are now obvious. For instance, the Battersea Borough Council approaches a railway company with an offer to light a huge goods station with municipal electricity. The goods station lies on the confines of the Battersea Borough Council's area, and unfortunately a small part of the station to be lighted is within the borders of a neighboring borough council which has sold to a private company its powers to supply electricity. This company

refuses to come to terms with its Battersea rival, and the railway company naturally declines to have two installations on its premises, with the result that the Battersea Borough Council loses an excellent customer and the railway company has to set up its own more expensive installation. Many other instances of this kind could be given, showing the administrative difficulties which arise through the piecemeal system of managing municipal electric light and power in the metropolis.

Area and Cost of Production.

But administrative difficulties are small matters compared with unnecessary costliness of production arising from the adoption of the view that the ancient boundaries of the authority of an ecclesiastical institution enclose an area which is convenient as a unit for the production and distribution of electric energy. A Committee of the House of Lords has now (1905) discovered the foolishness of Parliament in not recognizing that London should have had one authority for this purpose. The private syndicates that are asking power to supply the whole of the metropolis, or large portions thereof, can bring overwhelming proof from the North of England, where such syndicates produce electricity in bulk, that they could bring about a considerable saving in the cost. The London County Council ought to have been the authority for electric light and power purposes. Not only would the administrative difficulties have been far less, and the economy secured which the companies promise, but London could have been lighted in a far more efficient manner. The poorer districts, which are now often neglected in this respect, could have been better served, without extra local expense, by means of an equalized lighting rate over the whole of the metropolis, and by the equalized distribution of the surpluses accruing from the districts with a large number of private profit-giving consumers. Moreover, with the London County Council as the authority, further economy would arise from use of the generating stations to make electricity both for tramway and other purposes and for supplying light.

But even the London County Council area does not offer the most advantageous sphere. The movements and aggregations of population pay no heed to municipal landmarks, not even to those fixed for the L.C.C. London, as a unit for a well-organized, publicly owned transit service, already stretches from Uxbridge on the west to Upminster on the east, and from Potter's Bar on the north to Purley on the south; and the area of the public authority dealing with electricity should, in the main, coincide with that dealing with transit facilities. An authority controlling a province of this magnitude would have been able not only to supply the power for tramways, lighting, factories and workshops, but should have had the monopoly right to supply the tubes and the railways that are now electrifying their local lines. It is hardly necessary to point out the important step that this would have been in further co-ordinating the control of transit services.

The great centres of population throughout England present the same problems in respect of area as London. The case of the Birmingham tramway fight, in which the city was hampered and to some extent crippled as an efficient provider of means of transit by the action of surrounding minor local authorities, shows the need that the problem of local government area be dealt with on other than parochial or narrow municipal lines. The great towns of Liverpool, Manchester, Birmingham, Newcastle, Nottingham, Leeds, etc., must be considered as centres, and not as self-contained units for all local government purposes.

With regard to the supply of water new areas and authorities are urgently needed. The large towns through their greater wealth are able to annex the best water-bearing districts to the potential if not to the yet actual detriment of the smaller towns and villages.

Direct Employment and Wider Areas.

Then there is the complex question of the direct employment of labor by the local authorities in those forms of industry in which under private enterprise steady, continuous demand, with corresponding regular employment is seldom found. Here again population and area play a considerable part in determining whether municipal undertakings of this nature can be carried on so as to ensure greater permanence of employment, together with efficient and economical working. It is of course easy for a local authority, with a small population and area, to estimate with comparative certainty the number of men it will permanently require to make up its roads and keep them clean ; to clear away dust and house refuse and the like ; and therefore to employ the men and carry out the work more efficiently than a contractor, with the added advantages of affording continuous employment with a fair wage to the men engaged. But in connection with the more intricate and fluctuating work of building, which requires a well-organized works department with expensive plant and an experienced staff, a large and well-populated area is indispensable for lasting success. The metropolitan borough council area is too small for a works department which would be really effective in adding to the number of men engaged continuously in profitable employment. Nor, under present conditions, could sufficient work be found to keep the plant in use long enough to repay its first cost. A borough council may build a bath and wash-house, a library, a coroner's court, lavatories, electric power station, stables for its horses, a town hall, houses and shops for the working classes, and a disinfecting station ; but when these have been erected it has no more building to be done. It cannot do work for another public body nor for private customers. When it approached the end of its career as a useful institution there might arise a tendency to make work for the works department because it was there and because men were unemployed, regardless of consideration whether the proposed buildings were really required. The most satisfactory way of collectivizing the building trade, as far as London is concerned, would be to give the London County Council

power to undertake contracts, through its works department, for any local authority in the metropolis at cost price. This would tend to enlarge the number of workmen continuously employed in building, because arrangements could be made between the local authorities and the L.C.C. to postpone work not of an urgent nature, if the works department and the building trade generally were busy, until a slacker period arrived. Conversely, in slack times work might be pushed forward by a similar arrangement. Owing to the never-ceasing demand for schools, fire stations, asylums, and working class houses, the L.C.C. is never likely to find that its works department has become superfluous. The London County Council might, under the plan suggested, agree to take over and run as local depots and workshops any premises with plant for building already established by a borough council. For the provinces the same principle could be applied by giving a large municipality the power to carry out building work for neighboring authorities.

Housing and Existing Municipal Boundaries.

In the administration of the Housing Acts it is often found that the existing municipal areas are far from satisfactory. Even London, in spite of the considerable amount of land still unbuilt upon in its southern portion, is now compelled to go over the border in order to find space at a reasonable price for its working class estates. Now, it is obvious that the creation of purely working class communities is an altogether unsatisfactory way of dealing with the problem of housing. The policy of the London County Council has, however, been adopted mainly through the pressure of circumstances over which it had no control. It has had no voice in determining the development of the city itself, nor of the outer ring which is as much London for administrative purposes as is the precinct of the Savoy. If the Council had possessed the power wielded by some German municipalities, it might not only have directed the growth of London as we know it, but have automatically extended the metropolis, as the suburbs, such as Tottenham, Croydon, and East Ham, came into existence; and at the same time have modified the intensity of the concentration of the poor into districts such as South West Ham, by decreeing what use should be made of the land when it became ripe for building purposes. As things are, when the London County Council goes outside its boundary to provide accommodation for the working classes, it is met by the active and passive resistance of the local authority. The Croydon Town Council naturally objects to the erection of a working class estate at Norbury, and its objection takes the form of declining to pass the plans for the houses unless the said plans conform to building regulations which, although no doubt eminently reasonable, are quite at variance with those approved by the L.C.C. Building Act Committee. The dispute which then takes place between London and Croydon causes delay, expenses of modifying plans, and a considerable amount of wasteful friction and irritation. The capital charges of the housing scheme accumulate without any return in revenue, and a promising experiment in

municipal brick-making on the sites of the scheme is almost ruined. Again, an outside suburban authority may adopt a standard of assessment or rating on a housing scheme which completely upsets the calculations as to rent made by the authority providing the houses, in order to discourage the building of working class houses by another local body. The L.C.C. has also had experience of this form of difficulty. The Council has projected a large housing estate in the area of the Tottenham Urban District Council. At first blush it would be thought that this scheme would be welcomed by Tottenham because it would lead to an increase of the rateable value of the district. But Tottenham has good reason for not rejoicing at this growth of bricks and mortar promoted from outside. The houses are to be small, and will be occupied by the working classes. Now, the working classes have large families, as a rule, and the children require education. Tottenham Urban District Council is the local education authority, levying a rate for educational purposes nearly as high as that of East Ham, and the Council is under the impression, and the impression is probably a correct one, that the addition to the ordinary rateable value, which the London County Council housing scheme would bring, would be more than counterbalanced by the charge upon the rates for educational and other purposes. The Tottenham District Council, evidently to get even, declined to allow the London County Council to compound the rates, which is the usual custom in connection with small houses, and also assessed the houses already built at a higher figure than was warranted by the rent fixed by the L.C.C. The L.C.C. was compelled to fix a rent less rates, the latter being paid by the tenant direct to the Tottenham authority, a system which, it is hardly necessary to state, does not add to the popularity among the working classes of municipally owned houses—especially when the assessment is higher than the rent justifies—no matter how comfortable or otherwise satisfactory the dwellings may be. The L.C.C. is still* at loggerheads with Tottenham District Council on this matter, and the development of the estate is delayed and becoming more expensive through this inter-local, unfriendly act on the part of the latter. These instances in connection with municipal housing have been given at length, because it had been thought that if a housing authority were given power to go outside its borders to erect dwellings for its working class citizens, a great step would be gained in the solution of the housing problem. It is, however, evident that if a municipality is given the power to create its suburbs, it should receive the local control of them; and, moreover, the control should be given before the suburb has reached an advanced stage of self-consciousness. The extension of local government areas for housing purposes does not, however, entail the creation of new authorities. This form of *extension* differs from the kind which is necessary for the administration of such public services as transit, electricity and water.

The New Heptarchy.

Taking these three services—or rather two, reckoning transit and electricity as one—it will be necessary, in endeavoring to devise new authorities and new areas for their administration, to drop the idea that they should remain municipal services in the narrowest sense of the term municipal. They should not become even county, but provincial services. It may be that in connection with the water supply, or with the supply of electricity, it will be found that the best administrative areas will be created by following the Hegelian historical spiral until we arrive at a stage with regard to the division of the country vertically above the period of the Saxon Heptarchy, and make a halt there. But whether seven or more provincial water boards, and seven or more transit and electricity boards are formed is immaterial, provided the provincial principle is applied to those areas where narrow municipal boundaries are cramping the growth of the collective control of industry.

Voluntary Federation of Local Authorities.

It has been suggested that the new areas and authorities could be called into existence by a system of municipal federation without compulsory legislation. For instance, a large city, say Birmingham, might arrange with neighboring authorities to form a joint committee to run a transit and electricity scheme, or a water supply. This has already been done in one or two cases in connection with the latter service. This method, it is urged, would safeguard local autonomy and disarm the antagonism of municipalities to all proposals which aim at relieving them of any of their duties. These, however, are the strongest arguments that can be brought in favor of leaving local authorities to decide whether for certain purposes they should or should not be linked up. The chief defect of such a system is that it is only likely to be adopted in very few cases. A joint committee of the voluntary kind would be formed only in those instances where all the districts represented on the committee would be equally benefited by co-operation. Where a thickly populated city stood to lose for a time by combining with its thinly populated suburbs in a transit and electricity scheme, or a water supply, the city council would naturally decline to federate with the suburban local authorities. Again, local jealousy would come into play, especially in relation to profits, and this would be a barrier to joint action. It is hopeless to expect an effective linking up of areas except by legislation, which will not make allowance for purely parochial considerations.

A National Survey.

(a) TO DEFINE BOUNDARIES OF ENLARGED MUNICIPALITIES.

In order to bring the New Heptarchy into existence it will be necessary to create by legislation the preliminary power of creation. Even the business of widening the boundaries of a municipality can only be done at present by an Act of Parliament for each case. A

bill for this purpose may be thrown out for some petty local reason, over-riding for the moment the real interests of a divided community, which for municipal purposes ought to be a unit. Liverpool and Bootle, Manchester and Salford, Birmingham and the surrounding borough and urban district councils—not to speak of London, with its belt of corporations and district councils, which ought never to have been called into being as entirely separate and independent bodies—all bear witness to the want of guiding principles in English local government, especially in relation to area.

To bring about speedily a reform in this connection on national instead of on piecemeal lines, a commission should be appointed by Parliament to make a survey of, and an inquiry into, the working of the whole of England's municipal and local government institutions and machinery. A precedent for the establishment of such a body will be found in the Royal Commission which was appointed in 1833 to inquire into municipal institutions, and on whose report the Municipal Corporations Act of 1835 was based. The proposed commission would have to keep two main objects in view. First, to ascertain what municipal areas required enlarging in the interests of good government. We can imagine this commission, supposing it be not composed of men imbued with a craven fear of great municipalities, reporting in favor of the inclusion within the county boundary of London of the municipal boroughs of Hornsey, West Ham, East Ham, Bromley, Croydon and Wimbledon; the urban districts of Chiswick, Acton, Willesden, Hendon, Finchley, Tottenham, Walthamstow, Leyton, Barking, Erith, Bexley, Foots Cray, Chislehurst, Beckenham, Penge, The Maldens and Coombe, Ham and Barnes; and the rural districts of Croydon and Bromley. These local government areas touch the boundary of the existing County of London, but they do not exhaust the list of districts which could with advantage be included in a new County of London. It would also advise the extension of the powers of the municipalities of Manchester and other great cities over much larger areas than they now govern. Even cities like Norwich, and small towns of the type of Guildford, which do not at this moment display any startling signs of expansion, should be given room to stretch, for it is impossible to forecast the future of any aggregation of population. The rise of a new industry, or an improvement in the means of communication, may bring about an increase of population with surprising swiftness, which would cause the town to flow over its original confines, and lead to the springing up of independent suburbs that later might become obstacles to the welfare of the town, and ultimately, as in the case of East Ham, find the financial burdens of municipal independence more than they could, or ought to, bear.

In fusing areas there would be a large amount of work in the adjustment of rates, of the payment of interest on capital or debt borrowed for local purposes, and in settling other financial questions; but as this adjustment has been carried out with comparative ease in the complicated situation which arose from the merging of

several vestries into one metropolitan borough under the London Government Act of 1899, as well as in numerous instances of municipal extensions, this work would not prove a serious difficulty. With regard to the areas absorbed, where they were of considerable extent, as, for instance, the extra-metropolitan districts already referred to, they would retain a part of their identity and separate powers. West Ham, East Ham, and the rest would become metropolitan borough councils, and their electors would send representatives to the London County Council. In the cases of Manchester, Liverpool, and other provincial cities, the areas taken in by them could be dealt with in one of two ways. If they were small additions to the city, their separate powers would be abolished and they would become wards of the city. But if it were found necessary to bring in a number of fairly large areas, it might be advisable to adopt the system now peculiar to London, that is, to create a Manchester County Council, and a number of borough councils subordinate to it with powers over narrowly local matters, such as libraries, street sweeping, local drains, etc. This scheme would naturally involve the application of the principle of equalization of rates to the whole of the new county council area. It may be mentioned that the Prussian Government is considering the adoption of the London County Council and borough council system in the creation of a larger capital out of Berlin and the surrounding townships.

(b) TO CREATE AND DEFINE AREAS OF NEW PROVINCIAL
BOARDS.

The other and more important object of the survey and enquiry would be to map out England into suitable areas for the administration of what we have entitled provincial services. Obviously this would be a task of great magnitude, and would require the assistance of a corps of experts. In deciding upon the areas for the provincial transit and electricity boards the commission would have to take into consideration the existing tramway and light railway systems and supplies of electrical energy, and the opportunities for future development; likewise the possibilities of the inauguration of motor car services both for passenger and goods traffic; for the transit and electricity boards would have to be given power to institute other means of transit besides those associated with flanged wheels and rails. The centre of each area should be a great city such as London, Birmingham, Manchester, Liverpool or Newcastle. In the case of the water boards consideration would have to be given to the sources of supply, the natural catchment areas, watersheds, the distribution of population and the estimated rate of its increase. It is probable that the area under the control of a water board would have to be made extremely large. Assuming that the commission held that the water board having London for its centre should be restricted in its right to take water from the Thames, and be compelled finally to go to Wales for its supply, it might be found necessary to make a province for water purposes extending from the hills of South Wales to the eastern limit of London all placed under the control of one

board. One strong reason for this would be to ensure that the satisfaction of the existing and probable water needs of the towns and villages between the metropolis and the source of supply were provided for; another reason would be the securing to the towns, and especially the villages, along the lines of the aqueduct or water mains, of service on the same terms as London, so that they would not be compelled to pay a profit as a customer to an outside authority.

The commission would not be required to bring every part of England under the control of either of the two kinds of boards. At the same time the areas mapped out would not be final, but it would be understood that they could be extended or contracted according to the necessity for rearrangement arising from the drifting of population, or from the amalgamation of existing water, transit or electricity services. The aim should be to make the areas as elastic and the administrative machinery as flexible as possible.

Constitution of the Provincial Boards.

In forming the new boards it would not be necessary to disturb existing local governing bodies in any way. The members of the boards must be elected by the various local authorities within the area under its control. This process of formation would be a linking-up of areas and not the creation of new ones. It would be simplicity itself. For instance, assuming that the commission took the common-sense view already expressed that the transit and electricity board area for London and district should embrace not only the county of London but the greater portion of Essex, Middlesex, Surrey and Kent. In that case the transit and electricity board would be elected by the county councils of the five counties, with the addition perhaps of representatives from urban sanitary authorities within the area. This system of linking up would enable part of one county to be within the area of one board and part within another, as would most likely be necessary in the North, especially in the case of Yorkshire and Lancashire. The proportion of representatives allotted to each county council and urban sanitary authority would be based either upon population or rateable value. It might be found desirable for the boards to co-opt a certain number of experts, and power to do this should be given them.

To the transit and electricity board thus elected would be transferred all the property in transit facilities owned publicly within its area, together with all liabilities attached thereto. It would also be given the powers, possessed by its constituent bodies, of laying down new tramway and light railway systems, and of acquiring those under private control, together with fresh powers of the kind already mentioned for running motor services and the like. Financial adjustments would have to be made, as in the case of the extension of municipal boundaries. These would chiefly relate to the allocation of profits, a matter which will be touched upon presently. The constitution of the water boards would be similar to that of the transit boards.

New Powers for the Local Government Board.

The report of the commission framed on these lines should form the basis of a bill giving power to the Local Government Board to carry into effect the recommendations set forth. A bill of this kind would naturally arouse great opposition on the grounds that it conferred too much power upon a State department, and that it violated the independent rights of the municipalities. But it is obvious that no House of Commons could give sufficient time to deal with the whole of the enormous mass of detail involved in the proposals we are discussing; nor would it be a proper tribunal even if the necessary time were available. The feelings of the great municipalities might be appeased if they could be brought to appreciate the fact that the bill, in the clause dealing with the extension of municipal boundaries, would most likely give them compensation in the shape of larger territory for the loss of complete autonomy over their transit, water and electricity enterprises. Be that as it may, no method of creating the new areas and authorities in a satisfactory manner on national lines appears to be possible, except that of asking Parliament to settle principles and leaving to the Local Government Board the details of this revolutionary reconstruction of our local government.

Assuming the bill embodying our suggestions to have become law, the Local Government Board would have to create a special department for the purpose of putting the Act into operation and of supervising its working. Whenever it appeared to the Local Government Board that an extension of the area under the control of one of the new boards required modification, it should have power to issue an Order equivalent to the Act of Parliament now necessary to secure the enlargement of a municipality. Such an order would be issued when it was found desirable to extend the area of a transit and electricity or other board, or to transfer a portion of the area of one board to another. The Local Government Board should not be expected to wait until it was approached by a locality before it took action, but should be constantly endeavoring to make municipal boundaries and the areas of the boards correspond to the maximum of efficiency in administration. It is interesting at this point to note that the Unemployed Workmen Act, 1905, gives power to the Local Government Board "for facilitating the co-operation of any body or committee having powers under this Act for any area with any other body or committee, or with any local authority, and the provision of assistance by one such body or committee to another." (Sec. 4, 1, i.) This is a faint foreshadowing of the idea of the power the Local Government Board ought to possess in relation with the whole of local government.

Financial Arrangements.

As the two new boards which have been dealt with will be engaged in forms of public business which are likely to yield a surplus of revenue over expenditure, the question of the disposal of

the profits will have to be considered. One of the chief difficulties in the way of the transference of the tramway system from the control of the existing tramway authority, such as the London County Council or the Manchester City Council, to that of a provincial Transit and Electricity Board will be a financial one. Most of the large tramway authorities are able to relieve the rates to some extent from the surplus accruing from their lines. It may be necessary to guarantee for a period at least that this subsidy to the ratepayer shall not be lost through the merging of a municipal trading concern into a provincial undertaking. The ultimate aim, however, of the administrators of the new boards should be to make little or no profit. It is, of course, impossible to run a large business so that the revenue shall just square with the proper expenditure. In order to insure against loss it is necessary to make a surplus. This should be used whenever possible to improve and extend the undertaking which has earned it rather than to relieve the ordinary rates. The adoption of the principle of subsidising the rates out of overcharges on public services leads to a false standard of judgment as to the success or failure of those services. Should a Transit and Electricity Board fail at any time to keep its expenditure within its income, and be compelled to come upon the rates to make up the deficiency, the rate to meet it should be levied equally over the whole of the area under the control of the board. Water Boards, however, need never fall back on such assistance, as their charges can always be regulated to cover their outgoings.

From Province to Nation.

The establishment of a system of provincial boards as here indicated does not exhaust the possibilities of co-ordination of area in connection with local government and the collective control of industry. In course of time it will be found possible to carry the development a stage further, and from the Provincial Boards to elect National Boards, which would stand in the same relation to the Provinces as the Co-operative Wholesale Society does to the various societies which are its component parts. For instance, a National Board elected from the provincial Transit and Electricity Boards might be empowered to carry on the work of building rolling stock by direct employment in its own workshops for the whole of the publicly owned transit services of the country. It might also start factories for the manufacture of tramway rails and motor cars. It could undertake the work of constructing plant of all kinds for publicly owned electric light and power installations. Various local authorities build their own vans, carts, and waggons, and there is no reason why trams could not be built in a public workshop with equal ease. A similar National Board composed of representatives from the Water Boards might manage the manufacture of water pipes and pumping machinery, and run an engineering department for the construction of reservoirs, pumping stations, filtering beds, and so forth. Given space and elasticity, the Provincial Boards might evolve numerous activities, just as the railway companies

have grown from being simply the providers of an iron road into engine and other rolling stock builders and owners, hotel keepers, bakers and confectioners, printers, electric apparatus makers, and the direct employers in many trades which would seem at first to have no relation whatever with carrying persons and goods from one place to another. Every development of this kind on the part of a private undertaking means the strengthening of its hold upon industry. On the other hand, similar developments on the part of public authority lead to the extension of the power of society over its own economic life.

Method of Election.

The increased responsibility and work which will be thrown upon local government by the creation of the new boards bring up the question of the type of representative and official required for successful administration, and how they are to be harnessed to the public service. The discussion of this highly important matter does not fall within the scope of this pamphlet, but it will be dealt with in another upon the whole question of the reform of the local government official service.* Suffice it to say that the idea of direct election to *ad hoc* authorities (which the new boards would be) as the best way to secure the best representatives for that authority, is no longer held by those who appreciate the complexities of modern local government. Direct election for the new boards would mean the multiplication of electoral contests in which the public already display too little interest. Provided that the citizens of the enlarged municipalities and of the county councils and other authorities responsible for the selection and election of the members of the boards took sufficient interest in municipal affairs to elect efficient persons in the first instance, indirect election would not fail to give satisfactory results.

Flexibility and Expansiveness in Administration.

The reforms and changes here sketched out, revolutionary though they may appear, will probably receive attention sooner than may be expected. The unjust incidence of some forms of local taxation—arising from the segregation of the community into cities of the well-to-do and warrens of the poor—is sure to bring the subject of the extension of municipal boundaries to the front. The discussion of this question is bound to lead to the consideration of other aspects of the working of local government machinery. If the community is wise enough, when that time comes, to insist that its organized life should be made as flexible and expansive as that of private enterprise, then the rate of speed in the direction of collective control of industry will be increased. If it remains tied to rigid and cramping forms of social organization, experiments in collectivism are liable to be incomplete and the results unconvincing to the average citizen, who will always be prone to overlook the difficulties which

* No. 2 of the New Heptarchy Series.

hamper the work of local authorities and to magnify the small mistakes they may commit. The first necessity of a publicly controlled industry or service is that of every infant, namely room to grow. The needed space can be given by the adoption of the Heptarchic idea of local government in place of that which is associated with the parish pump.

PUBLISHED MARCH 1907. SECOND REPRINT OCTOBER 1913.

THE DECLINE IN THE BIRTH-RATE.

ON the 26th of May, 1905, a sub-committee of the Fabian Society was appointed with a curt reference—"to consider birth-rate and infantile mortality statistics"—with a view to investigate certain social phenomena of importance. The investigations of the sub-committee were directed first to the decline in the birth-rate; and as they led to conclusions of interest and importance, an informal interim report was, by direction of the Executive Committee, drawn up by one of its members—the facts and suggestions being put by the author in his own way, upon his sole responsibility—and communicated by him to the *Times*,* whence it was reprinted by the [American] *Popular Science Monthly*. The sub-committee is continuing its labors, but, for the convenience of members and others, the substance of the informal interim report is now reproduced in more accessible form, without the Fabian Society as a whole being committed to its suggestions.

The phenomenon to be investigated was the decline in the number and proportion to population of the children born in Great Britain. Such a decline had long been an object of desire in certain quarters. "If only the devastating torrent of children could be arrested for a few years," wrote one of the most sympathetic friends of progress, not so very long ago, voicing the opinion of the economists from Malthus to Fawcett, "it would bring untold relief."† Not many years have passed, and his aspiration is fulfilled. One of His Majesty's Inspectors of Schools, lately revisiting, after some interval, a public elementary school in the centre of London, remarked that, since he was there before, without any alteration in the school regulations, the "babies' class" had ceased to exist. Between 1896 and 1905 the total population of the County of London is estimated to have increased by 300,000 persons. But the total number of children between three and five years of age who were scheduled by the vigilant school-attendance officers positively fell from 179,426 to 174,359. That this scheduling was fairly exhaustive is shown by the fact that

* The report appeared in the *Times* of the 11th and 18th October, 1906; and in the *Popular Science Monthly* for December, 1906. Besides many articles and notices in the principal newspapers during October, 1906, it elicited articles, in confirmation or controversy, in the *Fortnightly Review* (by Montague Crackenthorpe, K.C.) and *Nineteenth Century* (by J. W. Barclay) for December, 1906.

† *The Service of Man*, by J. Cotter Morison, preface, p. xx.

there were almost exactly 5,000 fewer children of that age recorded in the London census of 1901 compared with that of 1891. Nor is this either an isolated or a temporary phenomenon. All over England and Wales the birth-rate is falling steadily, in a decline which has already lasted thirty years, and which shows no sign of slackening. In 1876, to every 100,000 of the population there were born 3,630 babies. In 1904, to every 100,000 of the population there were born only 2,790—absolutely the lowest number on record since birth registration began.*

1. *This decline in the birth-rate is not merely the result of an alteration in the ages of the population, or in the number or proportion of married women, or in the ages of these.*

It is necessary at the outset to remove one possible explanation. What the Registrar-General gives us is the crude birth-rate—that is to say, the exact proportion of births during the year to the total population, whether old or young, married or single. But in comparing these birth-rates for different years, we have to remember that important changes may take place, even in a single decade, in (a) the proportion between children and adults; (b) the proportion between married and unmarried; and (c) the proportion between married women of the reproductive age and those above that age. These changes—due, it may be, to emigration or immigration, to economic or social developments, or to mere prolongation of the average life—are sufficient, in themselves, to produce a rise or a fall in the crude birth-rate, without there having been any increase or decrease in human fertility. To give one striking instance, the crude birth-rate of Ireland per 100,000 population fell from 2,384 in 1881 to 2,348 in 1901. But we happen to know that in the course of these twenty years the proportion of married women of reproductive age to the total population so far diminished that the slight fall in the crude birth-rate really represented, not a decline, but a positive increase in fertility. If the Ireland of 1901 had contained a population made up by ages, sexes and marital conditions, in the same proportion as that of 1881, the recorded births in 1901 would have appeared as a birth-rate actually higher by three per cent. than that of 1881. We have, therefore, first to ask what are the corresponding figures for England and Wales, eliminating all the elements of variations of age, of postponement of marriage, and of positive refusal to marry.†

Now, it so happens that this problem has lately been worked out by the statisticians in a way to remove all uncertainty. Dr. Arthur Newsholme and Dr. T. H. C. Stevenson on the one hand, and Mr. G. Udny Yule on the other, have performed the laborious task of “correcting” the crude birth-rates for differences of age, sex and

* Sixty-seventh Annual Report of the Registrar-General, 1906, p. xix.

† I have restricted myself throughout to legitimate births. The number of illegitimate births in England and Wales is now only 112 per 10,000 of the population, and their omission does not affect the result. Their inclusion would merely have intensified the force of the argument at all points. The corrected illegitimate birth-rate fell between 1861 and 1881 by 21 per cent., and between 1881 and 1901 by 41 per cent.—more than twice as fast as the correct legitimate birth-rate.

marital conditions, as regards the census years from 1861 to 1901.* The results show a definite progressive fall since the 1871 census in the proportion of births, after allowing for all differences in the way the populations are made up. If the people of England and Wales had continued during those fifty years to be exactly of the same ages, and to be exactly in the same proportion married and single, the births per 100,000 of the population would have changed to the following extent: 1861, 3,236; 1871, 3,312; 1881, 3,273; 1891, 3,125; 1901, 2,729. That is to say, if the fertility of the married women of equivalent ages had remained the same in 1901 as it had been in 1871, there would have been born 3,312 babies per 100,000 population, instead of 2,729, or just upon 21 per cent. more, equal in the whole of England and Wales to something like 200,000 more than actually saw the light. Why were those 200,000 babies not born?

2. *The decline in the birth-rate is not confined to the towns, nor (so far as England and Wales is concerned, at least) is it appreciably, if any, greater in the towns than it is in the rural districts.*

Human fertility may possibly be normally slightly lower in the towns than in the rural districts, and it is sometimes suggested, especially by German authorities, that the fall in the birth-rate is to be accounted for by progressive "urbanization." But English statistics afford no support to this hypothesis. It is true that the corrected birth-rates of the towns of Northampton, Halifax, Burnley and Blackburn fell off between 1881 and 1901 by no less than 32 per cent., and that of London by 16 per cent. But the corrected birth-rate of Cornwall fell off by 29 per cent., that of Rutland by 28 per cent., those of Sussex and Devonshire by 26 per cent., and that of Westmoreland by 23 per cent. It is no less significant that, whilst the corrected birth-rate of all Ireland actually rose during these twenty years by three per cent., that of Dublin rose by nine per cent. If it was the unhealthy environment of our great towns that was causing a reduction in the number of births, we might expect to find Liverpool, Salford, Manchester and Glasgow—cities of extensive overcrowding, fearful slums and high mortality—heading the list. As a matter of fact, the corrected birth-rate between 1881 and 1901 fell off proportionately less in these cities than in any other town, and actually less in proportion than in all but six of the counties. A decline in the birth-rate, which does not appear at all in Dublin, appears much less in Liverpool and Manchester, Salford and Glasgow than in Brighton, and appears far more in Westmoreland, Rutland, Devonshire and Cornwall than in any of those towns, can hardly be due to "urbanization."

* "The decline of human fertility in the United Kingdom and other countries as shown by corrected birth-rates," by Arthur Newsholme, M.D., Medical Officer of Health, Brighton, and T. H. C. Stevenson, M.D., Assistant Medical Officer to the Education Committee of the London County Council; "On the changes in the marriage and birth-rates in England and Wales during the past half century; with an inquiry as to their probable causes," by G. Udny Yule, Newmarch Lecturer in Statistics, University College, London. Both these papers will be found in the *Journal of the Royal Statistical Society*, March, 1906.

3. *The decline in the birth-rate is exceptionally marked where the inconvenience of having children is specially felt.*

There is not much evidence to be adduced under this head, but what there is is of some significance. It is an error to suppose that the decline is entirely, or even principally, among the wealthy or the middle class. Where married women habitually go to work in factories, and where their earnings form an important element in the weekly income of the family, the interruption caused by maternity is probably most acutely felt. The enforcement by the Factory and Workshops Acts of 1891 and 1901 of four weeks' absence from employment after child-birth comes as an additional objection. Moreover, in the factory districts the later age at which children can now become productive wage-earners has certainly rendered large families less economically desirable than of yore. It is, therefore, of some significance that the ten towns in all England in which the relative fall in the birth-rate between 1881 and 1901 is most startlingly great are Northampton, Halifax, Burnley, Blackburn, Derby, Leicester, Bradford, Oldham, Huddersfield and Bolton—all towns in which an exceptionally large proportion of married women are engaged in factory work, in textiles, hosiery or boots. I can adduce no statistics of the decline in the birth-rate among the married women teaching in schools; but it is known to be great.

4. *The decline in the birth-rate appears to be marked also in places inhabited by the servant-keeping class.*

It is significant that Brighton shows a relatively heavy falling off from a birth-rate which was already a low one. But a comparison between various districts of London gives us further indications. Let us take, as a convenient index of relative wealth, the percentage of domestic servants to population. The corrected birth-rate of Bethnal Green—the district of London in which there are fewest non-Londoners and in which fewest of the inhabitants keep domestic servants—fell off, between 1881 and 1901, by 12 per cent. (or exactly as much as that of the North Riding of Yorkshire). But that of Hampstead—where most domestic servants are kept—fell off by no less than 36 per cent., and attained the distinction of reaching the lowest of all the corrected birth-rates that Dr. Newsholme has computed. Second only to Hampstead in this respect come Kensington and Paddington, which have statistically to be taken together, and which, keeping nearly as high a proportion of domestic servants as Hampstead, saw their corrected birth-rates, already lower than that of Hampstead, fall off by 19 per cent., and sink to less than two-thirds of that of the Bethnal Green of 1881. It would be interesting to extend this comparison, taking all the districts of London in the order of their average poverty, as shown by such indices as the proportion of the inhabitants who live in one or two-room tenements, by the rateable value per head, and by the percentage keeping domestic servants. But the variations in the registration areas in nearly all these cases prevent accurate comparison of birth-rates between 1881 and 1901. Dr. Newsholme and Dr. Stevenson, on the

one hand, and Mr. Udny Yule, on the other, do, indeed, compare the corrected birth-rates for 1901 of five separate groups of metropolitan boroughs, arranged in grades of average poverty. This comparison gives us the interesting result that the small group of three "rich" boroughs has, per 100,000 population (corrected) 2,004 legitimate births; the four groups comprising nineteen intermediate boroughs have almost identical legitimate birth-rates of between 2,362 to 2,490 per 100,000; whilst the poorest group of seven boroughs has a legitimate birth-rate of no less than 3,078, or 50 per cent. more than that in the "rich" quarters. From these figures it has been inferred that we are, in London at any rate, multiplying most prolifically from our least wealthy stocks. It should, however, be noticed that the group of seven "poor" boroughs happens to include, not only those containing the greatest numbers of Irish Roman Catholics, but also those in which the great bulk of the Jews are to be found. Practically half the marriages that take place in the registration districts of Whitechapel and Mile End Old Town are solemnized according to the Jewish rite. It is against all the influences of the Jewish religion, tradition and custom to limit the family, and the birth-rate among Jews of all classes and all nationalities is known to be large. We cannot, therefore, infer from these statistics either that the birth-rate of the poorest stratum of the English race in London is greater than that of the artizan or lower middle class. The remarkable evenness of the corrected birth-rate throughout the nineteen "intermediate" metropolitan boroughs, though they vary from having about 15 up to about 45 per cent. of servant-keeping households, is rather an indication to the contrary. This is in accordance with the fact that the decline in the corrected birth-rate appears to be as great in the counties made up preponderatingly of the poorly paid agricultural laborers, as in those districts in which the average level of wages is much higher.*

5. *The decline in the birth-rate appears to be much greater in those sections of the population which give proofs of thrift and foresight than among the population at large.*

Here we have to leave the carefully corrected birth-rates supplied by Dr. Newsholme, and fall back upon evidence which is statistically less perfect. What would be desirable would be to have precise and "corrected" birth-rates for different years of two sections of the population, the one comprising those who took thought for the morrow and the other comprising those who did not. Such an exact contrast is, of course, unattainable. But it so happens that we do possess, over a term of nearly forty years, the number of children born in one large sample of the population, selected, it might almost be said, solely by the characteristic of thrift. The Hearts of Oak

* The failure to take into account the special aggregation of the Jewish and the Irish population in the districts of greatest poverty, and the limitation of the investigation to London, appear to me to diminish the validity of some of Mr. David Heron's implications in the recent publication, *On the Relation of Fertility in Man to Social Status, and on the changes in this relation that have taken place during the last fifty years.* 1906. But his calculations point in the same direction as those cited.

Friendly Society, the largest centralized benefit society in the kingdom, has now over 272,000 adult male members. This membership belongs to all parts of the United Kingdom, of which it may be said to represent about three per cent., or no inconsiderable sample. No one is admitted who is not of good character and in receipt of wages at least 24s. per week, a figure which excludes the agricultural laborer, the unskilled worker in town or country, and even (outside London) the lowest grades of skilled artisans. The society consists, in fact, of the artisan and skilled mechanic class, with some intermixture of the small shopkeeper and others who have risen into the lower middle class. Among its provisions is the "lying-in benefit," a payment of 30s. for each confinement of a member's wife. Unfortunately, we do not know either the relative proportions of the members who are married or the average age of the wives. There is, however, no reason to think that the proportion of married members has appreciably changed, whilst it is believed that the average age of the members as a whole has risen from about 33 to 37·52; and it may possibly be inferred that there is a corresponding increase in the average age of the wives. Judging from the evidence of the Scottish census of 1855,* we might in such an event have expected a falling off in the births, due to this assumed difference of age, of at most 15 per cent. Now, what are the facts? From 1866 to 1880 the proportion of lying-in claims to membership rose slowly from 2,176 to 2,472 per 10,000. From 1881 to 1904 it continuously declined, until in the latter year it reached only 1,165 per 10,000 members. The birth-rate among the population of a million and a quarter persons, distinguished from the rest, so far as is known, only by one common characteristic, that of thrift, has fallen off between 1881 and 1901 by no less than 46 per cent., or a decline nearly three times as great as that during the same period in England and Wales. Taking the whole period of decline, from 1880 down to the latest year for which I have the statistics, 1904, the falling off is over 52 per cent. A smaller society, the Royal Standard Benefit Society, having 8,225 members and giving a similar benefit, shows similar results. Between 1881 and 1901 the proportion of members claiming the lying-in benefit fell off by more than 56 per cent. If the members of the Hearts of Oak Friendly Society and the Royal Standard Benefit Society had had proportionately as many births in 1904 as the members of 1880 had in that year, there would have been born to them nearly 70,000 babies, instead of 32,000. If the birth-rate in these 280,000 families of comparatively prosperous artisans had only fallen in the same degree as that of England and Wales generally, there would have been born to them 58,000 babies instead of 32,000. What was the special influence in these exceptionally thrifty families that prevented the other babies being born? It looks as if the birth-rate was falling most conspicuously, if not exclusively, not among the wealthy or the middle class, as such, but among those sections of

* See the figures given in *Fertility, Fecundity and Sterility*, by J. Matthews Duncan, 1871; and those in *Natality and Fecundity*, by C. J. and J. N. Lewis, 1906, pp. 18, 26 and 33.

every class in which there is most prudence, foresight and self-control.

6. *The decline in the birth-rate is due to some new cause which was not appreciably operative fifty years ago.*

We may, indeed, infer, from the relatively stationary birth-rate, alike of the whole population and of selected classes down to some date between 1871 and 1881, and the steady persistence of the subsequent decline, that the decline is due to some new cause. The same conclusion is reached by the elaborate calculations just published by Mr. Heron.* In 1851, as in 1901, it could have been inferred from a comparison of different districts in the metropolis that "the more cultured, the more prosperous, healthy and thrifty classes of the community" were producing fewer children per marriage than the classes of lower social status. But, as regards London in 1851, Mr. Heron is "driven to almost certain conclusion that differences in the mean age of wives were amply sufficient . . . to account for the differential birth-rates of districts with divergent social status." The operating cause of a low birth-rate was, in fact, at that date, postponement of marriage, operating chiefly among the rich, professional or "middle" classes. We know, however, from Dr. News-holme's corrected birth-rates that no such cause as a greater postponement of marriage, with the corresponding rise in the age of the average wife, has anything to do with the decline in the birth-rate now recorded. This decline is due to something affecting all classes other than causes that were appreciably in operation in 1851.

7. *The decline in the birth-rate is principally, if not entirely, the result of deliberate volition in the regulation of the marriage state.*

The reader can scarcely have read the foregoing statements without coming to the conclusion that the falling off in the birth-rate, which has during the last twenty years deprived England and Wales of some 200,000 babies a year, is the result of deliberate intention on the part of the parents. The persistence and universality of the fall in town and country alike; the total absence of any discoverable relation to unhealthy conditions, mental development, the strain of education, town life or physical deterioration of any kind; the remarkable fact that it has been greatest where it is known to be widely desired; the evidence that it accompanies not extreme poverty but a variety of conditions (among which social well-being is only one) leading to a positive wish not to have a large family; and that it is exceptionally marked where there is foresight and thrift—all this points in one and the same direction.†

* *On the Relation of Fertility in Man to Social Status, and on the changes in this relation that have taken place during the last fifty years*, by David Heron, 1906, p. 20.

† It is, at any rate, consistent with the hypothesis of volitional interference, in view of the fact that illegitimate children are, on an average, certainly less desired than legitimate, that, as already stated, the corrected illegitimate birth-rate should have fallen off in England and Wales more than twice as much as the legitimate, and twice as much between 1881 and 1901 as between 1861 and 1881. The figures for Scotland correspond to these. (*Natality and Fecundity*, by C. J. and J. N. Lewis, 1906, p. 54.)

We may add other evidence. Among the Roman Catholics in the United Kingdom any regulation of the marriage state is strongly forbidden, and has, during recent years, been made the subject of frequent, special animadversion, both privately and from the pulpit. It is significant that Ireland is the only part of the United Kingdom in which the birth-rate has not declined; that in Ireland itself it has declined a little in semi-Protestant Belfast, and not at all in Roman Catholic Dublin; and that in the towns of Great Britain the decline is least in Liverpool, Salford, Manchester and Glasgow—towns in which the proportion of Roman Catholics is considerable. Among the principal textile factory towns the decline is least at Preston, which is the one having the largest proportion of Roman Catholics. Among the different metropolitan boroughs—though we can not measure with accuracy the fall in the birth-rate—the present rate is highest, and, therefore, in all probability, the fall has been least, in those boroughs in which the Irish Roman Catholics (and the Jews who, in this respect, are in the same position) are most numerous. All this is inconsistent with the hypothesis that the decline is due to physical degeneracy, and consistent with that of its being due to deliberate volition. Common report that such deliberate regulation of the marriage state, either with the object of limitation of the family, or (which has the same result) with that of regulating the interval between births, has become widely prevalent during the past quarter of a century—exactly the period of the decline—reaches us from all sides—from doctors and chemists, from the officers of friendly societies and philanthropists working among the poor, and, most significant of all, from those who are engaged in the very extensive business to which this new social practice has given rise. What is needed to complete the demonstration is direct individual evidence that volitional regulation exists. This the sub-committee of the Fabian Society set itself to obtain.

The procedure adopted was to obtain a voluntary census from a sufficiently large number of married people who could be relied upon to give frank and truthful answers to a detailed interrogatory. For this information resort was had to between 600 and 700 persons, from whom the committee had grounds of hope that answers would be received. About half of these persons resided in the metropolitan area, the remainder being scattered sparsely over the rest of Great Britain. In social grade, they included a most varied selection of occupations, extending from the skilled artizan to the professional man and the small property owner; omitting, on the one hand, the great army of laborers, and, on the other (with few exceptions), the tiny fraction of the population who have incomes from investments exceeding £1,000 a year. They were, of course, selected without the slightest reference to the subject of the inquiry; so little, indeed, was known about them from this standpoint that more than 20 per cent. of them proved to be unmarried, and thus unable to bear testimony. They were invited to give the information desired without revealing their identity, the form being so arranged as to enable it to be filled up by nothing more easily recognizable than crosses and

figures.* Altogether 634 forms were sent out. From these there have to be deducted, for one reason or another, 158—viz., 114 bachelors, 30 duplicates (wives of husbands making returns), five which failed to get delivered by post office, two refusals, five returned blank or incomprehensible, and two relating to marriages abroad. Of the 476 remaining, 174 did not reply. Whether these should be added to the number of those who candidly confessed to having taken steps to regulate the births in their families, or to those who had taken no such steps, or in what proportion they should be distributed between the two, the reader must judge for himself. Significant replies were received from 302 persons. But as 14 of the returns included particulars of two marriages, the total number of marriages of which particulars are recorded is 316. In six cases the papers contain references to second marriages of which insufficient particulars are given. These will not, however, materially affect the results. What is recorded here is the result of 316 marriages, and concerns 618 parents—not, of course, an adequate sample of the people of Great Britain, but, being drawn from all parts of the

* The questions asked are appended :

				Yes.	No.																																								
1. Are you Married?																																													
<i>Those who have been married should return themselves as married.</i>																																													
<i>In cases of second marriages each should be dealt with separately.</i>																																													
<i>A second paper will be sent if desired.</i>																																													
2. Is your Sex Male?																																													
3. Age last birthday?																																													
4. Date of Marriage?																																													
<i>Further returns from persons married before 1870 are not necessary, as the period to be investigated goes back only 30 years.</i>																																													
5. Age of Husband at Marriage?																																													
6. Age of Wife at Marriage?																																													
7. Particulars of Children born (including still-born children) :

* This is only asked for as relevant to the inquiry in cases of deaths under five years of age.																																													
8. Do you expect to have any more (or any) children?																																													
9. In your marriage have any steps been taken to render it childless or to limit the number of children born?																																													
10. If yes, during what years have such steps been taken?																																													
11. Has there been any exceptional cause (such as the death or serious illness of husband or wife) tending to the limitation of the number of your children? (If possible, state the cause)																																													
12. OBSERVATIONS.—Any person willing to add any remarks throwing light on the foregoing return is requested to do so.																																													

country and from every section of the great "middle" class, sufficient, perhaps, until more adequate testimony can be obtained, to throw some light on all the previous statistics.

The first division of the marriages is into two classes; marriages with families intentionally limited, and marriages with families not so limited.

In order to avoid clumsy sentences, the term "limited marriage" will be used to signify a marriage in which the family is intentionally limited, and the term "unlimited marriage" one in which it has not been so limited. The following table gives all the marriages returned, arranged by the date and classified as limited (L) and unlimited (U), together with (1) the number of childless marriages, (2) the number of children born or intended to be born (less deaths up to the age of five years), and the number of marriages in which more children were anticipated. "One or two" is printed as one and a half.

* One of these gives no information as to children.

It will be seen of the 316 marriages, 74 are returned as unlimited and 242 as limited. But in order to ascertain the real prevalence of voluntary limitation as affecting population, certain deductions should be made. Marriages prior to 1875 may fairly be taken out, since the decline of the general birth-rate only began after that date. This eliminates six limited and 17 unlimited marriages, leaving 236 limited and 57 unlimited. Again a usual commencement of limitation appears to be after the birth of at least two children. Marriages contracted in 1903, 1904, and 1905 should therefore be deducted. This leaves 212 limited and 41 unlimited for the period 1875 to 1902, both years included, and including also four marriages the dates of which were not reported, but which almost certainly fall within the period named. But it must be further noted that no less than 13 of the 41 unlimited marriages were childless, and therefore no occasion for limitation arose, unless the parents had desired a childless marriage. This reduces the number of fertile and unlimited marriages during the period 1875 to 1902 to 28 out of 252, or, if the infertile unlimited marriages are deducted, 239.

If we take the decade 1890-1899, which may be regarded as the typical period, we find that out of 120 marriages 107 are limited and 13 unlimited, whilst of these 13 five and possibly six were childless at the date of the return. *In this decade, therefore, only seven or possibly eight unlimited fertile marriages are reported out of a total of 120.*

In order to ascertain the effect of limitation on the size of families let us next take the number of children born and living up to five years of age, of all limited marriages from the earliest recorded (1867) to and including 1903.

NUMBER OF CHILDREN OF LIMITED MARRIAGES.

Children in family	0	1	2	3	4	5	6	7	8	9	11
Marriages ...	39	54	59	29	22	11	6	3	2	1	1
Total Children ...	0	54	118	87	88	55	36	21	16	9	11

That is a total of 227 marriages and 495 children. But owing to second marriages, which are not in all cases fully detailed, nine children must be added, together with an uncertain number (say six) for two other fruitful marriages mentioned but not reported. Altogether the parents of these (say) 510 children number 452. This, however, ignores expected children.

Taking all limited marriages we may next ascertain what is the probable total *intended* fertility. We can state the number of each limited family in this form :

Number living added to the number intended where stated ; and, secondly, number living *plus* an unspecified addition. Cases where the return says "two or three" more children expected are classified as $2\frac{1}{2}$, and "three or four" as $3\frac{1}{2}$. We then get the following results :—

TOTAL EXPECTED FERTILITY OF LIMITED MARRIAGES.

Intended size of family	0	1	2	$2\frac{1}{2}$	3	$3\frac{1}{2}$	4	5	6	7	8	9	11
Completed families ...	33	35	45	4	26	5	21	11	6	2	2	1	0
Families with indeterminate additions ...	9	17	12	—	6	—	4	1	—	1	0	0	1
	42	52	57	4	32	5	25	12	6	3	2	1	1

If we assume the unspecified addition to average one and a half children we find that the 242 marriages have yielded or are intended to yield a total of 619 children and an average of 2.56 children per marriage.

If we take the typical decade 1890-1899 we get the following results :

107 LIMITED MARRIAGES, 1890-1899.

Children living to the age of five ...	0	1	2	3	4	5
Marriages	25	23	34	15	6	4
Number of completed families ("no more expected")	22	17	19	9	4	4
Not recorded or doubtful	1	3	5	2	1	—
More expected	2	1	4	3	1	—
Number of Children expected where indicated	—	$2\frac{1}{2}$	9	1	—	—

This gives 118 living children (excluding deaths of any after five years) and 12 or 13 expected, whilst in 11 cases unspecified additions to the families are anticipated, and 12 cases are doubtful. If one additional child is allowed for each doubtful case and one and a half for each unspecified case, this would give 159 children as the fruit of 107 marriages and of 211 parents (allowing for second marriages in which cases only three persons are concerned in two marriages). This indicates that the offspring of each limited marriage (judging from the period named) is almost precisely one and a half children per marriage. The average number of children to be expected from each marriage, in England and Wales twenty-five years ago, was at least three times as great !

Information as to the causes which had led to limitation was not specifically asked for. But in many papers a large number of valuable details were supplied. Taking all the limited marriages (242) we find the causes indicated as follows :

CAUSES OF LIMITATION.

Economic	38
Sexual ill-health	13
Other ill-health or heredity	19
Disinclination of wife	9
Death of wife	6
Not stated	114
Several causes	43
	<hr/>
	242

Analyzing these last again we find the following causes assigned :

Economic	35 out of 43
Sexual ill-health	11 „ 43
Other ill-health or heredity	19 „ 43
Disinclination of wife	15 „ 43
Death of parent	2 „ 43
Other causes	5 „ 43

The death of a parent, of course, is a cause of *limitation* in another sense from that elsewhere employed in this paper.

Adding the two together we find that, out of the 128 marriages in which the cause of limitation is stated, the poverty of the parents in relation to their standard of comfort is a factor in 73 cases, sexual ill-health (that is, generally, the disturbing effect of child-bearing) in 24 and the other ill-health of the parents in 38 cases. In 24 cases the disinclination of the wife is a factor, and the death of a parent has in eight cases terminated the marriage. It should be added that in one or two cases of marriages in the earlier years tabulated recent deaths of parents are mentioned which could not have affected the size of the families, and these are not included in the above.

It is important not to mistake the character of the evidence which this small voluntary and confidential census yields. It is not, of course, suggested that so tiny a sample of the kingdom affords any valid ground for inference as to the rest of the community. But it does prove, with logically complete demonstration, that the hypothesis suggested by the statistics of the births in the entire population, and of the births among so large a sample as a million and a quarter persons, is a *vera causa*. Volitional regulation of the marriage state is demonstrably at work in many different parts of Great Britain, among all social grades except probably the very poorest. It cannot rightly be inferred from the particulars of so small a number as 316 marriages that it is at work elsewhere *to the same extent* as among them. The statistics indicate, indeed, that (as might have been expected) the voluntary regulation of the marriage state among this tiny sample of (presumably) very deliberate and foreseeing citizens has resulted in a higher degree of restriction of births than among the population at large. This very fact emphasizes the character of the "selection" that is going on. And to the present writer, at any rate, it is the differential character of the

decline in the birth-rate, rather than the actual extent of the decline, which is of the gravest import.

We must, indeed, now take it as proved that the principal, if not the sole, cause of the present continuous decline in the birth-rate in Great Britain is the deliberate regulation of the marriage state. This practice prevails, it must be inferred, either with the object of family limitation, or merely with that of regulating the intervals between births, among at least one-half, and probably among three-fourths, of all the married people in Great Britain of reproductive age—not, as is often imagined, only among those above the ranks of labor, but practically among all classes, from the agricultural laborer in sparsely populated districts, and the artizan in the towns, up to the various grades of professional men and even to the wealthy property owners. The result is that after a quarter of a century of this practice, the total number of children born annually in Great Britain is less than four-fifths of what it would be if no such interference took place. Nor is the practice confined to this country. Dr. Newsholme's statistics of "corrected" birth-rates indicate that New South Wales and Victoria have already carried it much further, whilst New Zealand is not far behind.* Registration in the United States is very imperfect, but it is clear that the American-born inhabitants of New England, and perhaps throughout the whole of the northern states, are rapidly following suit. The same phenomenon is to be traced in the German Empire, especially in Saxony, Hamburg and Berlin, but the German rural districts are as yet unaffected. The Roman Catholic population of Ireland (and of the British cities), as well as those of Canada and Austria, appear to be still almost untouched, but those of Belgium, Bavaria and Italy are beginning to follow in the footsteps of France. The fact that almost every country which has accurate registration is showing a declining birth-rate indicates—though, of course, it does not prove—that the practice is becoming ubiquitous.

These facts—which we are bound to face whether we like them or not—will appear in different lights to different people. In some quarters it seems to be considered sufficient to dismiss them with moral indignation, real or simulated. Such a judgment appears to the present writer both irrelevant and futile. It is impossible, as Burke has taught us, to draw an indictment against a whole nation. If a course of conduct is habitually and deliberately pursued by vast multitudes of otherwise well-conducted people, forming probably a majority of the whole educated class of the nation, we must assume that it does not conflict with their actual code of morality. They may be intellectually mistaken, but they are not doing what they feel to be wrong. Assuming, as I think we may, that, under the best conditions, injury to health, if any, is inappreciable and, in fact, hypothetical only—aware, on the contrary, that the result is to spare the wife from an onerous and even dangerous illness, for

* The inferences to be drawn from the Australasian statistics are disputed. But see the remarkable Report and Evidence of the Royal Commission on the Decline of the Birth-rate and on the Mortality of Infants in New South Wales, 1904.

which in the vast majority of homes no adequate provision in the way of medical attendance, nursing, privacy, rest and freedom from worry can possibly be made—it is, to say the least of it, difficult on any rationalist morality to formulate any blame of a married couple for the deliberate regulation of their family according to their means and opportunities. Apart from some mystic idea of marriage as a “sacrament,” or, at any rate, as a divinely instituted relation with peculiar religious obligations for which utilitarian reasons cannot be given, it does not seem easy to argue that prudent regulation differs essentially from deliberate celibacy from prudential motives. If, as we have for generations been taught by the economists, it is one of the primary obligations of the individual to maintain himself and his family in accordance with his social position and, if possible, to improve that position, the deliberate restriction of his responsibilities within the means which he has of fulfilling them can hardly be counted otherwise than as for righteousness. And when we pass from obligations of the “self-regarding” class to the wider conception of duty to the community, the ground for blame is, to the ordinary citizen, no more clear. A generation ago, the economists, and, still more, the “enlightened public opinion” that caught up their words, would have seen in this progressive limitation of population, whether or not it had their approval, the compensating advantage of an uplifting of the economic conditions of the lowest grade of laborers. At any rate, it would have been said, the poorest will thereby be saved from starvation and famine. To those who still believe in the political economy of Ricardo, Nassau Senior, Cairnes and Fawcett—to those, in fact, who still adhere to an industrial system based exclusively on the pecuniary self-interest of the individual and on unshackled freedom of competition—this reasoning must appear as valid to-day as it did a generation ago.

To the present writer the situation appears in a graver light. More accurate knowledge of economic processes denies to this generation the consolation which the “Early Victorian” economists found in the limitation of population. No such limitation of numbers prevents the lowest grade of workers, if exposed to unfettered individual competition, from the horrors of “sweating” or the terrors of prolonged lack of employment. On the other hand, with Factory Acts and trade union “collective bargaining” maintaining a deliberately fixed national *minimum*, the limitation of numbers, however prudent it may be in individual instances, is, from the national standpoint, seen to be economically as unnecessary as it is proved to be futile even for the purposes for which McCulloch and Mill, Cairnes and Fawcett so ardently desired it.

Nor can we look forward, even if we wished to do so, to the vacuum remaining unfilled. It is, as all experience proves, impossible to exclude the alien immigrant. Moreover, there are in Great Britain, as in all other countries, a sufficient number of persons to whom the prudential considerations affecting the others do not appeal, or appeal less strongly. In Great Britain at this moment, when half, or perhaps two-thirds, of all the married people are regu-

lating their families, children are being freely born to the Irish Roman Catholics and the Polish, Russian and German Jews, on the one hand, and to the thriftless and irresponsible—largely the casual laborers and the other denizens of the one-roomed tenements of our great cities—on the other. Twenty-five per cent. of our parents, as Professor Karl Pearson keeps warning us, is producing 50 per cent. of the next generation. This can hardly result in anything but national deterioration; or, as an alternative, in this country gradually falling to the Irish and the Jews. Finally, there are signs that even these races are becoming influenced. The ultimate future of these islands may be to the Chinese!

Thus, modern civilization is faced by two awkward facts; the production of children is rapidly declining, and this decline is not uniform, but characteristic of the more prudent, foreseeing and self-restrained sections of the community. It is only in mitigation of the first of these facts that it can be urged that the death-rate is also declining, so that in most countries the net annual increase of population exhibits little sign of slackening. This, indeed, affords but slight ground of satisfaction. The probable diminution in the death-rate has very narrow limits; whilst that in the birth-rate is cumulative and limitless. What is of far greater social importance is that a diminished death-rate among those who are born in no way mitigates the evil influence of an adverse selection—it even intensifies its effects.

The conclusion which the present writer draws from the investigation is, however, one of hope, not of despair. It is something to discover the cause of the phenomenon. Moreover, the cause is one that we can counteract. If the decline in the birth-rate had been due to physical degeneracy, whether brought about by "urbanization" or otherwise, we should not have known how to cope with it. But a deliberately volitional interference, due chiefly to economic motives, can at any moment be influenced, and its adverse selection stopped, partly by a mere alteration of the economic conditions, partly by the opportunity for the play of the other motives which will be thereby afforded.

What seems indispensable and urgent is to alter the economic incidence of child-bearing. Under the present social conditions the birth of children in households maintained on less than three pounds a week (and these form four-fifths of the nation) is attended by almost penal consequences. The wife is incapacitated for some months from earning money. For a few weeks she is subject to a painful illness, with some risk. The husband has to provide a lump sum for the necessary medical attendance and domestic service. But this is not all. The parents know that for the next fourteen years they will have to dock themselves and their other children of luxuries and even of some of the necessities of life, just because there will be another mouth to feed. To four-fifths of all the households in the land each succeeding baby means the probability of there being less food, less clothing, less house room, less recreation and less opportunity for advancement for every member of the

family. Similar considerations appeal even more strongly to a majority of the remaining 20 per cent. of the population, who make up the "middle" and professional classes. Their higher standard of life, with its requirements in the way of culture and refinement, and with the long and expensive education which it demands for their children, makes the advent even of a third or fourth child—to say nothing of the possibility of a family of eight or twelve—a burden far more psychologically depressing than that of the wage-earner. In order that the population may be recruited from the self-controlled and foreseeing members of each class rather than of those who are reckless and improvident, we must alter the balance of considerations in favor of the child-producing family.

The question is whether we shall be able to turn round with sufficient sharpness and in time. For we have unconsciously based so much of our social policy—so many of our habits, traditions, prejudices and beliefs—on the assumption that the growth of population is always to be reckoned with, and even feared, that a genuine realization of the contrary position will involve great changes. There are thousands of men thinking themselves educated citizens to-day to whose whole system of social and economic beliefs the discovery will be as subversive as was that announced by Copernicus. We may at last understand what the modern economist means when he tells us that the most valuable of the year's crops, as it is the most costly, is not the wheat harvest or the lambing, but the year's quota of adolescent young men and women enlisted in the productive service of the community; and that the due production and best possible care of this particular product is of far greater consequence to the nation than any other of its occupations. Infant mortality, for instance—that terrible and quite needless slaughter within the first twelve months of one-seventh of all the babies that are born—is already appealing to us in a new way, though it is no greater than it was a generation ago. We shall suddenly remember, too, that one-third of all the paupers are young children; and we may then realize that it is, to the community, of far more consequence how it shall bring up this quarter of a million children over whom it has complete power than the exact degree of hardness with which it may choose to treat the adults. Instead of turning out the children to tramp with the father or beg with the mother, whenever these choose to take their discharge from the workhouse, which is the invariable practice to-day, we should rather jump at the chance of "adopting" these unfortunate beings in order to make worthy citizens of them. Half of the young paupers, moreover, are widows' children, bereft of the breadwinner. For them the community will have to arrange to continue in some form or another the maintenance which the father would have provided had he lived. Above all, in order to put a stop to the adverse selection that is at present going on, we must encourage the thrifty, foreseeing, prudent and self-controlled parents to remove the check which, often unwillingly enough, they at present put on their natural instincts and love of children. We must make it easier for them to undertake family

responsibilities. For instance, the arguments against the unlimited provision of medical attendance on the child-bearing mother and her children disappear. We may presently find the leader of the Opposition, if not the Prime Minister, advocating the municipal supply of milk to all infants, and a free meal on demand (as already provided by a far-seeing philanthropist at Paris) to mothers actually nursing their babies. We shall, indeed, have to face the problem of the systematic "endowment of motherhood," and place this most indispensable of all professions upon an honorable economic basis. The feeding of all the children at school appears in a new light, and we come, at a stride, appreciably nearer to that not very far distant article in the education code making obligatory in the time-table a new subject—namely, "12 to 1 p.m., table manners (materials provided)." One encouragement to parentage in the best members of the middle and upper artisan classes would be a great multiplication of maintenance scholarships for secondary, technical and university education, and the multiplication of tax-supported higher schools and colleges at nominal fees, or even free.

Such a revolution in the economic incidence of the burden of child-bearing will, of course, be deprecated by the ignorant and unthinking, as calculated to encourage the idle and the thriftless, the drunken and the profligate to increase and multiply. The grave fact that we have to face is that, under our existing social arrangements, it is exactly these people, and practically these only, who at present make full use of their reproductive powers. Such a revolution in the economic incidence of the burden of child-bearing as is here proposed would, as a matter of fact, have exactly the opposite result. It would in no way increase the number of children born to those parents whose marriages are at present unregulated. But in the other section of every class of society, where the birth-rate is now regulated from motives of foresight and prudence, it would leave the way open to the play of the best instincts of mankind. To the vast majority of women, and especially to those of fine type, the rearing of children would be the most attractive occupation, if it offered economic advantages equal to those, say, of school teaching or service in the post office. At present it is ignored as an occupation, unremunerated, and in no way honored by the State. Once the production of healthy, moral and intelligent citizens is revered as a social service and made the subject of deliberate praise and encouragement on the part of the government, it will, we may be sure, attract the best and most patriotic of the citizens. Once set free from the overwhelming economic penalties with which among four-fifths of the population it is at present visited, the rearing of a family may gradually be rendered part of the code of the ordinary citizen's morality. The natural repulsion to interference in marital relations will have free play. The mystic obligations of which the religious-minded feel the force will no longer be confronted by the dead wall of economic necessity. To the present writer it seems that only by some such "sharp turn" in our way of dealing with these problems can we avoid degeneration of type—that is, race deterioration, if not race suicide.

SOCIALISM AND CHRISTIANITY.

"I seriously believe that Christianity is the only foundation of Socialism, and that a true Socialism is the necessary result of a sound Christianity."

FREDERICK DENISON MAURICE, 1849.

It is extraordinary how little many Christian people realize the meaning of their own religion, so that they are actually shocked very often at Socialism; and yet all the while Socialism is doing just the very work which they have been commanded by their Master to do. This fact is so obvious that no representative and responsible Christian body can be found to deny it.

Take as an example of this the most representative official English religious gathering possible—the Pan-Anglican Conference of Bishops which met at Lambeth just twenty years ago. These prelates, drawn from all parts of the world, belonging by birth to the propertied classes, by station to the House of Lords, and by tradition to the Tory Party, made a solemn pronouncement on the subject of Socialism. Here, if anywhere, we should find a denial that Socialism was Christian. But no! They turned and blessed it. Here are the words of their Encyclical:—

The Christian Church is bound, following the teaching of her Master, to aid every wise endeavor which has for its object the material and the moral welfare of the poor. Her Master taught her that all men are brethren, not because they share the same blood, but because they have a common heavenly Father. He further taught her that if any members of this spiritual family were greater, richer, or better than the rest, they were bound to use their special means or ability in the service of the whole. . . . It will contribute no little to draw together the various classes of society if the clergy endeavor in sermons and lectures to set forth the true principle of society, showing how Property is a trust to be administered for the good of Humanity, and how much of what is good and true in Socialism is to be found in the precepts of Christ.*

So, then, in 1888, when there was no *Clarion* and no Labor Party, we parsons were told in the most solemn way by our official leaders that we were to be social reformers, to preach the Brotherhood of Man, and to show "how much of what is good and true in Socialism is to be found in the precepts of Christ." In writing this tract, therefore, I am but obeying the instructions of my Fathers in God.

An old agricultural laborer once admitted to me that Socialism was "all backed by Scripture"; and I need hardly remind anyone who reads his Bible, that if I were to put down every passage that

* The next Conference, that of 1897, endorsed this view and, in fact, distinctly strengthened it. So did the last Lambeth Conference in 1908.

makes for Socialism, I should want a pamphlet several sizes larger than this. But nothing is more futile than the unintelligent sling-ing of texts; and I shall therefore confine myself strictly to the *central features* of Christianity, and not pick out chance sayings here and there, since that could be done with the writings of every great moral teacher that has ever lived. Christianity is different. It does not only provide a few noble sayings that Socialists would welcome. It *is* Socialism, and a good deal more.

And because I have only space for the central features of the Christian faith, I must pass over the magnificent utterances of the Old Testament prophets and confine myself to the strictly Christian documents, and in these to the sayings and doings of Christ and His Apostles, with a reference to some leading principles of the Church universal.

How Christ Came.

How did Christ come into the world? That is the most important point of all, the most central. We Christians believe that God the Son became man. He could have come in any class He chose, and the Jews expected the Messiah to appear as a great Prince. If Christ had come thus, as an Oriental potentate, in pomp and luxury, with a crowded harem and troops of soldiers, the influential Jews of the day would have welcomed Him. But He was born in a stable. He came as a working man. He worked at His own trade till He was thirty: and then, choosing other working men as His companions, He tramped about the country as one that had not where to lay His head; doing innumerable secular works of mercy, besides preaching spiritual regeneration; and blessing the poor, while He condemned the rich and denounced the proud teachers and leaders of the national religion; and, after three years, He was executed by the law of the land, because He preached revolutionary doctrines, which the common people "heard gladly," but which were detested by the religious authorities of the day.

This was not only a reversal of all that the Jews expected, but it was also a new phenomenon in the world's history. No one before had ever thought of setting on such a basis the message of social regeneration. Nay, even the noblest of Greek philosophers, the constructors of ideal States, had utterly failed to take account of labor, and had based their ideal republics upon slavery. To Plato, even, the masses had but "half a soul"; while Aristotle, who regarded slaves as "living machines," and women as nature's failures to produce men, wrote: "Certainly there may be some honest slaves and women; nevertheless it may be said that woman generally belongs to an inferior species, while a slave is an utterly despicable being" (*Polit.* i, 13). And in Athens, B.C. 309, the slaves are said to have numbered 400,000 out of a total population of 515,000.

But by the Incarnation not only was labor given its true position, but the unity of the whole human race was proclaimed. Humanity in its solidarity was taken upon Himself by the Divine

Word, and every human being declared to be an infinitely sacred and precious thing, with transcendent rights to the fullest development.

Everybody Knew It.

Nor was there any doubt about it from the first. Christ's Mother knew it as soon as she knew that He was to be born of her ; and she sang that revolutionary hymn, the *Magnificat*, which is still, curious to relate, repeated every day at Evensong in church : "He hath scattered the proud in the imagination of their hearts, He hath put down the mighty from their seats, And hath exalted them of low degree. He hath filled the hungry with good things, And the rich He hath sent empty away" (*Luke i, 51-3*). And at His Nativity there was a similar demonstration of social fellowship as inseparable from true religion : "Glory to God in the highest," the angels sang, "Peace on earth ; Goodwill among men."

The man who was sent as Christ's forerunner, to prepare the way before Him, knew it also. "Every valley shall be filled," he cried (*Luke iii, 5*), "and every mountain and hill shall be brought low," putting the *levelling* principle in a nutshell. And when the people asked him what they ought to do, he just told them to practise communism : "He that hath two coats let him impart to him that hath none, and he that hath food let him do likewise" (*Luke iii, 11, R.V.*)*. Is it not just what Socialists are trying to do—to level up the valleys, to scatter the proud, to fill the hungry by an equal distribution, —and to change an unchristian state of society, under which it is the *poor* who are sent empty away?

The first public utterance of our Lord Himself proclaimed the same social revolution. On that solemn occasion when He began His mission, He went into the Synagogue at Nazareth ; He took the roll of the Hebrew Scriptures, and, out of all the sayings therein, He chose this one : "The Spirit of the Lord is upon me, Because He anointed me to preach good tidings to the poor : He hath sent me to proclaim release to the captives, And recovering of sight to the blind, To set at liberty them that are bruised, To proclaim the acceptable year of the Lord" (*Luke iv, 18, R.V.*). Could anything be more significant ?

Wanted, Orthodoxy.

And now I come to the question, What did Christ Himself teach ? He taught much about God, but He also taught much about men.† Religion has these two sides, and both are of immense importance.‡

* I quote from the Revised Version when it seems to bring out best the meaning of the original.

† Let it be clearly understood. This Tract is not written to belittle the Godward side of religion, or to condone that lack of spirituality which is too common already. But its subject is the Duty to our Neighbor which is as much neglected as the Duty to God.

‡ It is noteworthy that the great Pagan writer, Lucian, was as much struck by the social as by the theological side of the new religion. In the passage where he notices the existence of Christianity, he remarks : "It was impressed on them by their original lawgiver that they are all brothers, from the moment that they are con-

We hear, and we need to hear, a great deal about our Duty to God ; but how about that other Duty which our Lord declared to be "like unto it"—the Duty to our Neighbor? The Church Catechism* teaches all its little children that it is just as imperative to love our neighbor as ourself as to love God. And surely what we have to show Christian folk is not that we want them to embrace some strange new form of Christianity, but that we want them to be faithful to the old ; not to give up their faith, but to hold it in all its fullness ; not to be unorthodox, but to be really orthodox—orthodox about this Duty to their Neighbor, which St. John, the most profoundly spiritual of all the Bible writers, declares to come before the Duty to God : "For he that loveth not his brother whom he hath seen, how can he love God whom he hath not seen?" (1 *John* iv, 20).

What, then, was the social teaching of that Man, who came to reveal God to men, and yet whom St. Peter described afterwards (*Acts* x, 38) as one who "went about doing good"? We will take the four most prominent forms of His teaching—His Signs, His Parables, His Sermon, His Prayer.

Christ's Signs.

Very often when we go into church we find the congregation singing some hymn which expresses the utmost weariness of life and the keenest desire to die and pass to the "better land." Stout old gentlemen and smart young women sing it lustily ; and we know that they are singing a lie ; for if they were told that they were to die to-morrow, they would not find it at all weary "waiting here." That is an instance of the heresy of modern popular religion. Christ taught exactly the opposite. The vast majority of His miracles restored men to health and life, and enabled them to go back to their work, and to enjoy the measure of life which God allots to mankind. Death in old age, when a man's work is done, is not a sad thing ; but death in youth, or in the prime of life, is piteous, horrible, abnormal ; and so are sickness and deformity.

Christ, then, devoted a large portion of His time to fighting against disease and premature death, and He wept when a friend had been carried off in his prime. Our Bible often calls these acts miracles ; but this is a mistranslation of the original Greek, which calls them *signs*—that is, significant acts. If we, then, realize their significance, if we are imitators of Christ in this, too, according to our power, we shall heal sickness, and fight against disease and death, in the workshop and in the slum dwelling ; since all sanitary and social reform is but carrying out on a larger scale the signs which our Lord wrought for our example.† For instance, of the children

verted. . . . All this they take quite on trust, with the result that they despise all worldly goods alike, regarding them merely as common property." Lucian's *Works* (H. W. and F. G. Fowler's translation), vol. iv, p. 83.

* For a Socialist study of the Catechism see Mr. Stewart Headlam's *Laws of Eternal Life* (London, Guild of St. Matthew, 376 Strand, W.C., 3d.).

† "He that believeth on me, the works that I do shall he do also ; and greater works than these shall he do ; because I go unto the Father" (*John* xiv, 12).

that are born in the working classes, about one-half die* before they are five years old. And yet, if we even offend or despise one of these little ones, He tells us (*Matt.* xviii) it were better for us that we were cast into the sea with a millstone about our neck! It is surely no empty form that to the most respectable congregations it is said from the altar Sunday after Sunday, "Thou shalt do no murder." For we are all sharers in this ghastly holocaust, and the blood is on our hands, unless we are laboring with all our power to prevent it.

But, further, we learn from the signs of Christ not only to save life and health, but to increase its comfort, as He did at the feeding of the multitudes—and its merriment, as He did at the Cana marriage feast.

Christ's Parables.

Many of the Parables, too, deal with social questions. Many are terrific attacks on money-making, and one was the inspiration of that epoch-making treatise on economics, Ruskin's "Unto This Last." Another was commonly supposed to be difficult only because people did not see that money, the "Mammon of unrighteousness," must be used so as to make friends—not of Mammon, but of men,† and not enemies—a Socialist moral, as Archbishop Trench himself explained in his standard work on the Parables.

Another, that of the Good Samaritan, it is very necessary to remember for this reason: that it gives an entirely new meaning to the word "neighbor." When the Jew said "Love thy neighbor as thyself," he only meant "Love thy people," thine own tribe, as was taught in the Old Testament.‡ But when Jesus, in answer to the question "Who is my neighbor?" (*Luke* x, 29) told the story of the Good Samaritan, He expressly showed that He meant by neighbor every human being all the world over, including "enemies" even. Now, as there is no other reference to the Golden Rule in the Old Testament but this one in Leviticus, which confines it to relations, it is not really true to say that our Lord, in saying "Love thy neighbor," etc., and "Do to others," etc., was only repeating an Old Testament maxim. It was, as He said, "a new commandment."§

And here I would point out the meaning of a whole series which are called the "Parables of the Kingdom." They expressly confute the common notion that the Kingdom of Heaven is something only in the next world, and that men are set only to save what Kingsley called "their own dirty souls." For these Parables are quite unintelligible unless we believe that our Lord came to found a great

* According to Dr. Playfair, 55 per cent., as against 18 per cent. among the rich.

† "Make to yourselves friends *by means of* the mammon" (*Luke* xvi, 9, R.V.).

‡ "Thou shalt not avenge, nor bear any grudge against the children of thy people, but thou shalt love thy neighbor as thyself" (*Leviticus* xix, 18).

§ "A new commandment I give unto you, That ye love one another" (*John* xiii, 34). Maundy Thursday owes its name to this *novum mandatum*, or new commandment. The three chapters of this Great Discourse (*John* xiii to xvi) should be carefully studied.

human Brotherhood, a kingdom which He called His Church, here on the earth. He came expressly to found this society, of which the New Testament is so full ; He came thus on a social mission to bind men together in love, as well as to purify their individual souls. And so He said that this "Kingdom of Heaven" was like a draw-net (*Matt.* xiii, 47), not consisting only of converted persons, but of every kind ; and like a field (xiii, 24) where the tares and wheat grow together ; like a grain of mustard seed (xiii, 31) in the way, it should grow ; and like leaven (xiii, 33) which should spread till it had made the whole world good.

But the last parable He ever uttered is the most important of all ; because in it He told men by what they were to be judged at the Last Day. If we know how we shall be judged, then we know what we have to do—how we are to be true Christians. And what does this great Parable of the Judgment (*Matt.* xxv, 31-46) tell us will settle our fate in the next world ? Extraordinary to relate, it is just the opposite to what the professedly religious world has been saying, and just the very thing that the Socialists teach. We shall be saved or condemned according to our acts of social service, Christ tells us, saying nothing about church-going, or conversion, or orthodoxy ; for these latter are nothing unless they are so genuine as to have a practical result. "Faith without works is dead" (*James* ii, 14-26). We shall be placed on His right hand if we have fed and clothed and helped others—not merely among our own friends, for sinners do that * but those who cannot help themselves ; and our Lord, in a magnificent passage, asserts the solidarity of all mankind in Him, by identifying Himself even with the poor wretch in an unspeakable Eastern prison. Then, turning to those on His left, He says : "Depart from me, ye cursed, into the eternal fire," not because you were heathens or agnostics, but because "I was an hungered and ye gave me no meat : I was thirsty, and ye gave me no drink : I was a stranger, and ye took me not in ; naked, and ye clothed me not ; sick and in prison, and ye visited me not. . . . Inasmuch as ye did it not to one of these least, ye did it not unto me."†

Christ's Sermon.

And this great principle, that what we do is of far more importance than what we profess, is made the clinching passage of the Sermon on the Mount (*Matt.* vii, 16-26)—"By their fruits ye shall know them. Not every one that saith unto me Lord, Lord, shall enter into the Kingdom of Heaven, but he that doeth the will of my Father." What that Will is we shall see further on. But here

* "For if ye love them which love you, what thank have ye ? for sinners also love those that love them. And if ye do good to them which do good to you, what thank have ye ? for sinners also do even the same. And if ye lend to them of whom ye hope to receive, what thank have ye ? for sinners also lend to sinners, to receive as much again" (*Luke* vi, 32-4).

† St. Basil, in his Homily on Riches, shows the feeling of the early Church about this parable when he says : "The robber is not even arraigned [at the Day of Judgment], but the unsocialist [*ho akoinonetos*] is condemned [*katakrinetai*]."

I will point out how this Sermon directly contradicts modern individualism, both secular and religious.

Our religious individualism is condemned in three prominent characteristics—its self-righteous censoriousness ("Judge not . . . Thou hypocrite, first cast out the beam out of thine own eye"—vii, 1-5); its parade of "charity," falsely so called, and subscription lists ("But when thou doest alms, let not thy left hand know what thy right hand doeth: that thine alms may be in secret: and thy Father which seeth in secret shall recompense thee" *); its love of cant ("And when thou prayest thou shalt not be as the hypocrites are; for they love to pray standing in the synagogues and in the corners of the streets"—vi, 5, 6).

And now for what the Sermon says about secular individualism. Here are the Beatitudes, with which the Sermon begins, printed by Ruskin side by side with their modern perversions:—

CHRIST.

Blessed are the poor in spirit: † for theirs is the Kingdom of Heaven.

Blessed are they that mourn: for they shall be comforted.

Blessed are the meek: for they shall inherit the earth.

Blessed are they which do hunger and thirst after righteousness (*dikaïosunē* ‡); for they shall be filled.

Blessed are the merciful; for they shall obtain mercy.

Blessed are the pure in heart: for they shall see God.

Blessed are the peacemakers: for they shall be called the children of God.

PRESENT-DAY.

Blessed are the rich in flesh: for theirs is the Kingdom of Earth,

Blessed are they that are merry; and laugh the last.

Blessed are the proud: in that they have inherited the earth.

Blessed are they which do hunger and thirst after unrighteousness (injustice): in that they shall divide its mammon.

Blessed are the merciless: for they shall obtain money.

Blessed are the foul in heart: for they shall see no God.

Blessed are the war-makers: for they shall be adored by the children of men.

To which one might add two further parallels to the two remaining Beatitudes:—

Blessed are they which are persecuted for righteousness' sake: for theirs is the Kingdom of Heaven.

Blessed are ye, when men shall revile you, and persecute you, and shall say all manner of evil against you falsely for my sake.

Blessed are those who persecute the lovers of justice: for they prevent the Kingdom of Heaven.

Blessed are ye, when the Press shall speak well of you, and praise you; for so did their fathers to the false prophets.

Besides this, the following principles are also taught in the Sermon on the Mount: Love of our enemies, anger being a form of murder (*Luke* vi, 27; *Matt.* v, 21-44); affirmation instead of oaths;

* *Matt.* vi, 1-4, R.V. Not "Shall reward thee *openly*," which is a late addition by some scribe who hankered after antithesis and so destroyed the real point.

† St. Luke has simply "the poor," and follows immediately with "Woe unto you that are rich"; and scholars think that St. Luke gives the original which was modified by St. Matthew. (See, e.g., *The Study of the Gospels*, by the Dean of Westminster, pp. 76, ff.) "Poor in spirit," of course, does not mean poor-spirited, but simply the not caring about private property. Poverty in Christ's time *did not imply pauperism or degradation*, but such a simple life as the fishermen-apostles lived.

‡ *I.e.* "justice": see p. 15.

avoidance of capital punishment, and of all litigation and retaliation (*Matt.* v, 33-41); a warning that we are not to insist on the "rights of property" (v, 40); a command to give to every one that asks our help (v, 42); a command to lend without asking interest or even the principal back (*Luke* vi, 34, 35); the wrongfulness of all forms of "making money" (*Matt.* vi, 19-21), and the consequent impossibility of serving God if we serve Mammon (vi, 24); that "thrift" is not the right way to abolish poverty (vi, 25-34). But that God wishes all men to have good food, and drink, and beautiful clothes (vi, 29-32), without either the grinding worry of poverty or the deadening lust of riches (vi, 24, 31, 34); and that this happy state of things is to be obtained by our seeking, first of all, two things—the holy brotherhood and the justice of God. "Seek ye first the Kingdom of God and His righteousness, and all these things shall be added unto you" (vi, 33). Seek ye first the divine society and the divine justice, and all these things—clothes more beautiful than Solomon's, and good food and drink—shall be added unto you. Be social, godly, just, and you shall have Utopia. But the modern world is anti-social, selfish, unjust, and we have—London!

It may be urged that some of these precepts of the Sermon are ideal, and not practicable under present conditions. This is true. But it proves that a social system under which the precepts of Christ cannot be carried out is not a system which Christians can be content with. Christianity is in fact far ahead of us; and we have to assist in developing society in the direction of this ideal. So far as we can see, that direction is also the direction of Socialism; although as man develops from his present rudimentary condition to the glorious future which evolution and the Gospel foretell, he may pass beyond the ideal of present-day Socialism to something vaster and more sublime.

Christ's Prayer.

A prayer is generally considered a particularly "other-worldly" thing, or, at least, when it is concerned with this world, it is nearly always selfish and limited, like the prayers children are taught—"Bless father and mother, and make Tommy a good boy," which curiously illustrates how general is the narrowing of modern religion, and grows naturally in after years to—

Bless me and my wife,
My son and his wife,
Us four and no more. Amen.

Our Lord gave us only one prayer, and that quite short, for He set it as a model on which all prayer was to be based. How far we have departed from that model will be clear if we consider its clauses one by one.

The Lord's prayer was originally given for private use.* Here, then, if anywhere, we shall find Individualism! Let us see. The Prayer contains seven petitions and three extra clauses. *None* of

* "But thou when thou prayest, enter into thy closet, and when thou hast shut thy door, pray to thy Father which is in secret" (*Matt.* vi, 6).

these ten parts are individual ; *all* are social, three of the petitions are distinctly what some people would call "worldly," while the three extra clauses are specially inserted to insure the social application of the rest.

OPENING CLAUSE.—"Our Father which art in heaven." At the very outset Individualism is renounced ; though we pray "in secret" we have to say "Our," and to include all humanity in our prayer, approaching God as the common Father of the whole human family. And no one can say "Our Father which art in heaven" unless he has first said "Our brethren which are on the earth."

1ST PETITION.—"Hallowed be thy Name." The first Petition, like the two next, refers to this world. There should be no full-stops between this petition and "In earth as in heaven." In Westcott and Hort's Greek Testament, which represents the high-water mark of biblical scholarship, the clauses are thus printed :—

Our Father which art in heaven :
Hallowed be thy name,
Thy kingdom come,
Thy will be done,
In earth as in heaven :

How, then, is God's Name to be hallowed here upon the earth? Certainly not by a state of things under which in London alone 1,400,000 people* are living in want ! If blasphemy in word is wrong, how about blasphemy in *deed* ? Whenever we make any earthly matter the mirror of the love and justice of God we are hallowing His Name, for we are vindicating His righteousness ; but where is the love or justice in modern trade, or politics, or diplomacy? Ask a City man, and he will reply, with a smile, that business is business ; by which he means that selfishness must be supreme, untinged by any thought of mutual love or justice. Indeed, a few years ago, before the Socialist protest, every political economist would have told you that men can only be reckoned with as "covetous machines." Now, this is the real blasphemy, the real atheism and materialism. It has driven thousands of working men into revolt against God, because they felt they could not believe in a loving Father when they saw the blank misery and oppression all around them. Yet God made the country, God places man amid lovely surroundings, which are the glory and delight of poet and artist ; and man, modern commercial man, has made the hideous modern town, which shuts out every ennobling influence from those who have to live in it. In fact, it is generally admitted by the most conservative people that "the devil made the town"—that prince of jerry-builders ! To hallow God's name, then, we must make the world a mirror of His love and beauty and justice.

2ND AND 3RD PETITIONS.—"Thy Kingdom come, Thy will be done." God has given man free-will because it is better to be free and imperfect than to be an irreproachable machine. But God's evolution of the world is towards perfection. Therefore Socialists

* Charles Booth, *Life and Labor*, ii, 20-1.

are right in believing in Utopia ; and as Christians we are bound to be Utopians. People often object that we are dreamy, unpractical people, because we are idealists. But everyone who says the Lord's Prayer definitely proclaims himself a fellow-worker with God for a perfect social state ; he prays for a heaven on earth, for God's will to be as perfectly done here as it is in heaven, for men to be as perfect as the angels, and for this divine evolution to take a social form in the "Kingdom of God." He is *bound*, then, to believe that all our struggles for social and moral reform are leading us to a Utopia. As Ruskin says : "When you pray 'Thy Kingdom come,' you either want it to come or you don't. If you don't, you should not pray for it. If you do, you must do more than pray for it—you must live for it, and labor for the Kingdom of God."

2ND EXTRA CLAUSE.—"In earth as it is in heaven." Our Lord inserts this to make it quite clear that He does not mean us to use the three foregoing petitions in an unreal or other-worldly sense.

4TH PETITION.—"Give us this day our daily bread." When it is evening, and the day's work is over, you are still bound to say this prayer ; for it is morning on the other side of the earth, and there are hungry people in the Antipodes. When your larder is full, you must use it none the less ; for it is not "Give me," but "Give us." And it is not "Give me my daily seven-course dinner and champagne," but "Give us our daily bread." Here, in this short prayer, Christ yet found room for a thorough statement of our most mundane needs—necessities for *all*, but harmful luxuries for no one. If, then, a rich man uses this prayer, he is morally bound to distribute his excess, from his luxury to supply other men's necessities, and to labor for a more equal distribution of wealth.* For what one man has another cannot have, and every penny one man has above the average product of society forces some one else to have less, and perhaps to lack his "daily bread."

5TH PETITION.—"And forgive us our trespasses." Well, you may say here, at least, is something that has nothing to do with Socialism ! Hasn't it ? Look again.

This also has an EXTRA CLAUSE attached to it, so careful was our Lord to guard against Individualism—"as we forgive them that trespass against us." Here, even here, then, the Christian Faith is social, corporate, reciprocal ; and as we shall be judged by our treatment of our brother, so by our conduct towards him we are forgiven. Christ never allows us to get away from this neighbor of ours. Therefore it was only to be expected that modern heresy should have raised a cry directly the opposite of Christ's principles. "No man shall come between me and my God," is that cry—as if they

* See, for instance, *Luke* iii, 11, already quoted on page 5, "He that hath two coats," etc. ; *James* ii, 15-17, R.V., "If a brother or sister be naked, and in lack of daily food, and one of you say unto them, Go in peace, be ye warmed and filled ; and yet ye give them not the things needful to the body ; what doth it profit ? Even so faith, if it have not works, is dead in itself" ; and also *1 John* iii, 17, "But whose hath the world's goods," etc., quoted on page 15.

would make private property even of the Almighty! But the teaching of the Lord's Prayer is that *every man* shall come between me and God. God will not even forgive us, unless we "forgive our debtors."

6TH PETITION.—"Lead us not into temptation." It may be objected that nothing so far has been in favor of Economic Socialism, of State Collectivism. That is quite true; for if our Lord had taught economics, instead of religion with its two great Duties, He would never have led the world to brotherhood at all: all real economic and legislative reform has been the *effect* of moral regeneration; it can never be its cause. True Socialism * is a much larger thing than Collectivism, which is but the means for realizing it under present conditions. When humanity has established Collectivism, it might very possibly pass on to Communism; and, after some centuries of Communism, humanity might become pure enough to live without laws at all, which would really be Anarchism. Christ taught for all time; and, if He had insisted on Collectivism, men would never have become unselfish enough to attain it; if they had, His teaching would have grown out of date. But His teaching and His example are always in advance of us, and thus we are able to develop.

But it is clear to my mind that this 6th Petition teaches us to be Collectivists at the present stage of the evolution of society. "Lead us not into temptation." Clearly if we twentieth century folk were Anarchists, we should be living in overwhelming temptation; and if you and I, my Socialist friend, were living as Communists, I am afraid we should find that Tom, Dick, and Harry, not to mention Levi and Cohen, would be tempted to take advantage of us. But the State in which we do happen to live is Individualistic, and I need hardly remind you that under this present competitive system the atmosphere of temptation is terrific. In the office and the workshop, in the studio and behind the counter, all day long the voices cry: "Make money, honestly if you can; but, at all events, make money! If you want to get on, you mustn't mind shouldering So-and-so out of the way. You must look after Number One. Every man for himself, and the devil take the hindmost!"

Now, I think this, more than anything else, has made me a Socialist. I know that money is the main cause of the awful temptations of these modern times, which have seriously made a new gospel, not of good-will towards men, but of "Self-help"; and I want not only to be freed from this temptation myself, but I want "us" to be freed from it, for I know that it is destroying all our nobility of character. If I want, then, mankind not to be led into temptation, I cannot support the present competitive system.

* "The method of Socialism is co-operation, the method of Individualism is competition. The one regards man as working with man for a common end, the other regards man as working against man for private gain." *Socialism*, by B. F. Westcott, late Bishop of Durham, p. 4 (Price 1d. Christian Social Union Pamphlet, No. 3, from Mowbray, 28 Margaret Street, W.). See also Bishop Westcott's *The Incarnation, a Revelation of Human Duties* (S.P.C.K., Northumberland Avenue, 6d.).

Only one means of escape can I see, and that is to destroy material competition, which every page of the Bible condemns, and to establish, so far as possible, the collective ownership of the means of production, distribution, and exchange. We cannot at present do away with money in some form, although we are told that money is a root of all evils (1 *Tim.* vi, 10, R.V.). But we can, by putting money into the common purse, minimise the temptation, till humanity is ready for a further step. Thus are we to apply to our present conditions the eternal principles which Christ gave us, and which He gave just that we might apply them from age to age, till God's will is perfectly done, and the whole lump is leavened. Can anyone produce a better way of doing this than State Socialism? If not, then let us be State Socialists.

LAST PETITION.—“But deliver us from evil.” Unsocial Christians have to learn from this how much of the evil is social, of “the world” as the New Testament so often says, using the word “*cosmos*,” which means in the Greek “the order of the world,” just as we say “the present social system.” And Materialistic Socialists have to learn that it is Evil from which we have to be delivered. Nothing is so shallow as to think that our social disorder is due to economic machinery which can be altered without any change in men's hearts; that is just the stupid materialism of the old political economy turned inside out. Our disorder is due to the evil which made this machinery; it continues because there is so much evil that men tolerate this machinery. Our statute-book is what it is because men are what they are: Socialist Acts of Parliament are only passed as men become more social; and some of the best of those Acts are a dead-letter to-day because men are too selfish to enforce them. When there is less evil in the world, less of that original sin for which the modern name is Individualism, then, and not till then, will the Parliament which *we* elect, and the autocrats which Slav and Teuton working men hold upon their thrones, allow Socialism to be established. You cannot, it is most true, make humanity good till you have made its environment good; but it is also true that you cannot make that environment good till you have made men better. The two must improve each other. And the perfect State will consist of perfect men and women.

Having now some idea of the drift of Christ's teaching, let us consider a little more fully the two leading principles of Socialism—Brotherhood and Common Wealth—in the light of the whole New Testament.

Brotherhood.

I need hardly dwell on this. Every Christian admits it—in theory, and would be surprised if the parson addressed his flock as “ladies and gentlemen” instead of “brethren.” We only have to make Christians true to the religion they profess, and to have the same religion for week-days as for Sundays. We only have to make the respectable church-goer understand that it is really devilish to stand aloof from those whom he may think beneath

him, since St. John says that "In this the children of God are manifest, and the children of the devil: whosoever doeth not righteousness, is not of God, neither he that loveth not his brother" (1 *John* iii, 10).

The pity of it is that many a professing Christian does not know anything about this brotherly love. He forgets that he has to love his brother *as himself*; and so the very word "charity" has lost its true meaning, and is even applied to those petty forms of almsgiving which may justly be called the crumbs that fall from the rich man's table.

What we falsely call "charity" the New Testament calls ALMSGIVING, and our Lord, the first time He mentions it, calls it *justice* (*Matt.* vi, 1, R.V.). And yet, when some one cries, "We want justice and not charity," we think he is proclaiming a brand-new Socialist doctrine! The real CHARITY is described at length by St. Paul (1 *Cor.* xiii) as something that "seeketh not her own," but is patient, kind, generous, modest (v. 4), courteous, good-tempered, guileless (v. 5), honest and sincere (v. 6), confident and brave (v. 7). And this virtue is proclaimed by St. Paul as the greatest thing in the world, greater even than faith and hope—two virtues, by the way, which are almost equally necessary for the social reformer. Further, St. John says of this virtue (our translators for some extraordinary reason translated it "love" in St. John, but it is the same Greek word), that if we dwell in it we dwell in God Himself (1 *John* iv, 16), and that "every one that loveth is born of God and knoweth God" (iv, 7), while "he that loveth not" (however much he goes to church) "knoweth not God." And it is remarkable that while St. John includes the love of God in this Charity, he expressly describes it as a social virtue—"But whoso hath the world's goods, and beholdeth his brother in need, and shutteth up his compassion from him, how doth the love of God abide in him?" (iii, 17, R.V.). He expressly declares that God is Love, and yet this Divine Love is analyzed by St. Paul as made up of acts of love *to men*.

As the inspired William Blake wrote—

Love seeketh not itself to please,
Nor for itself hath any care,
But for another gives its ease,
And builds a heaven in hell's despair.

There is another virtue necessary to brotherhood, which is a watchword with Socialists. It is JUSTICE. You may not think that it occurs often in the Bible. But it does occur eighty-six times. For every time you find the word "righteousness" you may read for it "justice." The word in the original Greek is *dikaïosunē*, which means justice, and is so translated in the Latin Vulgate by *justitia*. No doubt "righteousness" had a much broader sense originally, and should mean more than "justice" instead of less; but it has been degraded, like the word Charity, by modern use. Remembering this, observe that our Lord spoke of "the unrighteous Mammon," that is, of riches as an unjust thing; that He said, "Blessed are they which hunger and thirst after Justice."

Every Socialist knows that a main offence against brotherhood is *Idleness*, and he claims that every idler is in fact a criminal. St. Paul is with him, "If any will not work, neither let him eat" (2 *Thess.* iii, 10, R.V.); work, he says, in another place (1 *Thess.* iv, 12), "that ye may walk honestly," being unable to conceive of an honest idler. The Communion Service, too, is with him, "Six days shalt thou labor," with a provision for a weekly holiday. The Catechism is with him, "My duty to my neighbor is . . . to learn and labor truly to get mine own living, and to do my duty in that state of life unto which it *shall* please God to call me." Not "has pleased to call me," as it is generally misquoted. The Catechism does not say that men should be kept down, but that wherever the young may find themselves in after life they are to do their duty. And Jesus Christ gives no invitation to the idler, "Come unto me all ye that *labor*."

There is a Socialist song which tells of the time when there shall be "no master"; and here again they can quote our Lord's own words. "One is your Master, even Christ," "and all ye are brethren" (*Matt.* xxiii, 8, 10), "Ye know that they which are accounted to rule over the Gentiles lord it over them; and their great ones exercise authority over them. But it is not so among you; but whosoever would become great among you, shall be your servant: and whosoever would be first among you shall be bond-servant of all. For verily the Son of Man came not to be ministered unto [waited upon], but to minister" (*Mark* x, 42-5, R.V.). It has been rather stupidly objected that St. Paul was in favor of slavery because he told servants to obey their masters. But we have only to remember that the early Christians were so full of the spirit of revolt against the "world" or society under which they lived, that they often had to be held back from ruining the whole cause by disorderly conduct. They knew that they were free, that God was no respecter of persons (*Acts* x, 34), and that however respectable a man was, if he approved of class-distinctions, he was "guilty of all" sin.* Therefore St. Paul, who was famous as a man that had "turned the world upside down" (*Acts* xvii, 6), had to tell them that nevertheless they must stick to their work.† He took pains to point out that the Christian slaves (who were as churchmen on a perfect equality with the patrician

* *James* ii, 1-10. See especially vv. 5-9 (R.V.)—"Did not God choose them that are poor as to the world to be rich in faith, and heirs of the kingdom which he promised to them that love him? But ye have dishonored the poor man. Do not the rich oppress you, and themselves drag you before the judgment seats? Do not they blaspheme the honorable name by the which ye are called? Howbeit if ye fulfil the royal law, according to the scripture, thou shalt love thy neighbor as thyself, ye do well: but if ye have respect of persons, ye commit sin."

† This is also true of the early Fathers. They drew a distinction between "natural law" and "human law." They all agreed that both private property and slavery were not in accordance with natural law, being due to man's sinful condition; but they held that they were justifiable under human law. At the same time they taught that to give up both private property and slaves was a good deed, and they set the example of doing so themselves. See A. J. Carlyle, *Medieval Political Theory in the West*, and Professor Nitti, *Catholic Socialism*.

Christians) were to do their service, "not to men," but "as to the Lord" (*Eph.* vi, 7), and he repeats this when he writes to the Colossians, "Servants . . . whatsoever ye do, do it heartily as to the Lord, and not to men. . . . and there is no respect of persons" (*Col.* iii, 22-5). What St. Paul taught when he wrote to a master may be read in his little letter to Philemon, which is an appeal to a master to receive back a runaway slave, but "not now as a servant, but above a servant, a brother beloved" (*Phil.* 16). And, as a matter of history, wherever the Church has been, she has emancipated the slaves, and vindicated the dignity of womanhood.

If we try for a moment to apply the law of Christian brotherhood to our present conditions, it is clear that they cannot stand for one moment before it. All monopolies would go, all class-distinctions would go, and war would be no more. Society would become Socialist, for we are not to lay up treasures *for ourselves* upon the earth (*Matt.* vi, 19), we are each to labor, and not to take interest upon capital (*Luke* vi, 34, 5)—interest being the great modern means of obtaining money without working for it—we are not to maintain our own rights of private property (*Matt.* xix, 21 ; *2 Cor.* ix, 9 ; *Luke* xii, 13-21), but are to work in complete co-operation and harmony one with another (*1 Cor.* 12). We are to love our neighbor as *ourself*, to vote for his interests as our own, to educate his children as we would like our own educated, to feel his wrongs as wrongs done to us—in fact, as an early Christian writer says, "both to work and pray to get him all the good things we have ourself."* We are to do to him as we would have him do to us were our places changed ; and "this is the law and the prophets" (*Matt.* vii, 12). That goes much further than the Socialist maxim, "Each man counts as one, and no man as more than one."

Thus, if our brother is poor, we must labor for his release from the grinding, harassing toil which shuts out from him the higher things of life.

Ah ! but if he is rich, you say, ought we not to congratulate him on his prosperity, and regard his property rights as sacred ?

Common Wealth.

Pardon me, my friend. If you are a Christian, and love your rich neighbor as yourself, you will do all you can to help him to become poorer. For if you believe in the Gospel, you know that to be rich is the very worst thing that can happen to a man. That, if a man is rich, it is with the greatest difficulty that he can be saved ; for "it is easier for a camel to go through the eye of a needle, than for a rich man to enter into the Kingdom of God" (*Mark* x, 25). This is startling now, but it was not less strange and startling to the disciples, who "were astonished out of measure, saying among themselves, Who then can be saved?" But the needle's eye has not grown any larger since then, and the camels certainly have not grown smaller !

* St. Justin Martyr, *Tryphon*, 95.

Certain very superior persons, even among Socialists, have blamed Jesus Christ for so often denouncing the rich. But this is just wherein He showed His wisdom. It was a perfectly new idea at the time; for even the disciples, who were not rich, were shocked. But after hearing it for nineteen hundred years, Christendom still acts as if it were peculiarly difficult for a *poor man* to enter the Kingdom. And as we look round at both Church and Nonconformist governing bodies, boards of management, and representative assemblies, or at their clergy—bishops, priests, and deacons, Dissenting ministers and pastors—we find as a matter of fact that the poor man *is* excluded, and that the rich have somehow or other all squeezed through the needle's eye, and have comfortably taken over the direction of the poor man's Kingdom! And the State is worse than the Church; for at this moment in democratic America every member of the Cabinet but one, according to the *Spectator*, is a millionaire.* Can we blame, then, our Lord for putting the case so strongly, since even now it has not yet been driven into our greedy heads? As a matter of fact, the undesirableness of riches is the hardest lesson for man to learn; and he *has* to learn it, if Socialism is to be established on mutual love, or for that matter if it is to be established at all, because otherwise it is impossible.

How strongly our Lord enforced the lesson I need not remind you. People sometimes try to get out of the Parable of Dives and Lazarus by calling it the Parable of the Bad Rich Man.† It is not: it is the Parable of the Rich Man.‡ Dives was an ordinary person, who was not without the ordinary good nature of the selfish, for he at least allowed Lazarus the hospitality of his doorstep; whereas nowadays we should send at once for the policeman if Lazarus attempted such a thing. We are told why Dives was punished in Hades: "Son, remember that thou in thy lifetime receivedst thy good things, and likewise Lazarus evil things" (*Luke* xvi, 25).

All true Christians, then, must desire to relieve the rich man of his excess for his own sake, since the inequality that ruins the body of Lazarus ruins the soul of Dives; and Dives is the more miserable of the two, because the soul is more precious than the body.

* This was written in 1897; but in 1907 the power of the millionaire has not decreased in America. On the other hand the religious bodies are certainly more democratic, on both sides of the Atlantic, than they were.

† Old-fashioned Bibles give this parable the title of "The rich Glutton," which shows how our grandfathers shut their eyes to its meaning. They might as well have called it "The rich Dandy"; and indeed there is nothing about gluttony in the parable, the words translated "fared sumptuously" being better rendered by "living in mirth and splendour," as in the R. V. margin.

‡ St. Augustine well says on this point, "Jesus said not, a calumniator; He said not, an oppressor of the poor; He said not a robber of other men's goods, nor a receiver of such, nor a false accuser; He said not, a spoiler of orphans, a persecutor of widows,—nothing of all these. But what did He say? '*There was a certain rich man.*' And what was his crime? The Lazarus lying at his gate, and lying unrelieved." Augustine, *Serm.* clxxviii, 3.

St. James perfectly understood this great truth that the social revolution will be really a blessing for the rich. He stated it in the clearest terms: "Let the brother of low degree rejoice in that he is exalted: but the rich in that he is made low: because as the flower of the grass he shall pass away" (*James* i, 9, 10). This passage, by the way, happens to be the special Epistle for May 1st, which is St. Philip and St. James' Day, and therefore it has been read throughout the Church on every Labor Day for about 1,500 years. It is still bound to be read every May Day. Outside, the Socialist procession may be singing the reactionary Marseillaise, but in church the reactionary Vicar is reading to his people the Socialist message of St. James! It is a wonderful world we live in.

The identity of true Socialism with true Religion is nowhere more clearly shown than in the Christian teaching about riches. The great rival power to God is not any of the common bugbears of the religious world—not heathendom, or popery, or the public-house, or the theatre—but Mammon. If, then, we are fighting against the power of riches, we are essentially Christian. "Ye cannot serve God and Mammon" (*Matt.* vi, 24; *Luke* xvi, 13). And St. Paul makes it still clearer when he says (*Col.* iii, 5) that idolatry, the worship of a rival to God, is covetousness. The common religious notion of idolatry is that it consists in putting up graven images in church; but the New Testament has given the word a different meaning—it is the worship of the graven image upon a coin. Covetousness is now so openly professed that the economists have built a science upon it; yet St. Paul more than once mentions it as an equally disgraceful thing with nameless vices; to take a milder instance, he says (*Eph.* v, 5): "No whoremonger, nor unclean person, nor covetous man who is an idolator hath any inheritance in the Kingdom of Christ." And covetousness was the sin of Judas.

Once more, I repeat it. If the love of money is a root of all evils (*1 Tim.* vi, 10), we can only make the people good Christians by making the State the common trustee, which shall pay us all justly for work duly done; "not looking each of you to his own things, but each of you also to the things of others" (*Phil.* ii, 4, R.V.).

The Christian Church.

What did the first Christians do when their Church was settled in Jerusalem? They lived as Communists.* They must have known what the Master really meant, they had heard Him speak, and knew thousands of sayings of His which have not come down to us (*John* xxi, 25); they had the Apostles amongst them, and had not the divine teaching on hearsay. "And the multitude of them that believed were of one heart and soul: and not one of them

* This Communism was voluntary. "Whiles it remained, was it not thine own?" (*Acts* v, 4.) They shared out of their own free will, because they felt that it was the right, Christian thing to do; and this makes it more significant than if it had been forced upon them.

said that aught of the things which he possessed was his own ; but they had all things common " (*Acts* iv, 32, R.V.) And as a natural result of this Communism (as St. Chrysostom reminded his hearers many years afterwards) "great grace was upon them all. For neither was there among them any that lacked : for as many as were possessors of land or houses sold them, and brought the prices of the things that were sold, and laid them at the apostles' feet : and distribution was made unto each according as anyone had need " (*Acts* iv, 33-5, R.V.). From each according to his ability, to each according to his need !

Thus we have reached from the first proclamation of a levelling revolution to the establishment of a deliberate voluntary communism co-extensive with the first Church.

My task is nearly done. I have only now to point out that this Church is still pledged to Christian Socialism, not only by her first documents, but by her history. The communist experiment at Jerusalem failed, which was significant as showing how intense was the conviction of those who tried it so long before the time was ripe. But the Church did not give up the Socialist ideal for that.* If it had, then Christ, who promised to be with it even to the end of the world, would have been wrong. There have, indeed, been plenty of bad bishops, and bad priests and people, and periods of corruption and recovery ; but, all along, the heaven has been working, and the Kingdom growing nearer and clearer—aye, even amid the deluge of modern avarice. Nor can anyone who has studied the slow processes of evolution in man and nature approve for one moment the ignorant objection that nineteen hundred years is a long time to have taken. It is a short period in the world's history. And all along the corporate Church, as distinguished from individuals, has consistently maintained the same ideal. A form of Communism, confined to religious orders because it could not be practised in the world, has never ceased to flourish ; it has always been held up as an ideal life, and whenever people wanted to be particularly good they have, as a matter of course, lived a communal life, following Christ's advice : "If thou wilt be perfect go and sell that thou hast and give to the poor " (*Matt.* xix, 21). At the present day hundreds of thousands of Christians are so living.

It was the Church in early days, as the Bishop of Birmingham has shown,† that invented representative government. The Church also steadily condemned *all* receiving of interest on capital down to

* Note for instance how Tertullian (200 A.D.) appeals to the Socialism of the Church as a thing which can be taken for granted, and which excites the wrath of the pagan world :—"And they [the pagans] are angry with us for calling each other brethren. . . . The very thing which commonly puts an end to brotherhood among you [pagans], viz., family property, is just *that* upon the community of which *our* brotherhood depends. And so we, who are one in mind and soul, have no hesitation about sharing our possessions with each other." Tertullian, *Apol.*, 39.

† Bishop C. Gore, *The Mission of the Church*, p. 143 ; *The Church and the Ministry*, pp. 97-107.

the 16th Century, and canon law still bears witness to this in theory.* All those whom the Church delights to honor, the Fathers and the Saints, from St. Matthew to the author of the *Utopia*, have practised and preached some form or other of what we now call Christian Socialism†.

In her sacraments she has constantly proclaimed the sacredness of common earthly things; in Baptism she asserts the absolute right of every human being, however young, or poor, or ignorant, to her brotherhood. Indeed, St. Paul, in his splendid comparison of the brotherhood (1 *Cor.* xii) to the one body with many members, wherein if one member suffer all the members suffer with it, bases his whole contention upon this sacrament of Baptism.‡

In the Holy Communion she has maintained the communal character of the highest form of worship; for, as the *Didachè* says, "if you are sharers in the imperishable things [*i.e.*, communicants], how much more must you be sharers [communists] in those things that are perishable"; "therefore thou shalt not turn away from him that hath need, but shalt share all things with thy brother, and shalt not say that anything is thine own."§ This is just what so shocked people when Mr. Stewart Headlam said that those who come to Holy Communion must be holy communists.

By her very existence the Church declares the solidarity of the human race, and its essential unity, free from all distinction of class, sex, or race, "neither Jew nor Greek, bond nor free, male nor female, for ye are all one man in Christ Jesus," as St. Paul insists in three separate epistles (*Gal.* iii, 28; *Col.* iii, 11; 1 *Cor.* xii, 13).

Much of all this has been forgotten, since Christians have devoted all their energies to breaking up the Church into competitive sects, and fighting with each other, and have made an apotheosis of selfish individualism by the Calvinistic heresies of justification by faith without works, the impossibility of falling from grace, and the still more hideous doctrine of predestination. I simply ask Christians of all kinds to be true to their common mother, the historic Church,

* Two economic doctrines were not only preached, but enforced by the Church courts and accepted by all business men down to the age of the Reformation. One of these was the prohibition of interest. The other was the doctrine of the "just price," which said that a man was not to ask what he could get for a thing, but was to demand only the just price, *viz.*, what it ought to fetch in order to enable the maker of it to lead a decent life according to a recognized standard. These were not mere pious opinions, but were principles universally practised; and thus for 1,500 years the "selfish machine" of modern economics was not allowed to exist. See Professor Ashley's *Economic History*, vol. i, chap. 3, and ii, 6.

† Many of the sayings of modern Socialists are indeed but echoes of what is to be found in the Fathers. For instance, Proudhon's famous saying that "Property is Robbery" was anticipated 1,600 years ago by St. Ambrose: "Nature therefore created common right, Usurpation made private right" (*De Off.* i, 28). See note on page 16.

‡ "For in one Spirit were we all baptised into one body, whether Jews or Greeks, whether bond or free" (1 *Cor.* xii, 13, R.V.).

§ *Didachè*, or, "Teaching of the Twelve Apostles," iv, 8. This very important work (which was not discovered till 1883) belongs probably to the 2nd or 3rd Century; but the sentence here quoted was taken from the Epistle of Barnabas (cxix, 8), which is earlier.

and not be misled by those who have overlaid her teaching with their own selfishness. And to those who are not conscious Socialists I say, Why not? Have you any reason except a selfish one? Why hold back and be half-hearted? You and we are at one. For Christianity is not Individualism. Neither is it Socialism and water. It is Socialism and fire—the practical religion of those whose inspiration is “comfort, life, and fire of love.”*

And to those Socialists who are not consciously Christian, I also say, Why not? You are serving Christ. You and we are at one. We are fighting against the same evils. Look at our devotional books, and you will find at the beginning the ancient tabulated lists of virtues and vices. You will see that we love the same things that you love, Justice, Love, Hope, Fortitude; that we are commanded to do the same “Corporal Works,” to feed, give drink, and clothe. Nay, that we have to fight the same things. There are four “Sins crying to Heaven for Vengeance”; only four, but two of these are Murder and the Sin of Sodom, and the other two are Oppression of the poor and Defrauding the laborers of their wages. You will find, moreover, “Seven Deadly Sins” which you will see at once are just the anti-social sins which you are fighting—Pride, Covetousness, Lust, Anger, Gluttony, Envy, Sloth; and you will observe that, with one exception, none of these seven shock the respectable public, though Socialism does. You will further observe that four of these sins—Pride, Covetousness, Envy and Sloth, and often Gluttony as well—are popularly regarded as very gentleman-like qualities.

Will you, then, realize—and it is time you did!—that what you and every good man are fighting, is nothing else than wickedness, and none the less wickedness because it is embodied in statute-books and economic formulæ? Beneath all your political work you have to convert the heart of man. And it is a tough job. You won't convert him by pointing to his interests. He is singularly blind about them, and always has been. You will only convert him by giving him a moral ideal. Is there a better one than Christ? If so, how is it that Socialism can only be spread in those countries where the people have professed the Christian faith for many hundreds of years? The Church has made plenty of mistakes, and its members have committed ruinous sins like other people, and always there have been many Judases within the camp selling the Christ for pieces of silver; but its united voice, its official documents, its pattern saints have never faltered; and at least it has driven into men's hard hearts some touch of brotherly love, and has made Socialism already almost possible in Christian countries.

This Socialism is its own old teaching revived. It is getting to understand that; and the age of social lethargy and religious competition is passing away. Every Socialist who understands how deeply religion has been concerned in every movement that has ever won the enthusiasm of men, every Socialist who realizes how

* The *Veni Creator* in the Prayer Book translation.

enormous is the work before him, must welcome the assistance of this ancient and imperishable organ of love and justice. And every Christian who rejoices in the singular growth of religious zeal in recent years must long to see all that huge force given to the service of the Humanity which Jesus Christ has taken up into the Godhead.

For the man that loves much is a Socialist, and the man that loves most is a Saint, and every man that truly loves the brotherhood is in a state of salvation.

We know that we have passed from death unto life,
Because we love the brethren.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

FABIAN ESSAYS IN SOCIALISM. Paper 6d.; cloth 1/6; post. 2½d. and 4d.

WHAT TO READ on Social and Economic Subjects. Fifth edition, revised to October, 1910, and enlarged. Interleaved, paper, 1s. n. cloth 2s. n., post. 2d.

THIS MISERY OF BOOTS. By H. G. WELLS. 3d., post free 4d.

FABIAN TRACTS and LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 81, 3s.; post free 3/5. Bound in Buckram, 4/6 n.; post free 5s.

SMALL HOLDINGS, ALLOTMENTS, AND COMMON PASTURES:

And How to Get Them by the Act of 1907.

WHAT is the use of an allotment to a working man? It has many uses. In the first place, if he puts good labor into it, and if he keeps a pig to eat some of the produce and to supply manure, an acre allotment is worth three or four shillings a week to him, and often more.

Secondly, he is always sure of having a good supply of vegetables and potatoes for his family.

When he is out of work, too, he can spend some of the time that would otherwise be wasted, in improving his own piece of land.

Allotments make the laborers more independent when they have to deal with the farmers and landlords. Undoubtedly one of the chief things needed at the present time is an independent and sturdy spirit amongst the farm laborers. In our midland and southern villages they suffer constantly from low wages and harsh treatment, but the majority of them dare not say a single outspoken word to help to make things better. They take whatever wages are offered them and they put up with every tyranny without protest. Why is this? Chiefly because they depend on others for work and food, and seldom have any Trade Union to look after their interests. But if a laborer has a sack or two of flour in his cottage, and a couple of good sides of bacon, and a stock of potatoes to tide him over the winter, he does not feel nearly so helpless and humble. And an allotment can provide him with these things.

How to make an Allotment Profitable.

But allotments are not found to succeed everywhere and always. Certain things are necessary before they are likely to be of real use. The allotment must be

NEAR THE LABORER'S OWN HOME.

It is absurd to expect a man to walk out a mile or so and walk back again, after he has done a heavy day's work, in order to spend an hour on his allotment. And as an allotment always requires constant care and attention if it is to give the best results, it is absolutely necessary that it should be near the worker's home.

A FAIR RENT.

Often the laborers grow such good crops on their allotments and make them pay so well that the landlord takes the opportunity to charge them a much higher rent than he asks the farmer for the neighboring land of the same quality. Why should working men

pay a penalty for cultivating their land well? And why should they work hard and constantly in order that the landlord may get an extra rent? The rent must certainly be a fair one.

Small Holdings.

It is not only the laborer who finds it profitable to work a plot of land if he can get it at a fair rent and on reasonable conditions. Working as he does chiefly in his spare time, the allotment is large enough for his needs. But there is an increasing demand for land for another class of agriculturists, the men who wish to devote their whole time to a farm, the men who want a small holding up to fifty acres. Here, again, it is not always possible to bargain with the landlords for suitable farms at a fair price or on fair terms that will protect the tenant against loss of his improvements at the end of the tenancy.

Common Pasture.

There is another kind of land which is urgently needed by both laborers and small holders. In the olden days, before Englishmen allowed their land to be seized by a few landlords under the Enclosure Acts, there were many large commons, whereon the villagers had the right to feed their cattle and pigs. Many a cottager or small farmer would more easily be able to keep his cows, or his horse, or pigs, if he had a right to use ample common pasture. It is the loss of the old rights of grazing animals and gathering fuel on the common lands of the village which has done so much to put the people at the mercy of the landlords.

How to Get Allotments, Small Holdings, and Common Pasture.

Now the law of England says that it is the duty of local government councils to provide all these things—allotments, small holdings, and common pastures—if the people desire them, and cannot otherwise obtain them from the landlords on reasonable terms.

ALLOTMENTS.

In the case of allotments it is the business of the Borough Council, the Urban District Council, or the Parish Council (or the Parish Meeting in parishes where there is no Parish Council) to find the land for those who wish to work it. These Councils may purchase or hire land either by a voluntary agreement with the landlord or, if he refuses to come to reasonable terms, the Council can ask the Board of Agriculture to make an order compelling the landlord to accept the terms, which are to be settled by an arbitrator appointed by the Board; and this arbitrator must not add to the price because of the compulsion. However, if the land is only to be leased, then the lease must be for not less than fourteen or for more than thirty-five years; but this term can be renewed at the will of the Council. In the case of a Parish, the Council or Meeting, instead of proceeding itself, must ask the County Council to apply for the compulsory order; it hands over the land, when acquired, to the Parish, which must pay all expenses. If the County Council will not move, the Parish can appeal to the Board direct.

Having acquired the land, the Council can adapt it for use (by draining, fencing, road making, erecting buildings, including a dwelling house if accompanied by one acre), and let it out in allotments not exceeding five acres to any one of the laboring population, or to a group of persons working as a co-operative colony, or to an association for the promotion of allotments. The rent must be sufficient to repay all the money that the Council has spent on the land, so that no charge shall ultimately fall on the rates ; but a Council may levy a rate or raise a loan to meet the expenses in the first instance. So long as it repays the expenses, the Council can let as cheaply and on as favorable terms as it pleases. And the tenant in every case can remove any fruit trees or bushes to which he has no claim for compensation on giving up the tenancy.

If a Council neglect to consider these matters, any six registered parliamentary electors or resident ratepayers can request (in writing) the Council to discuss the need of the neighborhood. Although these petitioners cannot force the Council to return a favorable answer to a request for land, this petition is a useful step to take, as it forces the Council to state its intentions.

If the Councils mentioned above refuse to take action in providing allotments, then it becomes the duty of the County Council to consider the situation (except in the case of a borough), and if it resolves that there is really need for allotments, then it (the County Council) at once takes over all the allotment powers of the Council which has neglected to take action. The County Council can acquire the allotments, and charge all the expenses on the defaulting Council.

If the County Council also neglects its duty, the Board of Agriculture can transfer all the above powers of a County Council to the Small Holdings Commissioners, who can then take all the steps which the County Council might have taken.

SMALL HOLDINGS.

It is the business of the County Council to find out whether there is a demand for small holdings ; and it can acquire land for this purpose in practically the same manner as land can be acquired for allotments as stated above. That is, it can acquire it by purchase or by hiring, by compulsion if necessary, and can adapt the land for use as small holdings. The chief difference is that it can let or sell the land in plots of any size between one and fifty acres, or more than fifty acres if the annual value is not more than £50 as assessed for income tax. Further, the Council must not charge the county rates in any year with more than one penny in the pound on account of any expenses incurred for small holdings, including the annual repayments of any loans raised for such a purpose. If the holder desires to purchase his holding he can do so by half-yearly instalments over a period, agreed on by the Council, not exceeding fifty years.

And if the County Council will not proceed to supply small holdings then the Board of Agriculture (as in the case of allotments) can instruct the Small Holdings Commissioners to acquire the land and charge all expenses on the County Council.

COMMON PASTURE.

This can be acquired by any Council which is empowered to acquire allotments and small holdings, and can be rented out to tenants or any laborers in the form of grazing rights. But it is necessary to get the sanction of the County Council before any other Council can take action in this way.

Co-operation.

But the County Council can do much more than provide the land necessary for allotments and small holdings and common pasture. The experience of successful farming shows most clearly that one of the great secrets of success is the co-operation of farmers for the purposes of buying their implements and manure, etc., of turning their milk into butter, and of sending their produce to market in the cheapest way. English farmers are very far behind the rest of the world in this respect; nevertheless they have begun to move slowly, and co-operative societies are growing in number. A County Council or the Board of Agriculture can make grants or loans of money for the promotion of co-operation between small holders or allotment workers.

What all these Powers Mean.

Simply this: that if the people elect the right men to the local Councils they can get allotments and small holdings on the best terms and ready for immediate use. The Councils can, further, by forming co-operative societies, help the tenants to buy and sell to much greater advantage than if each worker of land had to buy what he wants and to sell his produce on his own account. If the people of England want allotments and small holdings they can have them at once if they use their voting power on polling days.

And remember, if the local Councils refuse to find the land that is wanted, then the Government can force the Councils to act, or can buy the land itself. The Government has already appointed two Commissioners to inquire into the demand for land throughout England and Wales. The truth is the people can force the Government to do whatever they wish if they send the right men to Parliament, and the easiest way to get the Government to attend is to write to your Member of Parliament. But if the voters put men on the Parish, Urban and County Councils, or in Parliament, simply because of their wealth and position and without their having shown genuine good-will towards the people, they are certain not to get what they want. The working men can elect anyone they choose, for they are in the majority. Let them, therefore, make up their minds firmly beforehand whom they wish to have as Councillors, and, when the election comes, let them support their candidates loyally through thick and thin.

THE VILLAGE AND THE LANDLORD.

(Reprinted by permission from the *Albany Review*, April 1907.)

My object in this paper is simply to describe the economic conditions of a single country parish, here in England, and from the consideration of these conditions to draw some inferences towards our future policy with regard to the land. In modern life—in every department of it, one may say—bedrock facts are so veiled over by complex and adventitious growths that it is difficult to see the proper and original outline of any problem with which we are dealing; and so it certainly is in this matter of the land question. Anyone glancing at a country village, say in the neighborhood of London, probably sees a mass of villas, people hurrying to a railway station, motor cars, and so forth; but as to where the agricultural workers are, what they are doing, how they live, what their relations may be to the land and the land owners—these things are obscure, not easily seen, and difficult to get information about. And yet these are the things, one may say, which are most vital, most important.

The parish which I have in mind to describe is a rather large and straggling parish in a rural district, with a small population, some 500 souls, almost entirely agricultural in character, consisting of farmers, farm laborers, woodmen, and so forth, with a few miners and small artisans—on the whole a pretty hard-working, industrious lot. Fortunately, one may say, there is hardly anything resembling a villa in the whole parish; there is no resident squire, and the business man is conspicuous by his absence. The place therefore forms a good example for the study of the agricultural land question. The farms are not over large, being mostly between fifty and one hundred acres in extent. There is just the land, and the population living mainly by the cultivation of it. This population, as I have hinted, is not lacking in industry; it is fairly healthy and well grown; there is no severe poverty; and (probably owing to the absence of the parasite classes) it is better off than most of our agricultural populations. Yet it is poor, one may almost say very poor. Probably, of the hundred families in the parish, the *average* income is not much over £60 a year; and many, of course, can by no means reach even that standard.

Financial Conditions of the Village.

Let us consider some of the financial and other conditions which lead to this state of affairs. In the first place, I find that the inhabitants have to pay in actual rent to their landlords about £2,500 a year. In fact, the gross estimated rental of the parish is about £3,250, but as there are quite a few small freeholders the amount actually paid in rent is reduced to £2,500. Nearly the whole of this goes off out of the parish and never comes back again. The duke and most of the other landlords are absentees. This forms at once, as is obvious, a severe tax on the inhabitants. One way or another the hundred families out of what they produce from the land have to pay £2,500 a year into alien hands—or, averaging it, £25 per family! and this, if their average income is now only £60, is certainly a heavy burden; since, if they had not to pay this sum, their income might be £85. No doubt it will be said, "Here we see the advantage of having resident squires. The money would then return to the parish." But would it? Would it return to those who produced it? No; it would not. The spoliation of the toilers would only be disguised, not remedied. In fact, let us suppose (a quite ordinary case) that the parish in question were owned by a single resident squire, and that the £2,500 were paid to him in rent. That rent would only go to support a small extra population of servants and dependents in the place. One or two small shops might be opened; but to the farmer and farm worker no advantage would accrue. There might be a slightly increased sale of milk and eggs; but this again would be countervailed by many disadvantages. "Sport" over all the farm lands would become a chronic nuisance; the standard and cost of living, dress, etc., would be raised; and the feeble and idiotic life of the "gentry," combined with their efforts to patronize and intimidate, would go far to corrupt the population generally. In this parish then, of which I am speaking, the people may be truly thankful that they have not any resident squires. All the same, the tax of £25 per family is levied upon them to support such squires in some place or other, and is a permanent burden upon their lives.

Enclosure of the Commons.

Less than a hundred years ago there were in this parish extensive common lands. In fact, of the 4,600 acres of which the parish consists, 2,650, or considerably more than half, were commons. They were chiefly moors and woods; but were, needless to say, very valuable to cottagers and small farmers. Here was pasture for horses, cows, sheep, pigs, geese; here in the woods was firewood to be got, and bracken for bedding; on the moors, rabbits, bilberries, turf for fuel, etc. In 1820 these commons were enclosed; and this is another thing that has helped to cripple the lives of the inhabitants. As is well known, during all that period systematic enclosure of the common lands of Great Britain was going on. In a landlord House of Parliament it was easy enough to get bills passed. Any stick will do to beat a dog with; and it was easy to say that

these lands, being common lands, were not so well cultivated as they might be, and that *therefore* the existing landlords ought to share them up. The logic might not be very convincing, but it served its purpose. The landlords appropriated the common lands; and during the 120 years from 1760 to 1880, *ten millions of acres* in Great Britain were thus enclosed.*

In 1820 the turn of this particular parish came, and its 2,650 acres of commons "went in." I used to know an old man of the locality who remembered when they "went in." He used to speak of the occurrence as one might speak of a sinister and fatal event of nature—a landslide or an earthquake. There was no idea that it could have been prevented. The commons simply went in! The country folk witnessed the proceeding with dismay; but, terrorized by their landlords, and with no voice in Parliament, they were helpless.

It may be interesting to see some of the details of the operation. In the Enclosure Award Book, still kept in the parish, there remains a full account. The Duke of Rutland, as lord of the manor, as impropiator for tithes, as proprietor, and so forth, got the lion's share, nearly 2,000 acres. The remaining 650 acres went to the other landlords. Certain manorial and tithe rights were remitted as a kind of compensation, and the thing was done. In the Award Book the duke's share is given as follows:—

	Acres.	Roods.
1. "As Impropiator for tithes of corn, grain, and hay; and in lieu of and full compensation for all manner of tithes, both great and small"	1381	3
2. "As Lord of the Manor," and in compensation for certain manorial rights, "and for his consent to the said enclosure" ...	108	2
3. "For chief rents," amounting in the whole to £14	28	2
4. "For enfranchisement of copyholds" ...	11	3
5. "As proprietor"	18	2
6. "By sale to defray the expenses of the Act"	449	1
	<hr/>	
	1998	1

Thus we find, in exchange for the ducal tithes, nearly a third of the whole area of the parish handed over—most of it certainly not the best lands, but lands having considerable value as woods and moors. We find some acres adjudged to the duke in consideration of his kind "consent" to the transaction. And, most wonderful of all, nearly 450 acres surrendered by the parish to defray the expenses of getting the Act through Parliament! And now to-day in the said parish there is not a little field or corner left—absolutely not a solitary acre out of all the vast domain which was once for the people's use—on which the village boys can play their game of cricket! Indeed, most valuable tracts were enclosed quite in the

* See Mulhall's *Dictionary of Statistics*, "Enclosures."

centre of the village itself—as, for instance, a piece which is still called “The Common,” though it is no longer common, and many bits on which little cottages had been erected by quite small folk. It would be a very desirable thing that the enclosure award books in other parishes should be investigated, and the corresponding facts with regard to the ancient commons brought to light generally over the country.*

Incidence of the Rates.

A third thing which cripples the agricultural interest very considerably is the incidence of the rates. The farmer's dread of a rise in rates has become almost proverbial. And it is by no means unnatural or unreasonable. For there is probably no class whose estimated rental is so large, compared with their actual net income, as the farmer class. A farmer whose farm, after deducting all expenses of rent, rates, manure, wages, etc., yields him a clear profit of no more than £100 a year for his household use is quite probably paying £70 a year in rent. But a superior artizan or small professional man who is making £150 a year will very likely be only paying £20 in rent. It is obvious that any slight increase in the rates will fall much more heavily on the first man than on the second. The rates, therefore, are a serious matter to the farmer ; and something in the way of shifting their incidence, and distributing the burden more fairly, ought certainly to be done.†

As an instance of this latter point, let me again refer to the parish in question. We have seen that some 2,600 acres of common lands passed over to the landlords in 1820, ostensibly for the public advantage and benefit. Of these, more than 1,500 acres of moor land, held by the duke, are rated on an estimated rental of less than 2s. 6d. per acre. The general farm lands of the parish are rated on an estimated rental of 14s. or 15s. per acre on the average. Thus the moor lands are assessed at about one-sixth of the value of the farm lands. This is perhaps excessively low ; but the matter might pass, if it were not for a somewhat strange fact—namely, that a few years ago when some twenty acres of these very moor lands were wanted for a matter of great public advantage and benefit, that is, for the formation of a reservoir, the ducal estate could not part with them under £50 an acre ; and a little later, when an extension of acreage was required, the district council had to pay a much higher price, so that the total purchase, first and last, comes out at more than £150 per acre ! Now here is something very seriously out of joint. Either the moor lands are worth a capital value of £150 an acre, in which case they ought to be assessed at, say £5, instead of at 2s. 6d. ; or else, if the rating at 2s. 6d. is really just and fair,

* *Some Forgotten Facts in the History of Sheffield and District* (Independent Press, Sheffield, 1907, price 2s. 6d.) contains valuable information of this kind.

† I am not here discussing the question of how far a rise of rates falls upon the landlord ; for, though this may ultimately and in the far distance be so, it is clear that the farmer primarily feels the pinch, and not till he is nearly ruined is there any chance of his getting a corresponding abatement of rent.

surely it is monstrous that the public, having to carry through a most important and necessary improvement, should be "held up" and made to pay a ruinous price, simply because the land cannot be obtained elsewhere. The conclusion is: Let such lands be rated in accordance with the capital value set upon them by their owners, and we shall have a much fairer and more equitable distribution of the public burden.

The Nuisance of "Sport."

And this matter of the moors leads to the consideration of a fourth cause which cripples the land cultivator terribly in this country. I mean Sport. The nuisance and detriment that this is to the farmer has become so great that, unless strict measures are soon taken, widespread ruin will ensue. In many subtle ways this acts. With the enormous growth of wealthy and luxurious classes during the last fifty years, the tendency has been to turn the country districts into a mere playground. The very meaning of the word sport has changed. The careful working of covers by the occasional sportsman has been replaced by clumsy battues, with wild shouts and shrieks of "drivers," and huge slaughter of birds, half tame, and specially bred for the purpose. Mobs of people, anxious to appear fashionable, and rigged out by their tailors in befitting costume, are formed into shooting parties. Rich men, wanting to get into society, hire moors and woods, regardless of expense, regardless of animal slaughter, regardless of agricultural interests, as long as they get an opportunity to invite their friends.* In Devonshire to-day the farms in many parts are simply eaten up by rabbits, because the landlords, in order to provide plenty of shooting, insist on spinneys and copses and hedgerows and waste bits being retained in their wild state for purposes of cover! On the northern moors the rabbits similarly devastate the farms along the moor edges—not because the rabbits are preserved, for the shooting is mainly of grouse and pheasants, but because the moors, being uncared for except in this way, the rabbits are allowed to multiply without check. They are the gamekeeper's perquisite. Yet if the farmer who has a farm adjoining the moor carries a gun to protect himself against their invasions, it is conveyed to him (if a tenant of the same landlord) that he had better not do so, lest he should be suspected of shooting the grouse! Thus he is paralysed from his own defence. In the parish of which I am speaking there are lands along the moor edges which used to grow oats and other crops, but which now, on account of the rabbit nuisance, are quite uncultivable in that way, and only yield the barest pasture.

* The financing of these affairs is funny. A large moor will let for the grouse season for £3,000, say on the condition of grouse being bagged up to, but not beyond, 2,400 brace. Mid-week parties hurry in by rail and motor, stay for two or, perhaps, three nights, and hurry off again, to be succeeded by other parties the following weeks. The whole thing is conducted in the most mechanical way, with "drives," "batteries," and so forth. And when the expenses are added up, including men employed, guests entertained, and rent paid, they certainly do not fall far short of the proverbial guinea a bird!

Fifty Years of Agricultural Decay.

In and about 1850, when wheat more than once reached £5 a quarter, the farmers and landlords were doing a roaring trade. Rents were high, but the land could afford it. Farmers were anxious to increase the size of their holdings, and landlords were not averse to this, as it saved them trouble. And so set in that tendency to roll small holdings into big ones which continued, with baneful effect, during all the second half of the century. Sport at the same time came in to increase the action. It was easier to pacify the few than the many over that matter. It was simpler to hunt a pack of hounds over two or three large farms than across a network of small holdings. Besides, the New Rich, as well as the elder gentry, wanted widespread parks, and not a democratic rabble of cottagers at their very doors. And so the game went on. Soon prices of farmstuff fell heavily. But it is easier to get rents up than to get them down again. The alleviations of rent which *have* taken place since 1854 have been only painfully gained and grudgingly yielded. Wheat which was at 100 shillings a quarter then has been the last few years at about 30 shillings! And though other farmstuffs have not fallen in like degree, yet during all that period of declining prices, the British farmer has been pinched and pined all over the country. The landlord has been on top of him; and with holdings often much too large for his need, and a yearly balance too small, he has employed far less labor and tillage than he ought to have done; his land has lost heart; and he has lost heart—till he has become to-day probably the least enterprising and least up-to-date of all the agriculturists of Western Europe.*

Such are some at least of the causes which have contributed to the decay of agriculture in this country; and their consideration may indicate the directions in which to seek for a cure.

Security of Tenure Needed.

What is needed, first and foremost, is very obviously security of tenure, under such conditions as shall give both farmer and cottager a powerful interest in the land and its improvement. It is often said, and supposed, that the countryman now-a-days does not care about the land and the rural life, and is longing to exchange it for town life. I do not find this so. I find that he is compelled into town life by the hard conditions which prevail in the country—but not that he *wants* to leave the latter. Indeed, I am amazed at the tenacity with which he clings to the land, despite the long hours and the heavy toil; nor can one witness without wonder and admiration the really genuine interest which he feels in its proper treatment, quite apart from any advantage or disadvantage to himself. It is common to find a farm laborer expressing satisfaction or disgust at the good or bad tillage of a field with which he is in no way connected; or to see a small farmer's son working early and late, perhaps up to the age of thirty, with no wages but a mere pittance

* There are many farms of 500 or 600 acres in Gloucestershire only employing five or six hands—or one man to a hundred acres!

in the way of pocket-money, and only a remote prospect of inheriting at some future date his share of the farm-stock and savings, and yet taking a whole-hearted interest in the work not really different from that which an artist may feel. There is some splendid material here—in these classes neglected by the nation, and overlaid by a tawdry and cheap-jack civilization.

I say it is clear that they must be given a secure and liberal tenure of the land and be free once for all from the caprice of the private landlord with his insolences of political intimidation and sport, and his overbearance in parochial affairs. The absolute speechlessness of our rural workers to-day on all matters of public interest is clearly, to any one who knows them, due to their mortal dread lest their words should reach the powers above. It has become an ingrained habit. And it has led of course to a real paralysis of their thinking capacity and their enterprise. But place these men in a position where the fruits of their toil will be secure, where improvements can be made, in cottage or farm, with a sense of ownership, and where their vote and voice in the councils of the parish will not be dependent on squire or parson ; and the world will be astonished at the result.

Public Ownership.

There are two main directions in which to go in the matter of secure tenure. One is the creation of more small freeholds ; the other is the throwing of lands into the hands of public authorities, and the creation of permanent tenures under them. Though the latter embodies the best general principle, I do not think that forms a reason for ruling out freeholds *altogether*. In all these matters variety is better than uniformity ; and a certain number of freeholds would probably be desirable. In the same way with regard to public ownership, if anything like nationalization of the land is effected, I think it should decidedly be on the same principle of variety—creating not only State and municipal ownership, but ownership by county councils, district councils, parish councils, etc.—with a leaning perhaps towards the more *local* authorities, because the needs of particular lands and the folk occupying them are likely on the whole to be better understood and allowed for in the locality than from a distance.

Let us suppose, in the parish which I have taken for my text, that by some kind of political miracle, all the lands on which rents are now being paid to absent landlords were transferred to the ownership of the Parish Council. Then at once the latter body would come into an income of £2,500 a year. At one blow the whole burden of the rates would fall off, and still a large balance be left for public works and improvements of all kinds. It might be allowable, for a moment, to draw a picture of the utopian conditions which would ensue—the rates all paid, the rents milder and more equal than before, the wages of parish workers raised, free meals for school-children provided, capital available for public buildings, free libraries, agricultural engines and machinery, also for improving or administer-

ing common lands and woods, and so forth. There is no danger of course of so delirious an embarrassment actually occurring! for any scheme of nationalization would take a long time, and would only gradually culminate; and no scheme would place the whole lands of a parish at the disposal of a single body like the parish council. But the example helps us to realize the situation. Every farmer and cottager whose holding was under a public body would know and feel that whatever rent he might have to pay, it would come back to him in public advantages, in the ordaining of which he would have a voice; he would know that he would be in no danger of disturbance as long as he paid his rent; and in the matter of capital improvements in land or building he might either make them himself (with the council's consent), in which case if he should decide later on to quit the holding, the council would compensate him, knowing that the rental paid by the new tenant would be correspondingly increased; or he could get the council (if willing) to make the improvement, and himself pay a correspondingly increased rent for it. In either case he would have as good a bargain, and almost as free a hand, as if he were on his own freehold.

Small Holdings.

Security of tenure, largely through public ownership, must certainly be one of the first items of a land-reform program. Another item, the importance of which is now being widely felt, is the making provision for the effective supply of small holdings. Whether the present Small Holdings and Allotments Act (of 1907) *will* prove effective or not remains to be seen. But something effective in that direction must clearly be done. By small holdings I mean holdings, freehold or leasehold, from twenty-five acres down to one or two acres in extent, each with cottage and buildings attached.* Of this class of holding (largely owing to the "rolling up" policy of last century) there is an absolute famine in the land. The demand, the outcry, for them is great, but the supply is most scanty. Yet this class covers some of the most important work of modern agriculture, and a great variety of such work. It includes, in its smaller sizes, market gardens, with intensive culture of all kinds, and glass, besides the kind of holding occupied by the professional man or other worker who supplements his income by some small cultivation; and in its larger sizes it includes nurseries, as well as small arable and pasture farms. The starvation that exists to-day in Britain of all these classes of industry is a serious matter.†

* The Act of 1907 defines a "small holding" as exceeding one acre and not exceeding fifty acres.

† It will be said that if there is such a demand for small holdings, the supply will soon by natural laws be forthcoming. But as a matter of fact under our present system this is not so—and for three reasons: (1) The slowness of the landed classes to perceive the needs of the day—even though to their own interest; (2) The want of capital among a great number of them, which makes them unwilling to face the breaking up of large farms and the building of extra cottages; (3) The fact that those who have money are careless about public needs, and do not *want* to see a sturdy population of small holders about their doors.

In the parish with which we are dealing, owing partly to its distance from a market, the demand for such holdings takes chiefly the form of a demand for small arable and pasture farms. But the need of these is great, as indeed it is nearly all over the country. A holding of this kind, of any size from five to twenty acres, forms an excellent stepping-stone for a farm laborer or farmer's son towards a position of independence. A second or third son of a farmer, not likely to follow his father in the occupation of the farm, has to-day only a poor prospect. Unable to command enough capital to stock a large farm himself, and unable to find a small one, he has but two alternatives—to drift down into the fruitless life of the farm laborer, or else to go off and try his luck in town. If, as is most often the case, he is twenty-five or so before the need of making a decision comes upon him, his chances of learning a town trade are closed, and the first alternative is all that is left. Yet the small holder of this kind is often one of the most effective and useful types of agricultural worker. On a holding, say of fifteen acres, while he cannot get an adequate living for himself and family by ordinary farm methods, yet he can gain a considerable amount, which he supplements by working as a useful hand for neighbors at harvest and other times. Being thrown on his resources, and not having *too* much land, he gains more than the average out of it, and his own ingenuities and capacities are developed ; so that, as a rule, he is the most resourceful and capable type of man in the district. It is of the most vital importance to the country that this type of man, and his class of holding, should be encouraged.

Agricultural Co-operation.

There is one method which I have so far neglected to mention by which both security of tenure and small holdings can be obtained—I mean Co-operation. The formation of co-operative societies for the purchase of large farms, for the division of them, the building of cottages, and the leasing of small holdings so obtained, is one of the most hopeful directions for the future. It ought to be easy for the public authorities to lend money on perfectly safe terms for this purpose. What co-operation has done and is doing for agriculture in other countries—in the way of establishing banks, land-holding societies, societies for butter-making, egg-collecting, buying of feeding stuffs and manures, sale of produce, etc., is now perfectly well known. Ireland even has left England behind in this matter ; but England and Scotland will have to level up. It is a sign, at least of good intentions, that the late Act gives power to the County Councils to promote and assist the formation and working of co-operative agricultural societies of all kinds.

Re-transfer of Old Common Lands and Declaration of Land Values.

One of the very first things, I think, which ought to be taken up is this question of the commons. If ten million acres between 1760 and 1880 passed so easily from the public use into the exclusive

hands of the land owners, surely there ought not to be much difficulty in passing them back again. As I have said, they were appropriated mainly on the plea that, being commons, they were inadequately cultivated. The main cultivation they have received from the landlords has been of rabbits, grouse, and other game! The public has been simply played with in the matter; and agricultural interests, instead of being extended and improved, have been severely damaged. When we realize, in addition to this, that, owing to the increase of the general population and its needs, these tracts which passed into private hands with such slender compensation to the public, are now held up at ruinous prices, we realize that it is high time that the game should cease; and that the lands which Parliament voted away from the public in those days should now be voted back again—and with “compensation” on a similar scale. These lands are still largely in the hands of the families to whom they were awarded; and the transfer could perhaps be most fairly and reasonably effected by their simple reversion to the public on the expiration of existing life interests in them. But of course there would have to be land courts to deal with and compensate special cases, as where the land had changed hands, and so forth.

The value of such ancient common lands to the public would now be very great. Large portions of them would be suitable for cultivation and for allocation in small holdings; the villages would again have a chance of public playgrounds and cricket grounds; the Parish councils would have lands (so much needed and so difficult to obtain) for allotment gardens; the District councils might turn many an old woodland into a public park; while the wilder moors and mountains could be held under County councils or the State, either for afforestation, or as reserves for the enjoyment of the public, and the preservation of certain classes of wild animals and birds, now in danger of extinction.

Let a large measure of this kind be passed retransferring the main portion of the common lands into public hands; and at the same time a measure compelling owners in the future to declare their land values, and giving power to the public bodies to purchase on the basis of the values so declared; and already we should have made two important steps towards bringing the land of the nation into the possession of its rightful owners.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. Paper cover, design by A. G. Watts. 3d., post free 4d.; 2/3 per doz., post free, 2/7.

A HISTORY OF THE ENGLISH AGRICULTURAL LABOURER.

BY

Dr. W. HASBACH,

Professor of Political Economy in the University of Kiel.

In view of the widespread interest which is now being taken in the land question, considerable importance attaches to this publication. The author traces in historical order the development of the class of agricultural labourer as it exists at the present day. The book is historical and not controversial, though the whole impression left by it is of the evil results of the development of an agricultural proletariat and of the comparative novelty of such phenomenon. The work, which was originally published in Germany, has been brought right up to date and translated into English by Miss Ruth Kenyon.

Prospectus post free on application.

P. S. KING & SON, ORCHARD HOUSE,
WESTMINSTER.

THE FABIAN SOCIALIST SERIES

consists of a revised, collected, and classified edition of some of the most valuable of the famous "Fabian Tracts" in a style more suitable for the general reading public, and supplying in a handy and attractive form the best and most authoritative thought on "What Socialism Means." Each booklet contains not less than 96 well-printed pages, good paper and good type, and is supplied in two forms, i.e., in attractive wrappers at 6d. each, nett, and in quarter cloth boards, gilt top, at 1s. each, nett. Postage 1d. and 2d. each respectively.

VOLUMES NOW READY:

- I. **SOCIALISM AND RELIGION.** CONTENTS: (1) Christian Socialism, by the Rev. Stewart D. Headlam. (2) Socialism and Christianity, by the Rev. Percy Dearmer. (3) Socialism and the Teaching of Christ, by the Rev. John Clifford. (4) A Word of Remembrance and Caution to the Rich, by John Woolman, of the Society of Friends.
- II. **SOCIALISM AND AGRICULTURE.** CONTENTS: (1) The Village and the Landlord, by Edward Carpenter. (2) State Aid to Agriculture, by T. S. Dymond. (3) The Secret of Rural Depopulation, by Lieut.-Col. D. C. Pedder. (4) The Revival of Agriculture, by the Fabian Society.
- III. **SOCIALISM AND INDIVIDUALISM.** CONTENTS: (1) The Difficulties of Individualism, by Sidney Webb. (2) The Moral Aspects of Socialism, by Sidney Ball. (3) The Impossibilities of Anarchism, by G. Bernard Shaw. (4) Public Service *versus* Private Expenditure, by Sir Oliver Lodge.
- IV. **THE BASIS AND POLICY OF SOCIALISM.** CONTENTS: (1) Facts for Socialists, by the Fabian Society. (2) Capital and Land, by the Fabian Society. (3) Socialism: True and False, by Sidney Webb. (4) Twentieth Century Politics, by Sidney Webb.

PARISH COUNCILS AND VILLAGE LIFE.

SINCE 1894 every rural parish containing more than 300 inhabitants has had a parish council to manage its local affairs. These councils are elected once every three years. There will be elections in March or April, 1910, 1913, 1916, etc. If there is not a good parish council in any parish, the electors should take care to get a good one at the next election.*

What use is the Parish Council?

Many people are saying that the parish councils are of no use to the parishes, and that they have done nothing for the poor man. It is quite true that in most places the parish councils have not done much. In many villages they have done nothing at all. But where they have done nothing at all, it is largely because the wrong men have been elected. In most parishes the farmers and shopkeepers and innkeepers do not like the parish council, because they are afraid of having to pay higher rates, and very few of the squires and parsons believe in it or care much about it.†

These people go about saying that parish councils are of no use at all to anybody. Unfortunately, many laborers and other simple folk believe this. They hoped much from the parish councils, and they have got little or nothing. But it is not true that parish councils are of no use to the poor man. They have taken the power over the village affairs out of the hands of individuals or cliques, and taught the laborer that his vote is as good as that of anyone else. In hundreds of different parishes up and down England and Wales the parish councils have done a great deal of good. They have got allotments and small holdings of grazing or gardening land for men who wanted them; they have protected the poor man's common or village green, and often obtained additional land for common pasture; they have appointed their own men to manage the village charities, and have sometimes restored to the poor charity money which had formerly been misapplied; they have seen to it that the charities should go to those who really needed them, whatever political or religious opinions they might hold; they have got better drinking water for the cottages, digging new wells and putting up new pumps where required; they have

* For a plain statement of the law about parish councils, exact particulars as to who can vote and who can be elected, and full explanation about the method of election, see Fabian Tract No. 62, "Parish and District Councils: what they are and what they can do." 1d. It will be posted to any person sending 1½d. in stamps to the Secretary, Fabian Society, 3 Clement's Inn, Strand, London, W.C.

† For this reason no proper report has been published by the Government, as was its plain duty, showing what the parish councils have done. The facts in this Tract have been gathered from more than a hundred separate reports obtained by the Fabian Society from parishes all over the country; from the printed reports and proceedings of county and rural district councils; and from various Parliamentary papers.

cleaned out filthy ponds and ditches, and done away with nuisances which were injuring the health of the village; they have maintained and repaired the footpaths, and prevented the stopping up of public rights of way; they have looked after the rates and taxes and sometimes saved the parish large sums of money by preventing dishonest officers stealing the cash or dealing unfairly with the assessments; they have put up lamps to light the village streets at night; they have procured fire engines to put out fires; they have provided open bathing places and sometimes regular baths for men and women; they have laid out playgrounds for the children, cricket fields for the young men, and pleasant walks among trees, with seats for the weary; they have erected parish halls where needed; and they have sometimes set going libraries and reading rooms for the free use of the parish. All this, and much more, has been done by the parish councils in those parishes in which the right men have been elected. This Tract is written to tell of their success. What these parishes have done, others can do.

Allotments and Small Holdings.

The Act of 1907 having at the time of writing (February, 1908), only been in force for a few weeks it is impossible to record any results from it, but it has already created a great movement in many parts of the country and thousands of acres of land have been applied for. Associations of intending small holders have been formed in many districts, such as the Land Clubs of East Surrey and West Kent, federated in the Land Club Union, particulars of which can be obtained of Montague Fordham, Honorary Organizing Secretary, Pains Hill, Limpsfield, Surrey. The Co-operative Small Holdings Association, of 10 Adelphi Terrace, London, W.C., can supply lecturers and other information as to what is being done and how to get small holdings and allotments.*

A considerable proportion of the 7,000 parish councils in existence have got land for allotments, amounting altogether to something like 17,000 acres. Most of this was acquired in the first three years after the passing of the Act of 1894; but since 1897 there has been a steady, though slower, progress in this direction. In the five years from 1897 to 1902, 219 parish councils acquired 2,580 acres for allotments, accommodating nearly 6,000 tenants; whilst five parish meetings acquired 45 acres for 77 tenants.†

In Norfolk more than 100 parishes, in Devon and in Lincolnshire more than 80, have now their own allotments under the parish council. What no one laborer could do for himself, the parish council was able to do for them all. Usually the parish council succeeded in getting enough land by agreement with the landlord, which is much the best way for all parties. Sometimes the landowners or parsons have shown themselves willing to help the parish

* See Fabian Tract No. 134, "Small Holdings, Allotments, and Common Pastures: and how to get them"; six for 1d.

† It is not yet possible to give any summarized figures for the years since 1902 because the official return, which is the only possible source of such figures, appears at somewhat rare intervals.

council, as, for example, at Shepton Beauchamp (Somerset) and at Eaglescliffe (Durham), where the good offices of the rector smoothed the way to the acquisition of some 28 acres of excellent grass land for the laborers of the village. An admirable instance of energy is afforded by the Parish Council of Belbroughton (Worcestershire). This is a village inhabited mainly by nailmakers, who, in consequence of the rapid increase of machinery, found their old industry of nailmaking by hand could no longer provide them with even the bare living wage that they had been used to make. In 1895 the parish council took a field of 18 acres and accommodated 30 nailers. The next year 16 acres were added ; the year after, 109 acres ; and, in 1903, a further 34 acres. These 177 acres enable 112 men to obtain a livelihood as market gardeners. No less than 26 horses are employed in ploughing, carting, and carrying the produce to Birmingham and bringing back manure for the land. All this, it is worthy of remark, has been done despite the lethargy of the rural district council and the continued opposition of the chief landowner. In many cases where a landlord's obstinacy has produced a deadlock, the law has been set in motion, and he has been forced to part with some of his land to the parish.*

Here are the names of some parishes where an order has been obtained compelling the landlords to let the laborers have land :—

					Pop.
Asfordby (Leicestershire)	1,062
Ashby (Lincolnshire)	1,845
Beaghall (Yorkshire)	396
Dunsford (Devon)	633
East Rusten (Norfolk)	603
Fosdyke (Lincolnshire)	436
Gamlingay (Cambs.)	1,722
Garthorpe (Lincolnshire)	481
Goxhill (Lincolnshire)	1,174
Holt (Dorset)	820
Kexby (Lincolnshire)	300
Llandyfriog (Cardiganshire)	748
Potter Heigham (Norfolk)	426
Preston (Dorset)	664
Tarvin (Cheshire)	1,093
Tydd St. Mary (Lincolnshire)	821
West Shutford (Oxfordshire)	271

* If a parish council cannot get suitable land by agreement and on reasonable terms, it should lay the case before the county council, who will then draft an order authorizing the compulsory hiring for a period of not less than 14, and not more than 35, years of such land in or near the parish as is specified in the order. This order will have to be confirmed by the Board of Agriculture. (The Board of Agriculture is now substituted for the Local Government Board, which was formerly the authority for carrying out this business.) If there is any opposition on behalf of the landowners concerned, or of any person interested, a local inquiry will be held, so that the Board of Agriculture may be satisfied before it confirms the order. If there is no opposition, the confirmation must be made as a matter of course. The Secretary to the Board of Agriculture, Whitehall, London, will answer any inquiries on the subject and give all necessary information.

Nearly all the land has been hired by the parish council at as low a rent as it could arrange, and let out to the allotment holders at a rent per pole or per rood just covering all the expenses.

Several parishes have had allotment land purchased for them either by the county council or the rural district council, the parish council in each case having the management. Thus Wigloft, in Lincolnshire, now has six acres, bought for it by the Holland County Council for £900, and paid for by a loan spread over 50 years. The parish council lets the land to 12 tenants, whose rent pays the interest and sinking fund. At the end of 50 years, the parish council will own the land free of any charge. The Parish Council of Keresley got the Warwickshire County Council to purchase 11½ acres in the parish, which the parish council now hires from the county council, and sublets to 18 tenants.

Most of this land is used for allotment gardens, varying in size from a few square yards up to an acre. But in many cases pasture land is let in larger holdings. Thus the Parish Council of Longcott, in Berkshire, has hired 10 acres of meadow which it sublets to four tenants; Shrivenham, in Berkshire, 20½ acres of pasture to three tenants; Weedon, in Buckinghamshire, 16 acres of pasture to one tenant; Clifford, in Herefordshire, four and three quarter acres to one tenant; Glen Magna, in Leicestershire, six acres of pasture to one tenant; Colyton, in Devonshire, 19 acres to three tenants; Witton Gilbert, in Durham, 32 acres to six tenants; Rothbury, in Northumberland, 46 acres to five tenants; and the Trefdraeth Parish Council, in Anglesey (pop. 682) has hired no less than 172 acres, which it has let to eleven tenants, one having about 100 acres.

Although only a portion of the total number of parishes has yet put the law as to allotments in force, more than 30,000 working men now hold land directly from their parish councils.

In many other parishes the parish council has been able, without itself hiring or purchasing land, to induce the landlords to set aside land for allotments. Thus in the parishes of Axmouth, Clawton, and Pyworthy, in Devonshire, the parish councils received applications for allotments, and successfully appealed to the landowners on behalf of the applicants. This happened also at Dunston, in Lincolnshire, Harthill-with-Woodall (Yorkshire), and many other places. The Slimbridge Parish Council (Gloucestershire) got two acres of charity land divided into allotments. Twyford Parish Council (Hampshire) owns two acres of land under an Enclosure Award, and lets this out in allotments. The Cold Ash Parish Council (Berkshire), which similarly owns eight acres let in allotments, reduced the rents to the lowest possible point, and improved the plots by providing new gates and fences. At Nayland-with-Wissington (Suffolk) the parish council got the rents of the existing allotments reduced. The Parish Council of St. Bride's Major (Glamorganshire, pop. 686) borrowed £400, on a 15 years term, in order to provide fences for its allotments on Ogmore Down.

When a parish council has obtained land for allotments, it is very useful to have definite regulations to prevent any abuse. Several

hundreds of parish councils have made such "Regulations for Allotments," and got them confirmed by the Local Government Board,* in London, so that each allotment holder may be protected from annoyance and the parish property from misuse.†

Common Pasture and Grazing Grounds.

A few parish councils have provided common pasture and grazing grounds for their villages. Thus at Soulbury (Bucks.), the parish council rents 21 acres for this purpose; at Hasland (Derbyshire), seven acres. In Yorkshire, the Ashton-cum-Aughton Parish Council rents eight acres; that of Kilham, 21 acres; and that of Beeford, 48 acres—all for the poor man's cow, the cottager's goose, and the horse or donkey of the small dealer or craftsman. And now, by the new Small Holdings Act, wherever allotments are provided and it is thought desirable to attach grazing ground to them, land may be acquired for that purpose.

Cottages.

A parish council cannot build cottages apart from allotments; but it can, without permission from anyone, appoint a committee of inquiry to report on the state of the housing in the parish, and print its report. If this committee reports that the cottages are ill-drained, unwholesome, and unfit to live in, and that new cottages ought to be built to supply the needs of the villagers, then the parish council should pass a resolution calling on the rural district council to build new cottages. If the rural district council neglects or refuses to comply with this request, the parish council can appeal to the county council, which, when satisfied that the need for new cottages exists, can order the cottages to be erected.

[A Rural Housing Bill is promised by the Government, which may alter all this, but at the time of writing (February, 1908) its provisions are unknown.]

Some parish councils have got cottages repaired by complaining to the district or county council. The Parish Council of Suffield (Norfolk, pop. 207) found that the parish contained some cottages which were in very bad repair. It borrowed £100 on a 12 years term, put them in good order, and let them at satisfactory rentals.

The parish of Ixworth (Suffolk, population 856) was the first to get cottages actually built for it by the rural sanitary authority. After many complaints and repeated inquiries, the Thingoe Rural District Council bought four acres of land for £160, and built eight cottages for £1,370, borrowing the money from the Public Works Loan Commissioners at three and a quarter per cent., repayable by instalments extending over 30 years. The cottages are let at £5 10s. each a year, and the surplus land at twopence per rod. This, however, was done in 1890-1893, before parish councils existed. The first case of a parish council building cottages was that of Pens-

* These regulations will now be confirmed by the Board of Agriculture, the Secretary to which will furnish inquirers with all necessary information.

† See also below (p. 9) as to power of parish council to build cottages on allotments.

hurst (Kent, pop. 1,678), and this was due to the energy of a lady councillor (Miss Jane Escombe). Beginning in 1895, it was not until 1897 that she managed to get a county council inquiry; and it took over two years more to get over all the official and other difficulties. But in November, 1899, a site of three-quarters of an acre was purchased from the clergyman for £130; and twelve months later the cottages, six in number (with six rooms each), were completed at a cost of £501 for each pair, covered by a loan of £1,800 at three and a half per cent., repayable in 40 years. At five shillings per week the receipts amount to £78, and the annual charge for interest and repayment is £74 9s. 6d.

Eight more cottages have since been built on leasehold land at a cost of £1,850, and are let at rents from four shillings to 4s. 9d. per week. The loan is repayable in 40 years, and the rate of interest is three and a half per cent.

Bradwell (Maldon R. D. C., Essex). Six cottages have been built, at a total cost of £1,450 inclusive, on an acre of land costing £45. There are on the ground floor parlor, living room, and kitchen eight feet high; and on the first floor three bedrooms eight feet six inches high. They are let at 3s. 6d. each per week. The loans were £1,250 at three and three quarters per cent., and £200 at four and a quarter per cent.

Bratton (Westbury, Wilts). Four houses have been built, at a cost of £887, on land costing £30 for 32 perches (at the rate of £150 per acre), or a whole cost, with architect's fees, etc., of £970. Each house has two rooms and scullery on the ground floor, and three bedrooms on the first floor, and is let at 3s. 6d. per week, tenant paying rates.

Linton (Cambridgeshire). Application was made by this council to the county council on behalf of five parishes in the district, but the others are standing over until Linton has gone through. It is hoped to build for £130 per cottage, then let at 2s. 6d. per week. Land cost £125 for two acres. A loan of £1,500, repayable in 61 years, has been sanctioned by the Local Government Board.

Malpas (Cheshire). A loan of £2,500 was obtained for sixty years, and twelve cottages provided at an estimated annual cost to the rates of £11 per annum on an assessable value of £4,891. Only part of the land has been used, and a rent of four pounds per annum is being derived from the unbuilt portion.

Limpsfield (Surrey, pop. 1,911) is another place which has been very active. In 1901 the parish council found the cottage accommodation in the village to be insufficient and, after very careful inquiry, representations were made to the principal landowner in the matter, with the result that he promised to build immediately twelve additional cottages as an experiment. In 1906 it was found that there was still a scarcity of cottages, and it was proposed that a special report on the matter should be laid before the rural district council. Eventually the parish meeting decided that the work had better be done by voluntary effort, and a building company was formed for the purpose. No difficulty was found in raising the

money, and cottages, which are already begun, will be let at a low rental, paying a small fixed charge by way of interest on the capital outlay.

In Ireland much more has been done than in England. There are now over 15,000 cottages in Irish rural districts, built, owned and let out to tenants by the local public authority.

Lastly, it is important to remember how the Small Holdings Act, 1907, has changed the law as regards building in connection with allotments. Formerly the rural district council could improve and adapt land acquired by it for allotments. Now these powers have not only been transferred to the parish council, but they have been considerably increased by the fact that the parish council is allowed to erect buildings on the allotments which it holds. A parish council may, if it think fit, put up a cottage on any of its allotments which is not less than one acre in extent.

Recreation Grounds.

Many parish councils have secured useful recreation grounds for their villages. Sometimes these have been given free. At Titchfield (Hampshire) five acres have been given; at Nacton (Suffolk) one acre; at Westbury (Wilts.) half an acre. The parish council of Aldenham (Herts., pop. 2,487) had given it half an acre with gymnastic appliances; and has been offered another four acres for a public park. At Mayfield (Staffs.) the inhabitants themselves presented the parish council with one acre for this purpose. In other villages, land has been let to the parish council at a nominal rent, such as a shilling a year. At Roade (Northamptonshire, pop. 691) the parish council has thus secured a recreation ground of half an acre; at Calverton (Notts.) one of two acres; at Bramcote, in the same county, one of four acres; at Harrow Weald (Middlesex) as much as five-and-three-quarter acres; whilst on the other hand the parish council of St. Margaret-at-Cliffe (Kent), having been given a zigzag footpath up the cliff, has got the use for sixpence a year of sufficient land to put seats on. Less fortunate villages have had to rent land for recreation grounds. The parish council of Aston Tirrold (Berks., pop. 289) hires two acres, whilst that of Twyford (pop. 1,106) in the same county, hires ten acres; Wymondham (Norfolk) is content with half an acre, and Clifton (Lancs.) with three-quarters of an acre, whilst Naseby (Northamptonshire) hires 11 acres. Many parish councils (for instance, that of Great and Little Hampton, Worcestershire) have improved the village greens, so as to make them fit places for the children to play on. The parish council of Barrowden (Rutland) has hired seven acres specifically for a cricket ground; that of Norton-under-Hamdon (Somerset) one-and-a-half acres for a children's playground, whilst Barford Parish Council (Warwickshire) went in for five-and-a-half acres for this purpose. Northolt Parish Council (Middlesex) has got one-and-a-quarter acres of land for a village green at a nominal rent of five shillings a year. Sometimes much larger areas are hired by parish councils for the combined purpose of recreation grounds and common grazing. Thus Aberffraw, in Anglesey, rents by its parish council

16 acres; Whittington, in Worcestershire, 20 acres; Chigwell, in Essex, 49 acres; Pelsall, in Staffordshire, as much as 55 acres.

A few parish councils have purchased land for recreation grounds; thus Chulmleigh (Devon) has bought a little ornamental garden of four poles extent; Horndon-on-the-Hill (Essex) has bought one-and-a-half acres; Forest Row (East Sussex) four acres; Horsepath (Oxfordshire) four acres; Wattisfield (West Suffolk) four-and-three-quarter acres; and Ropley (Hants.) as much as seven acres, part of which it devotes to allotments. In such cases the parish council borrows the money to pay for the land. Thus Burwell (Cambridgeshire) borrowed £346 to buy some recreation ground; Willingham, in the same county, £500; Cuddesdon, in Oxfordshire, £160; Winterslow (Wilts) £250; and Caterham, in Surrey, as much as £2,700—all for recreation grounds. Here again the parish council may make bye-laws, which will be confirmed by the Local Government Board, for the regulation of its recreation ground. In 1905-6 and 1906-7 the Board has confirmed such bye-laws made by various councils—Potten (Bedfordshire), Tiverton (Somerset), Willingham (Cambridgeshire), South Normanton (Derbyshire), Combe Martin (Devon), Aldenham (Herts.), Frensham (Surrey), etc.

Public Wharf.

At Acle (Norfolk) a small piece of land by the river, forming a sort of wharf, is rented from the lord of the manor, in order that the inhabitants may have the free right to load and unload boats, independently of the riparian owners and occupiers.

Drying Ground.

At Cummersdale (Cumberland, pop. 615) the inhabitants felt the want of a drying ground, and the parish council rented half an acre of land for common use.

Burial Grounds.

When the parish churchyard gets full, or is too far off from part of the parish, it is a great convenience for the parish to be able to get a new burial ground. This has been done by nearly 700 parish councils. Occasionally the parish council has been able to get the land for nothing, on proving that it was really needed, as at Steeton-with-Eastburn (West Riding of Yorkshire), where the chairman of the parish council presented the council with one-and-a-half acres. In some cases the land has to be hired on a long lease; the parish council of Brisley (Norfolk) has thus rented half an acre. But nearly always the parish council has bought the freehold, obtaining a loan for the purpose. Sometimes, as at Isleham (Cambridge), all that is obtained is an additional half-acre beside the churchyard. At other times much more is bought; the parish council of Dolwyddelan (pop. 1,112), in Carnarvonshire, has purchased nearly eight acres. In a few cases where the landowner could not be induced to sell the necessary land adjoining or near the churchyard, the parish council prevailed on the rural district council to take it compulsorily.

These purchases are made by means of loans. Thus the Curston Parish Council (Norfolk, pop. 986) borrowed £340 to buy land for a new burial place; the Hauxley Parish Council (Northumberland, pop. 1,627) borrowed £381; and the Rainham Parish Council (Essex, pop. 1,725) borrowed £400. In 1905-6 the Local Government Board sanctioned loans amounting altogether to £7,478, and in 1906-7 £6,765 to parish councils for burial grounds.

Mortuary.

The Parish Council of Clifton, a mining village in Lancashire (pop. 3,000), by setting aside a stable at the back of the council offices, has provided a mortuary for common use.

Parish Land Recovered.

Many small pieces of land belonging to the public at large have been "lost" in years gone by for want of anyone to stand up for the public rights. Parish councils have been examining the Enclosure Awards, Tithe Awards, and Lists of Charities for their parishes, and some of this "lost" land has been recovered. For instance, the Askern Parish Council (West Riding of Yorkshire) is now in possession of half an acre of land, including a useful quarry, which had been duly awarded to the parish years ago, but had been quietly usurped by the neighboring landowner. When the village got a parish council to assert the public rights, the present landowner consented to restore the half-acre in question. At Shirland (Derbyshire) the parish council compelled a landowner to disgorge a small strip of land by the high road which he had annexed. The parish council now receives a small annual rent for its use. The Hurley Parish Council (Berkshire) found that the lord of the manor had for years been allowing people, now and then, to enclose bits of the common land, on condition that they paid him a small quit rent. The council complained, and this filching of the public rights has been stopped. At St. Budeaux (Devonshire) the Government had appropriated the village green under some plea or another, but the parish council has now obtained possession of this half-acre, hiring it from the War Office at the nominal rent of a shilling a year. At Pilton (Somerset) the parish council got the lord of the manor to transfer to them free of cost the site of the old parish pound, to be planted with trees and shrubs. At Long Preston (West Riding of Yorkshire) the lord of the manor has transferred the village greens to the parish council free of charge; and at Thundersley (Essex) the same is being done with regard to a large common. Many other village greens, the legal ownership of which has become vested in the lord of the manor, have been let to parish councils at a shilling, or some other nominal rent, so that the people might have a legal right to the use and management of them. By the activity of parish councils many commons and greens have been protected against encroachments and appropriation. Thus at Cellan, in Cardiganshire, the parish council had the common accurately measured, and the public ownership put on record. The Parish Council of Send and Ripley (Surrey, pop.

2,301) has made byelaws regulating the use of its village green and other open spaces. This should be done by every parish council which can prove its title to the green.

The green strips by the side of the high roads are public property, and ought never to be enclosed. In the past many thousands of these pieces of land have been quietly stolen by the neighboring landowners. Now it is the duty of the parish council to watch them, and the duty of the county council to protect them. Many encroachments have been thus stopped. The Parish Council of St. Bride's Major (Glamorgan., pop. 686) successfully fought the Earl of Dunraven, who had tried to make a big encroachment.

Parish Halls or Rooms.

Many parish councils have acquired or built convenient public rooms for the village to meet in, and offices for the parish business. At Charing (Kent) the parish council bought 10 poles of freehold land and built a hall, getting a loan of £286 for the purpose. The Boarhunt Parish Council (Hampshire) did the same thing. Compton (Hants.) bought three-quarters of an acre and built a hall; Hessle, in the East Riding of Yorkshire, half an acre for the same purpose. Dysarth (Flintshire) borrowed £88, and West End (Southampton) £450. The Parish Council of Hawkehurst (Kent) borrowed £625 to build its parish hall, which includes offices for the parish business. But a suitable room can be put up for much less. The Parish Council of Trefriew (Carnarvonshire) only had to borrow £114 to pay for its parish room; and the Parish Council of Underskiddaw (Cumberland) only required £150 for the same purpose. The Parish Council of Bovey Tracey (Devonshire) borrowed £400 to provide themselves with a "town hall," but South Stoke (Oxfordshire) was contented with spending £50, and Gunthorpe (Nottinghamshire) with spending £120 on their "parish rooms." At Cheddar (Somerset) the parish council bought a house with a quarter of an acre of garden, and converted it into a public hall and parish offices. This cost about £300, which the parish borrowed for a term of 30 years, during which it will pay interest and sinking fund, and after that will have the house and building free of charge. The Parish Council of Clifton (Lancs., pop. 3,000) bought two cottages for £500, and uses one for the parish offices, while the other is let to a tenant.

Schools.

Parish councils have no direct authority over the schools, but by means of the school manager whom they elect, or by making representations of their needs to the proper authority, they may add materially to the welfare of the scholars. A school manager appointed by the parish council should be required to give a report to the parish council of what has passed at the education committee. The report would, of course, be confined to such matters as are of public interest and not confidential. Another matter in which a parish council might usefully bestir itself would be to urge the county council to provide facilities for technical education in the

village. The Parish Council of Yarm (Yorkshire) secured for their village the services of an excellent horticultural lecturer from the North Riding County Council as a result of which a very promising horticultural society has been established there.

The Preston-on-Tees Parish Council (Durham, pop. 800) finding that the distance from the homes of many scholars to the existing school was too great to allow of their attending regularly, made representations to the Durham County Council, and a new school was started for the children in the outlying parts of the parish. At Limpsfield (Surrey) the school manager appointed by the parish council personally started a canteen, which fed 60 children who came from a distance at a charge of one penny each per day. The plan has been continued for a second season.

Charities.

In many parishes the parish council has reformed the charities by appointing some of its own members as trustees. Sometimes, as at Burley-in-Wharfedale (Yorkshire), the rents of parish land or cottages have simply been taken by the overseers in aid of the poor rate (and so helped to pay the rates of the squire, the parson, the innkeeper, etc. !). This was promptly stopped, and the money given to the deserving poor. Then the poor were no longer compelled to come up publicly to claim their doles, but arrangements were made for paying them quietly in their own cottages.

Sanitation.

It is, properly speaking, the business of the rural district council and the county council to see that every parish is in a proper sanitary condition ; that every cottage has a good supply of pure water ; that no stinking ponds, foul ditches, or other nuisances pollute the air or water ; and that every cottage has decent sanitary conveniences. The parish council can, however, itself attend to small matters. At Marske-by-the-Sea (Yorkshire) the sanitation left much to be desired. An expert, who was called in, prepared an elaborate scheme ; but the parish council found it too expensive, and so set themselves to remedy matters by giving a thorough attention to the sewers and sewage outlets, disconnecting of all rain-pipes from the drains, and so on. But, generally speaking, where the parish council comes in is in the power of making complaints to the rural district council, without any man running the risk of displeasing his landlord or his employer. Many parish councils have successfully used this power. They have pestered the rural district council with complaint after complaint, until the nuisances have been done away with. In Hurley (Berks.) the parish council found some of the cottages without any proper water supply, and using an infected source. It complained to the district council, got this source analysed and condemned, and compelled the cottage owners to provide a better supply. Sometimes the parish council has had to appeal to the county council, which has stirred up the district council and made it move. Where the county council has a medical officer (as every county council ought to have), the parish

councils have found it very useful to send him their complaints, and to get him to inspect the parish. If neither the district council nor the county council will help the parish, then the parish council can appeal to the Local Government Board in London. The Parish Councils of Threapwood (Cheshire, pop. 305) and Hildenborough (Kent, pop. 1,407) complained to their district councils time after time about the unhealthy state of their parishes, owing to the bad arrangements for drainage. Finally they appealed to the Local Government Board in London, and the district councils have been told that they must provide proper drainage for these villages. The village of Holcot (Northamptonshire, pop. 343) was always suffering from bad illnesses because there was no drainage. When the parish council complained to the Local Government Board, the district council was ordered to put the village into a sanitary state at once.

In 1905 there was a complaint against the rural district council of Dunmow that the want of a proper water supply in the village of Felstead was injuriously affecting the health of the inhabitants. The Local Government Board directed a local inquiry to be held, and eventually issued an order requiring the district council to carry out their duty within six months. The district council, however, did not comply with the order, and so in August, 1907, a mandamus was obtained from the High Court of Justice to compel them to do so.

In many parishes the parish council has itself dealt with small nuisances, and got them stopped. At Clifton (Beds.) the village suffered from a filthy pond, illegally polluted by drains and itself polluting an open ditch. To put this right meant an expense of £50 or more, and no one could tackle it. When the parish council was established it took up the job, cleaned out the pond, stopped the drainage into it, and scoured the ditches. It cost for one year a special rate of 4½d. in the £, but it improved the health of the village. The Mundesley Parish Council (Norfolk) has hired half an acre of land as a dumping ground for parish refuse. The parish council of Chesterton (Staffordshire) has done well in getting a sewage farm of its own of 140 acres.

Water Supply.

Although the provision of a new water supply on a large scale is a matter, not for the parish, but for the rural district council, the parish council has power to improve any existing supply within the parish. This power has been exercised in many hundreds of parishes, to the extent of making small but extremely useful improvements. Thus the parish council of Great Stambridge (Essex) found that the village badly needed better water. It obtained as a free gift from the landowner a few square yards of land, on which a well was sunk, a pump and horse-trough erected, and the whole covered by a neat roof. Kilminster (Wilts.) wanted a new parish pump; one pole of freehold land was given free of charge by the owner to the parish council, and a pump erected for the use of the public for ever. At St. Tudy (Cornwall) the parish council had the drinking water

analysed, and, finding it unsatisfactory, got the supply improved and increased. At Gaydon (Warwickshire) the parish council was given a good supply of water, so that it should be for ever maintained in good order for the village. The parish council of Humshaugh (Northumberland) has bought the freehold of a small piece of land, one pole in area, so as to secure for ever a public watering place. The Churchstanton Parish Council (Devon) successfully asserted the public right to certain springs of pure water, and laid down pipes to supply the neighbors. At Thundersley (Essex) there is a good water supply, but the owners of some cottages neglected to lay it on to them. The parish council took the matter up and compelled them to do their duty. But the best work of that parish council was its standing up to a village tyrant. A local landowner filled up and destroyed an ancient spring, which the public had used from time immemorial, and put up barbed wire and tar to prevent the cottagers approaching it, whilst the county policeman was sent round to frighten them. The parish council raised a subscription to fight the case, and by an action in the Court of Queen's Bench (*Reynolds v. Lincoln*) in May, 1899, compelled the landowner to clear out and re-brick the spring, and remove all obstructions to the public use of it. The Ashton Parish Council (Northamptonshire) had an instructive experience. When the churchyard was enlarged, it became necessary to divert an old line of pipes supplying water from a spring to the village well, and the clergyman took upon himself to run the supply to his own house, allowing the village only the overflow from his tank. The parish council (which consisted of a grocer, a gardener, a platelayer, a signalman and a carpenter) then took steps to protect the village, and commenced to put down pipes connecting directly the well with the spring. Thereupon the steward to the local landowner (Duke of Grafton) came down on the parish council, and declared that the pipes, and even the water, belonged to the duke, because it ran under the public high road. At first he tried to stop the work; then he claimed the ownership of the new pipes which the parish council was paying for; at last he offered that the duke should pay the expense, but said he must own the pipes. The parish council stood firm, and said that the parish was determined to possess its own water supply, which they and their forefathers had enjoyed from time immemorial. Finally, the duke, by his steward, made an awful threat. He would appeal to the Government Auditor, and get the amount "surcharged," upon which, as his agent explained, those parish councillors who had ordered the expenditure would have to pay it out of their own pockets. He actually tried to carry out this threat, but his agent fortunately mistook the day, and appeared twenty-four hours too late. So the parish council triumphed, and now enjoys its own good and abundant water supply. This happy result was largely due to the wisdom of the parish council in engaging a good man as clerk. Instead of getting their work done for nothing, and having it done badly, the council pays a salary of £6 a year, and shares with two other parish councils the services of a competent officer.

Public Lamps and Lighting.

Upwards of a thousand parishes have adopted the Lighting and Watching Acts, which enable the parish council to put up lamps and light the village streets and roads at night. The Parish Council of Elmswell (West Suffolk) is one of those that have done this; that of Menstone (West Riding of Yorkshire) is another (it borrowed £200 to pay for the lamps, and did the thing handsomely). The Parish Council of Treeton (also in the West Riding of Yorkshire) spent £140 on public lighting at starting; and Brampton (Cumberland) borrowed £100 for this purpose, and Seaton Delaval (Northumberland) £138. But usually much smaller sums suffice. The annual expense of lighting is paid for by a separate lighting rate on the parish, which is usually only a half penny or a penny in the pound. The Lighting and Watching Act involves a separate rate and a somewhat cumbrous procedure. Other parishes have asked the Local Government Board to confer on the rural district council the power to light the village; and then got the rural district council to delegate this power to a parochial committee.

Assessments and the Parish Finances.

Some parish councils, like that of Bradfield St. George (Suffolk, pop. 417) have formally adopted section 3 of the Poor Rate Assessment and Collection Act, 1869, and so made the owners of all cottage property themselves pay the rates. This is found a boon to the poor.

Before the parish council came into existence there was very often no one to see that the churchwardens and overseers did their work fairly as to the assessment of property and the collection of rates. When the parish of Penalt (Monmouthshire) got a parish council, it was discovered that some houses had for years been left out of the assessment, so that the owners of them escaped their share of the rates; and that a large balance was owing to the parish by a former overseer. The parish council insisted on this being made right, and so saved the parish in one year more than the whole amount of its expenditure since that time. At Barford (Warwickshire, pop. 689) the parish council found that the three great houses of the parish were scandalously under-assessed, and got them put up by £200. This at once reduced the rates by a penny in the pound.

At Blackshaw (West Riding of Yorkshire) the parish council thought that the parish was unfairly treated by the county council in being assessed at too high a sum towards the county rate. The parish council twice appealed against the county rate basis, and was successful in getting it considerably reduced, saving the ratepayers of the parish a large sum annually. Similarly, when the neighboring town of Todmorden became a municipal borough, it strove to put upon Blackshaw parish the maintenance of some roads which were in a bad state of repair. The parish council stood up for its rights and got compensation for the parish.

Markets.

Some parish councils manage little markets or annual fairs, and take the profits in aid of the rates. At Bawtry, in Yorkshire, the parish council rents the market place from the lord of the manor, and receives the market tolls. At Bardney, in Lincolnshire, the parish council maintains the village green and, with the consent of the lord of the manor, lets it out on the occasion of the annual fair, and uses the rents for parish purposes.

Roads, Paths, and Bridges.

Many parishes have, through their parish councils, got their footpaths and little bridges put in order, and sometimes new ones made. Thus, quite small parishes, such as Welford (Berkshire, pop. 791) have gravelled their footpaths and repaired their footbridges, so that the children can go to school without getting their feet wet. The Parish Council of Snape (Suffolk, pop. 529) finds it convenient to have its own gravel-pit for footpath repair, and so rents a quarter of an acre of land and digs its own gravel instead of buying it. The Parish Council of Orrell-with-Ford (Lancs., pop. 2,104) is properly proud of having "name-plated all the roads, finger-posted all the footpaths, and twice cleaned out the boundary brook." The Parish Council of St. Tudy (Cornwall, pop. 495) agitated for and got built a new footbridge over the river; and the Parish Council of Clifton (Lancs.) has put several footbridges over streams and over the railway. The Parish Council of Weston Turville (Bucks.) took in hand a dangerous corner of a road, and bought a strip of garden to widen the highway. The West Mill Parish Council (Herts.) fenced the road off from a bog with white-painted posts. At Timperley, in Cheshire, there was a footpath leading to a level crossing over the railway. This was a cause of serious danger and occasional accidents. As it proved to be impossible to get a railway bridge, the parish council made an exchange of land and diverted the footpath so as to obviate the dangerous crossing. At Newstead (Nottinghamshire) a new road was needed, and the parish council has rented altogether five acres of land in order to lay this out. Lower Dylais (Glamorganshire) wanted a new footpath and made it, formally hiring the narrow strip of land on a long lease. Whitwell (Derbyshire) was in the same case, but was able to hire the strip at a nominal sum. The Parish Council of Blaenpenal (Cardiganshire) made a new cart-way, but was able to buy the freehold of the little bit of land required. At Ockbrook (Derbyshire) the parish council devoted its attention to improving the streets and highways. It adopted the Lighting Act and erected lamps (rate threepence in pound for this), gave names to the roads and streets and put up name-boards, made up and repaired the footways and approaches, and removed nuisances.

Motor Cars.

Many villages suffer very serious inconvenience and danger from careless and "scorching" motorists. Every parish council should petition the county council, as the Limpsfield Parish Council (Surrey)

has done, through the district council to get the Local Government Board to enforce the limit of ten miles an hour in dangerous parts of the roads. And the county council itself, without the intervention of the Local Government Board, ought to put up sign-posts at all dangerous corners, cross-roads and steep hills.

Fire Protection.

More than 500 parish councils have taken steps to protect their villages against serious fires. Sometimes, as in the cases of half-a-dozen parishes near Bedford, the councils subscribe towards an efficient fire brigade maintained by a neighboring town. More usually, the parish council organizes a volunteer fire brigade of its own, and provides appliances. At Tempsford (Beds., pop. 434) the parish council pays the engineer's salary; at Burnham (Bucks., pop., 3,245) the men are paid for drills; elsewhere, as at Malpas (Cheshire, pop. 1,139), the men are paid for attendance at fires. At Flimby (Cumberland, pop. 2,482) the members of the parish council themselves act as a fire brigade. Other parishes have borrowed money for fire brigade purposes. Thus Walgrave (Northampton) borrowed £60, Easton (Northampton) £100, and Bishopstone (Wilts) £70 for fire engines, etc.; Dagenham (Essex) £378 for fire extinguishing appliances; and Hornchurch (Essex) £368 for engine house and appliances.

Railway, Post, and Telegraph Facilities.

Many parish councils have succeeded in getting better service from the Post Office. Thus the Parish Council of Broadhempston (Devon, pop. 445) got a second, or evening, postal delivery; that of Hadley (Salop) got several additional pillar boxes and an afternoon postal delivery; that of Churchstanton (Somerset, pop. 581) obtained a money order office; those of East Claydon (Bucks.) and Elwick (Durham) have given a guarantee against loss and so secured a telegraph office. Newick (Sussex, pop. 953) and Eaglescliffe and Preston-on-Tees (Durham) got better train services from the railway companies; St. Bride's Major (Glamorgan, pop. 686) made the company put up bridges and stiles; while the Parish Council of Clifton (Lancashire) got the railway company to replace a level crossing by a footbridge.

Libraries and Reading Rooms.

In many villages a reading room is now maintained by the generosity of the clergyman or the squire. Often these are just what the village desires, but sometimes they are not. In one parish reading room in Surrey no Liberal or Radical newspaper is allowed. In one Sussex parish the clergyman gave his copy of the *Times*, but refused to let the *Daily News* be presented, on the ground that it was a "party organ"! But in a few parishes the parish council now maintains a free public library and reading room, where the inhabitants can read just what books and newspapers they please, without being beholden to anyone. At Corwen (Merionethshire, pop. 2,723) the library was opened in 1896; it has a newsroom open 78 hours a

week, and 250 books ; it pays its librarian nine pounds a year ; costs altogether £80 a year ; and is managed by a committee of six parish councillors and six others, whom the parish council co-opts. Halkyn (Flint., pop. 1,389) opened its library in 1898 ; already has 700 books and a newsroom open 72 hours a week ; pays its librarian £25 a year ; and co-opts four persons to serve with five parish councillors as its library committee, which has an income of £63. Sometimes, as at Colwall (Hereford, pop. 1,892), the parish council gets a library building provided by private endowment. What can be done by a tiny village is shown at East and Botolph Claydon (Bucks., pop. 336) where a library was opened by the parish council in 1897, which now contains over 600 books. The squire has built and placed at the disposal of the council, at a nominal rent, a parish hall, reading room, library, and caretaker's rooms. The library work is done gratuitously by a lady, who attends every Saturday afternoon. In the neighboring parishes of Middle Claydon, Grandborough, and Water Eaton (Bucks., pop. of each between 200 and 300), a joint library is maintained by the three parish councils, largely through the help of Sir Edmund Verney, whose daughter gives her services as librarian. It is open 18 hours a week, and contains over 2,300 volumes, with a printed catalogue. The management is by a committee of five parish councillors ; and the total cost is about £18 a year, of which only £10 comes from the rates. In all these cases the parish council levies the full library rate of one penny in the pound, and ekes this out with such receipts as sales of old newspapers, fines, and subscriptions.

Bathing Places.

A score of parishes have adopted the Baths and Washhouses Acts, and now provide swimming baths. Sometimes, as at Betchworth (Surrey, pop. 1,789) and Alveston (Warwick) the parish council has merely put up sheds, screens and platforms, so as to enable the river to be used in comfort, and made regulations, confirmed by the Local Government Board, as to the times for women and men respectively. At Ibstock (Leicester, pop. 3,922) the parish council built a bathing tank 6ft. deep, with corrugated iron fences ; costing £90 ; supplied with water from the brook ; and looked after by an old man at 7/6 a week. A penny is charged for admission, or two shillings for a season ticket. But the most successful bath seems to be that at Snitterfield (Warwick, pop. 727). Here an old brick tank, 70ft. by 30ft., that had been long unused, was obtained by the parish council on lease from Lady Trevelyan at a nominal rental. The council spent £40 in putting it in order, fencing it round with tarred matchboarding, and providing a comfortable dressing-room and diving-pier. The water is supplied by a spring and is constantly changed. The bath is open free five days a week, certain hours being set apart for women and girls. One hour a week may be reserved on the sixth day by season ticket holders paying a small subscription. The nearest cottager and his wife act as caretakers for 30s. a year, and the total annual cost is only about £5. The vicar has gratuitously taught the boys to swim. He offered to teach the girls if the

parish council would provide bathing dresses for them, but the council (consisting of a "gentleman," a doctor, a farmer, and two hurdlemakers) declined to do so (though bathing dresses are provided out of the rates in London baths). During the summer 30 or 40 persons use the tank daily. Many children bathe regularly every noon; and the bath is highly appreciated by the parish. Swimming baths have also been established by the parish councils of Snodland (Kent, pop. 4,136), Shere (Surrey, pop. 2,184); and Blaby parish council (Leicestershire, pop. 1,842) hires a few square yards of land for a bathing station.

It is to be regretted that so few parishes have yet followed these examples. The whole capital cost of a good open-air bath need not be incurred at once. The bath may be made one year, cemented the next, enclosed the next, and so on. The annual cost of maintenance need only be trifling.

No parish council seems yet to have provided hot-water baths for individual use, though these would be a great boon to every mining village. Nor has any parish council had the enterprise to provide a laundry for public use, in spite of the great success in London and elsewhere of this convenience to small households.

Some Typical Parishes.

The following account of the work of the parish council in four separate parishes in different parts of England, shows what has actually been done.

KINGSTEIGNTON (DEVONSHIRE).

Population in 1901, 1,942. Area, 3,975 acres. Number of parochial electors, 370. Rateable value, £14,280.

This parish has throughout taken considerable interest in its parish council elections. The council has had from the first a Liberal majority, about evenly divided between Church and Dissent; but the elections have turned more on "village politics" and personal preferences, than on Imperial politics or religion. The council (13) now consists of one clergyman, three farmers, two schoolmasters, two builders, one mine-owner, one shopkeeper, and three wage-earners. The council has appointed trustees of the charities, and set on foot inquiries about them which have done good; it has regularized the assessments; it has preserved one footpath from a threatened encroachment; it obtained the tithe-map from the vicar and transferred it to its own custody; it hired two fields, comprising five-and-a-quarter acres, and let them out in 33 allotments; it moved the district council to provide a new water supply for the parish at a cost of £2,000, and built a new reservoir capable of holding 85,000 gallons and costing £1,800, which (though hotly opposed) is now appreciated and used by nearly all the parish; it has organized a parish fire brigade, providing £50 worth of fire-hose and other appliances; it has obtained from the district council its own appointment as a parochial committee for sanitary purposes, and has got nuisances stopped; it has cleaned out the village leet (or water course) which was in a dangerous state; it has repeatedly moved the district council

to improve the drainage, obtaining more frequent flushing of sewers and good ventilating shafts, and causing steps to be taken to prevent floodings and storm damage. It owns three houses, bringing in a small sum towards the expenses, which are rigorously kept down. It has a division under the Newton Abbot Corps of the St. John's Ambulance Brigade, with full uniform and equipment for dealing with accidents and removal to hospital. It has taken gas from Newton Abbot for street lighting purposes, and is without doubt the best lit village in the country.

AYLESFORD (KENT).

Population in 1901, 2,678. Area, 4,057 acres. Number of parochial electors, about 550. Rateable value, about £15,981.

In this parish (which includes two villages, one old and proprietary, the other modern and manufacturing) there has never been any active fighting in the elections; and though the meetings have been well attended, they have lately not been seriously contested. The parish council has always been elected by show of hands without a poll, and only once has any old member been rejected. The council (12) now consists of a sand merchant, a manager and assistant manager of a cement works, two doctors, two grocers, the cashier and secretary of a brickworks, a lime merchant, a farmer, and an engineer; mostly Conservative in politics; partly Church, partly Dissent. The council has done useful work with regard to the charities, putting representatives on the board of some important almshouses. It has stopped at least one job, by which it was proposed to reduce to a nominal sum the rent paid for a way-leave. The council appealed to the Charity Commissioners against it, and got a substantial rent fixed. It has encouraged revision of the assessments, and got raised those (especially of licensed houses) that were too low. It has prevented unwarranted diversions of public footpaths, even when desired by the dominant landowner. It has increased an already considerable supply of allotments by hiring three and a half acres, let to 40 tenants. It has obtained two recreation grounds, one of three and one of nine acres. It negotiated with a neighboring water company, and got considerably better terms of supply. It has provided fire hydrants. It has greatly improved and extended the lighting of the village by gas lamps. It helps the county council to provide the parish with technical classes every winter. It has an excellent sewage arrangement, which cost nearly £20,000. The expenditure (other than that for lighting) is covered every year by a penny rate, except in the year that the recreation grounds were laid out, when it amounted to threepence in the pound.

HORSFORD (NORFOLK), ST. FAITH'S UNION.

Population in 1901, 691. Area, 4,249 acres. Number of parochial electors, 151. Rateable value £2,560.

This is a good sample of a purely rural parish, where the parish council, though not brilliantly successful, has been of real advantage. The first election (1894) excited great interest, and there was a fierce

contest and a poll. An active Radical majority was elected, which got some things done, but found more difficulties than it expected. The next three elections were decided by show of hands, and Conservative majorities were elected. Later on, in the same way, eight Liberals and one Conservative were elected, and these have gone steadily to work in a quieter way than the first council. The councillors long included four tenant farmers, three farm laborers, one brickfield laborer, and one agent (a townsman). The council, since 1894, has secured a useful footpath against possible diversion; hired eight acres of land for allotments; got the county council to hold a public inquiry into the overcrowded state of the village and need for more cottages—the inquiry attracted so much attention that the worst evils got remedied—obtained a letter-box where needed from the Post Office, and got a savings bank branch opened in the parish, by guaranteeing the cost; stirred up the district council about a wet and dirty lane which had never been repaired within living memory—this caused the landowners to remedy their neglect. Perhaps the most striking result has been the care of the parish land. These 208 acres of heath had been neglected for years, and the neighboring landowners and occupiers were quietly establishing a right of way across it. The parish council elected trustees to manage this charity, and these fenced in its land from the road, enclosed and drained eight acres, which are now let for grazing; and, after a hot discussion with the squire, maintained its fence against his claim to a right of way. The district council now owns and lets the shooting on the watering pits, gravel pits, and other odds and ends of land belonging to the parish under an Enclosure Award of 1810; and the rent is credited to the parish for the maintenance of roads. When land is wanted for allotments, the landowners are quite willing to let it to the parish council. But the real value of the parish council here is much more its intangible results on the village life and character. All classes are brought together to discuss their common business, and the laborers have been taught to look the squire and the parson in the face, and to realize that the best men of their own class make as good and trustworthy councillors as landlords and farmers. “Everyone,” it is now said, “has become independent.” They know that any real grievance in the village can now be remedied, and the council serves as a vent-hole for complaints and suspicions that would otherwise have smouldered dangerously for years.

NEWICK (SUSSEX).

Population in 1901, 953. Area, 1,977 acres. Number of parochial electors, 200. Rateable value, £4,876.

One grave defect of the parish council, as it is usually administered, is its failure to attract any public interest. It is not enough to put up a notice on the church door. It is better to do as the Parish Council of Orrell-with-Ford (Lancs., pop. 2,104) has done, viz., to meet regularly every six weeks on fixed dates. The lack of public interest is partly due to the neglect of the councils to let the parish know what they are doing. An admirable example to the

contrary is seen at Newick (Sussex), where the parish council presents an annual report, which is printed in the local newspaper. As the report for 1899-1900 gives a vision of the work of an active parish council, it is here printed in full.

ALLOTMENTS.—The committee have now a prospect of securing land and having nearly completed their proposals, the council hope shortly to have before them a definite and complete scheme.

BOOKS OF REFERENCE.—Copies of further Acts of Parliament have been added.

BUILDING BYE-LAWS.—In view of the continued construction of insanitary dwellings in the parish, the council have urged on the authorities the necessity of enacting building bye-laws for this district. The response has not been favorable, but, looking at the importance of this question, the council will probably feel it their duty to press it further.

CHARITIES.—The council having inquired as to the existence of any parochial charities, have received from the Commissioners an opinion that there are none, but further inquiries remain to be made.

DISTRICT ROADS.—The council, having persevered in their former course, find that there has been some improvement. They have also obtained from the highway authority an undertaking to repair the Rough, which has, however, not yet been acted on. The council have resolved not to apply for powers over the district roads under section 15 Local Government Act, 1894, but unless such roads are better managed in future to seek to obtain the transference of such management to the county council under section 16 of the above Act, or otherwise.

EDUCATION.—Two classes for women and girls under the county council have been carried out by Mrs. Gravely with satisfactory results. It remains to arrange technical or other classes for men and boys, and the organizing secretary (Mr. Young) has consented to address a public meeting shortly to that end.

FINANCE.—Considerable progress has been made. All payments under the authority of the council, whether of accounts or of extra remuneration to officials, have been systematically examined by the finance committee, who have also ascertained the causes of the rise in the poor rate in May, 1898. They have also established the right of ratepayers to examine the district council minute book. The drainage committee have partly explained the heavy special drainage rate and will further report thereon.

FIRE BRIGADE.—An ineffectual communication was made to the Bonfire Boys' Society. It remains to decide whether to repeat that communication next year or what other attempt to make, if any. Inquiries should be made of those parishes who have already successfully completed their arrangements.

FOOTPATHS.—The committee have collected much information as to the history of the more important footpaths with a view to determining the liability for their repair. They are waiting legal advice as to preserving the testimony they have collected. Meanwhile no further expense has been incurred.

ISOLATION HOSPITAL.—The council have supported an application to the authorities for an isolation hospital for the district, which is likely to be acted on.

PARISH DOCUMENTS.—The committee was re-appointed but have been unable to proceed for want of the required directions from the county council, whose attention will probably have to be recalled to the subject.

POSTAL FACILITIES.—The council have secured from the General Post Office the promise of a new pillar-box at Cornwell's Bank for outgoing letters. An application for the despatch on Sundays of letters posted at the railway station was not granted.

REPRESENTATION ON DISTRICT COUNCIL AND BOARD OF GUARDIANS.—The memorial presented by the council in 1898 has resulted, not in an increased representation for Newick, but in a proportionate increase in rural representation on the board of guardians at the expense of urban.

SEWAGE.—The committee appointed by the council have devoted much attention to this subject, and have furnished the council with considerable information. There has been some alteration in the methods of the sanitary authority in providing super-

vision and in cultivating the irrigation area. It remains to ascertain how far the present methods are adequate for the improvement of the drains or the relief of the ratepayers.

STEAM ENGINES ON HIGHWAYS.—The county council have acted on the suggestion of the parish council for the publication of the conditions under which steam traffic on highways is permitted. The issue of the new regulations of the county council is now awaited.

TRAIN SERVICE.—Among other railway business transacted the council, having been informed by the railway company that the late train run the previous winter between Lewes and Newick had been worked at a loss, requested the company to extend the train to East Grinstead, a request in which they were supported by the councils of East Grinstead, West Hoathley, Horsted Keynes and Danehill. The company, however, preferred to run the same train as before, but on Saturdays, an experiment which seems to have paid better. The council also obtained through the Brighton United Football Club a reduction of fares in connection with the Saturday train. Further information is likely to be furnished by the company shortly.

VOLUNTEER EQUIPMENT FUND.—At the instance of the Lord Lieutenant the parish council undertook to support and collect for this fund, and have arranged for the sum of £14 gs. 6d. to be sent to the treasurer.

VILLAGE GREEN.—Some progress has been made in pursuing the necessary inquiries, but some time must elapse before the council assume effective control, because the legal difficulties are exceptionally technical and intricate.

WATER SUPPLY.—The last-named consideration applies to the water supply, so far as it is connected with the Green.—*East Sussex News*, 13th April, 1900.

The Parish Meeting.

In those parishes which are too small to have a parish council, there is always a parish meeting, which has nearly the same powers as a parish council. It was intended that all the house or cottage occupiers and other electors in these small parishes should meet now and then in the evening to discuss the parish affairs and decide what ought to be done. They could appoint committees for special purposes, and get new powers conferred on them by the county council. This seems to have been a failure in most places. The parish meeting has been held as a matter of form, to elect a chairman and two or more overseers. But in very few villages have the laborers, or the other electors, had any real discussion on the parish affairs. Very few parish meetings have obtained allotments or grazing land, recreation or burial grounds; hardly any have done anything about the charities, or looked after the footpaths, or improved the water supply. In over 5,000 parishes in England and Wales, where no parish council exists, nothing at all has been done by the people themselves. During the year 1906-7, out of 5,724 parishes without parish councils, only in 385 did the parish meeting spend anything at all.

But a few of these little parishes have done something. Some of them have applied to the county council and obtained the privilege of having a parish council. This should be done by every one of them. A few have asked the county council to group them with neighboring parishes, and so share in their councils.

In a few cases the parish meeting has itself managed the parish affairs, as it was intended to do. Thus the parish meeting of Kempsey (Gloucestershire, pop. 210) has hired five and a half acres of land for allotments, which it lets out to seven tenants. At

Barney (Norfolk) the parish meeting managed to get four and a quarter acres for this purpose, which is now let to 15 tenants. So in East Worldham (Hampshire, pop. 272) the parish meeting hires and manages four and a quarter acres, let to 13 tenants; and at Walberswick (East Suffolk, pop. 304) the parish meeting has five acres, let to 12 tenants. In one case, that of Clapton (Gloucestershire, pop. 103), the parish meeting, finding itself unable to get allotments in any other way, applied to its county council and got an order compelling the landowner to let it some land.

Some of these tiny parishes have improved their burial grounds. The parish meeting of Little Hale (Lincolnshire, pop. 270) laid out £92 in providing additional burial accommodation, and borrowed the money on a thirty years term. The parish meeting of South Newbald (East Riding of Yorkshire, pop. 166) borrowed and spent £150 in this way; and those of Wilshop (West Riding of Yorkshire), Gauthrop (North Riding of Yorkshire), North Redditch (Worcester), £68, £40, and £70 respectively.

How Parishes can get Greater Freedom and More Powers.

Nearly everywhere we find the complaint that the parish council has not got enough power. Many things it cannot do at all, such as manage the village school, though it appoints one of the six managers. Many other things it can do only by getting the consent of the rural district council, a body usually made up of farmers, who often object to do anything, however useful it may be, that costs money. But parish councils have actually got many abuses remedied by writing to the rural district council, and this should always be tried. Sometimes (as, for instance, getting compulsory power to hire or purchase land) the parish council has to go to the county council, which is a long way off, and not very willing to listen to a small parish. The law ought to be changed.

But even under the present law there are ways and means by which a parish can get more power and freedom to manage its own affairs. Many parishes have done so in the following ways:—

I.—THE PAROCHIAL COMMITTEE.

The parish council may ask the rural district council to appoint a "parochial committee," and to make the parish council that committee, with, perhaps, the addition of the district councillor for that district. Then the parish council (besides all its own powers) may exercise within its own parish nearly all the powers that the rural district council possesses, if they are delegated to the parish committee. The expenses for sewage and water supply will be kept separate, and will be charged on the parish in the poor rate; but for other matters they will be shared over the whole district, just as if there had been no parochial committee, unless the Local Government Board confers powers specially for one parish. Thus the Croydon Rural District Council (Surrey) every year appoints parochial committees for five of its parishes, consisting in each case of the members of the parish council, together with the rural district

councillors elected by the parish. These parochial committees, meeting in the parishes themselves, practically carry on the government, giving their orders direct to the rural district officials, and making formal reports to the rural district council, which are usually confirmed. The Liskeard Rural District Council (Cornwall) has followed the same plan with regard to all the parishes within its district. Another example is seen in Derbyshire, where the Parish Council of Ockbrook (pop. 2,567) got itself appointed the parochial committee for the parish. Some of the best governed parishes in the Bromley Rural District (Kent) are managed by parish councils acting as parochial committees.

II.—THE URBAN DISTRICT COUNCIL.

The parish council may apply to the county council to have the parish declared an urban district. The county council will send one or two of its members to hold a public inquiry in the parish, and if it is clear that the bulk of the people wish it, and if the parish is not too small, the county council will probably do what is desired. Then the parish elects an urban district council instead of a parish council, and gets quite free from any control by the rural district council. It can then build cottages, provide sewers and water supply, and manage the roads. It can go in for improving the parish in almost any way it chooses; but, of course, the parish will have to pay the cost in rates. An urban district council has practically the same powers as the town council of a small municipal borough. There are no aldermen, and the chairman is not called a mayor. But he is, during his year of office, a justice of the peace for the county; he can sit as a magistrate at petty sessions, and attend the general quarter sessions. There are many of these so called "urban districts" with fewer than 2,000 population, and quite rural in character. On the other hand, there are a score or two of parishes with between 5,000 and 15,000 population, which are apparently still contented to be under parish councils, and thus subject to the rural district council. There are some hundreds of parishes having more than 2,000 inhabitants in the same case. Every parish with a population of 2,000 or upwards ought to apply to the county council to be made into an "urban district," and so set free from the control of the rural district council. During the last 10 years a great many parishes, some of them quite small, have thus obtained self-government.

Conclusion.

The lesson of all this is that "where there's a will there's a way." If there is anything wrong in a parish, the parish council can do a great deal towards putting it right, *if only the right men are chosen*. If anyone wishes for further information on the subject, he should write to the Secretary of the FABIAN SOCIETY, 3 Clement's Inn, Strand, London, W.C.

MOTHER EARTH

PEOPLE OF ALL CLASSES and of all political parties are genuinely anxious to revive village life. Thus we may prevent the constant drifting of the people to the towns, with much concurrent misery. Everyone will therefore be interested to read "Mother Earth," by MONTAGUE FORDHAM, a thoughtful and practical book on this question.

It deals not only with the economic changes needed in order that a permanent life should be built up in the country districts, but also gives important information on co-operation, on the financing of small holdings through loan societies, and on agricultural education and productivity. The building up of a stable community of agriculturists and artisans in permanent country homes and the Land Club system, mentioned in this Tract, are also fully dealt with.

The book has been widely reviewed and highly praised. It can be obtained through all booksellers and from the Fabian Society.

A few press notices follow :—

The Economist.—"Mother Earth" should be read by all who are anxious to find remedies for the decay of agriculture.

The Globe.—Students will find much sense and ability in this short practical treatise.

The Church Times.—His book should be read by all who are concerned with the problem. It has the advantage of being a real book, written with a style.

The Manchester Courier.—It may be strongly recommended to the attention of all having any connection with the administration of the 1907 Small Holdings Act.

The Yorkshire Observer.—This book should be studied by land reformers of all shades of opinion.

The Manchester Guardian.—This beautifully printed essay has, as Mr. Hobson says, the conspicuous method of outlining a "large, bold, comprehensive and genuinely organic reform."

The Daily News says: The [Land Club] movement is so full of promise, because it has sprung voluntarily from the country people themselves. It is one of the very few efforts in modern rural England that can be called truly democratic. . . . Homes and land—that is the talisman that has called these clubs into being.

The Morning Leader.—A book so temperate and sane that all thoughtful people should read it.

The book is published in a special Library Edition, beautifully printed on deckle-edge paper at 5s. net, post free; and a Popular Edition will be issued in April at 1s. net, postage 2d.

MUNICIPAL TRADING.

PUBLISHED AND SOLD BY
THE FABIAN SOCIETY.

PRICE ONE PENNY.

LONDON :
THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.
JULY 1908.

THE FABIAN SOCIALIST SERIES.

'The first four volumes (all that are actually published) consist of revised, collected, and classified editions of some of the most valuable of the famous 'Fabian Tracts' in a style more suitable for the general reading public, and supplying in a handy and attractive form the best and most authoritative thought on 'What Socialism Means.' Each booklet contains not less than 96 well-printed pages, good paper and good type, and is supplied in two forms, i.e., in attractive wrappers at 6d. each, nett, and in quarter cloth boards, gilt top, at 1s. each, nett. Postage 1d. and 2d. each respectively.

VOLUMES NOW READY:

- I. **SOCIALISM AND RELIGION.** CONTENTS: (1) Christian Socialism, by the Rev. Stewart D. Headlam. (2) Socialism and Christianity, by the Rev. Percy Dearmer. (3) Socialism and the Teaching of Christ, by the Rev. John Clifford. (4) A Word of Remembrance and Caution to the Rich, by John Woolman, of the Society of Friends.
- II. **SOCIALISM AND AGRICULTURE.** CONTENTS: (1) The Village and the Landlord, by Edward Carpenter. (2) State Aid to Agriculture, by T. S. Dymond. (3) The Secret of Rural Depopulation, by Lieut.-Col. D. C. Pedder. (4) The Revival of Agriculture, by the Fabian Society.
- III. **SOCIALISM AND INDIVIDUALISM.** CONTENTS: (1) The Difficulties of Individualism, by Sidney Webb. (2) The Moral Aspects of Socialism, by Sidney Ball. (3) The Impossibilities of Anarchism, by G. Bernard Shaw. (4) Public Service *versus* Private Expenditure, by Sir Oliver Lodge.
- IV. **THE BASIS AND POLICY OF SOCIALISM.** CONTENTS: (1) Facts for Socialists, by the Fabian Society. (2) Capital and Land, by the Fabian Society. (3) Socialism: True and False, by Sidney Webb. (4) Twentieth Century Politics, by Sidney Webb.
- V. **THE COMMONSENSE OF MUNICIPAL TRADING.**
By G. Bernard Shaw. *Nearly ready.*

BALLADS AND LYRICS OF SOCIALISM. By E. Nesbit. Paper 6d. net (postage 1d.); boards 1s. (post. 2d.) A delightfully printed and attractively produced volume of verse written between 1883 and 1908. It fills a distinct gap in Socialist literature.

LONDON:

THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.

MUNICIPAL TRADING.

MUNICIPAL GOVERNMENT aims at improving the conditions of life in towns. Such improvement has already been effected to some extent and it may and ought to be carried much further. The undertakings by which it is accomplished may be divided roughly into two kinds: non-revenue producing and revenue producing. To the first category belong all those services for which no charge is made to the consumers as such, the cost being paid by the citizens by means of the rates. These are "unprofitable" in the ordinary commercial sense of the term. For instance, it costs money to destroy or disinfect a centre from which fever spreads; and though the ratepayer saves many pounds a year in doctors' bills in his own family and gains in the increased working power of his employees, he seldom thinks of crediting these gains and savings to the account to which he debits his rates. The municipalities themselves cannot estimate the savings and profits that result from people being alive instead of dead, or well instead of ill, and these items can never be brought into any statement of accounts which would satisfy the requirements of a "commercial audit." Much the largest part of all municipal expenditure is of this nature: paving, lighting and cleansing streets, maintaining order, collecting household dirt and refuse, housing and feeding destitute persons, educating children, making sewers and drains and keeping them in order, providing and maintaining parks and open spaces, roads and bridges—are all a general charge upon the community, it having been realized that the most satisfactory and often the only possible way of getting these things systematically done is by municipal action, and that the most convenient method of collecting the cost is not by fees but by rates. Expenditure on this work is liable to increase rapidly as soon as people realize that it really does not impoverish but enriches the community.

The Growth of Expenditure.

In the year 1884-5 the local expenditure in England and Wales for highways, education, poor relief, police, sewerage, lunacy and harbors (all non-revenue producing except the last two items, and those only repaying a part of the cost), amounted to about £29,300,000; and eighteen years later, in 1902-3, it had increased to about £44,000,000: that is to say, by about 50 per cent.; and these amounts include neither sinking funds and interest nor miscellaneous expenditure, which had gone up in yet greater proportion. The expenditure continues to grow year by year, but is not at all too great; for (apart from humanitarian considerations) the existence of infirmaries, workhouses and asylums makes life and

property safer ; and streets, roads, sewerage and harbors, as well as the industrial advantage of having a population able to read, write and cipher, are worth more than all we spend on them. But what is really unsatisfactory is that those who pay the rates are often not those who get the greatest benefit from them. A shopkeeper may be ruined and his family may have to go short of milk or boots because the rates on his shop are higher than his profits will bear ; and it does not console him to learn that the longevity of the community and the value of his landlord's property have greatly increased as a result of this municipal expenditure. It has to be admitted, therefore, that the present incidence of the rates is grossly unfair, and is rapidly becoming intolerable. The ground landlords in London, the value of whose land has been manifolded without effort on their own part, furnish an obvious instance of people who get too much from, and pay too little toward, municipal expenditure. No public advantage is secured by retaining a system which taxes some people unfairly to enrich others unjustly.

Revenue Producing Undertakings.

The second category of municipal undertakings, those which produce a revenue in fees or charges made for commodities supplied, constitute what is known as "municipal trading." For these undertakings a charge is made to the consumers who directly benefit by them, instead of upon the ratepayers at large. They generally yield a cash profit besides affording improved social services. It is customary to confine the term "municipal trading" to these undertakings ; but mention has first been made of the non-revenue producing work because it is the latter which causes the "high" rates and also a great part of those municipal "debts" often referred to as proofs that municipal trading is undesirable. The increase of rates, taking England and Wales as a whole, is due solely to expenditure on non-trading undertakings, of a kind indispensable to the very existence of healthy towns. Indeed, as will be seen later, municipal trading throughout the country, far from throwing any charge on the ratepayers, has resulted in a contribution being made towards the reduction of rates. As a matter of fact, the municipal "debt" of England and Wales, which in March 1905, already amounted to over £466,000,000, is to the extent of nearly £211,000,000 due to non-trading undertakings. The balance of over £255,000,000 is really capital in the commercial sense, being invested in enterprises which as a whole produce a cash profit or dividend.

Municipal trading easily pays its way, and could, indeed, be made to yield high cash profits were it desirable to do so. By charging as much for water, gas, electricity and tram-fares as private companies do, cash profits could be made out of municipal trading much larger than are usually made by private enterprises of a similar nature. The reason for not doing this is that the municipalities' aim should be not to make cash profits but to serve the public. In fact, it is not fair for a municipality to make large profits by charging high prices, because, as the profits go to the relief of the rates, those people who

travel often by municipal trams or use much municipal gas, water, or electricity, indirectly pay more in that case than their share of the cost of governing the town. That is why all municipal services ought to be run at, or nearly at, cost price. This is more or less the practice in many towns; and thus the opponents of municipal trading are able to declare that certain private companies earn larger profits than are earned by municipal undertakings. The latter charge little more than enough to cover their actual expenses, including the cost of renewal of plant, buildings, etc., plus interest on borrowed capital, and a sinking fund sufficient to repay that capital in a certain term of years; and people who do not ask what quality of service the public receives, nor at what price, nor how the employees are paid and treated, nor what hours they work, are consequently sometimes induced to believe that municipal trading brings no profit to the community: an opinion which will not stand examination.

As already suggested, many undertakings yielding great advantage to the community are of such a nature that private capitalists managing them are unable to secure any considerable profit in the form of dividends. In such cases, unless the work is done by a municipality, it is generally not done at all. For instance, the ultimate advantage to the community of destroying unhealthy dwellings in a congested slum, and arranging a fine open space where children can play and men and women who have been indoors all day can sit or stroll and breathe fresh air in the evening, may (by affecting the health and vigor of the population) be very great. The improvement may also so alter the aspect of the whole neighborhood that rents may go up and landlords may grow rich. But a man making the open space as a private speculation and trusting to the pennies he could charge for admission, or to the conscience-money that grateful landlords might send him, would find that he had made a very bad investment.

So strongly has experience shown that private companies cannot be trusted to supply the necessities of life in good quality, sufficient quantity, and at a fair price, that even under a Tory Government the powerful vested interests of the water companies of London were unable to maintain their independence and were compelled in 1904 to hand over their long-established businesses to the management of the community. This example is being, and will be, followed in other places and with reference to other commodities. In fact, already in 1902, out of the 317 municipal corporations in England and Wales, no less than 299 were carrying on revenue producing undertakings of one kind or another. These undertakings included waterworks, gasworks, electricity, tramways and markets, as well as baths and washhouses, burial grounds, working-class dwellings, harbors, piers, and a variety of other businesses.

It would be easy to select examples of extremely successful municipal enterprises; but it will be fairer and more convincing to take the most complete results that have been as yet published for several large classes of undertakings.

Public and Private Enterprise Compared.

The Board of Trade publishes annually returns of *every* gas undertaking and *every* tramway undertaking in the United Kingdom. The following summaries are prepared from these official figures by the *Municipal Year Book* (see pp. 461 and 472 of the 1908 issue).

GAS UNDERTAKINGS.

	All Local Authorities in U. K. 1905-6.	All Companies in U. K. 1905-6.
Average price charged per 1,000 ft.	2s. 5 $\frac{3}{4}$ d.	2s. 8 $\frac{1}{2}$ d.
Expenditure (ratio to income) ...	73·53	76·12
Return on capital	6 $\frac{1}{2}$ %	5%

TRAMWAYS.

	All Local Authorities in U. K. Year ending March 31, 1906.	All Companies in U. K. 1905.
Cost per mile of lines <i>laid</i> by L. A. and Companies respectively ...	£24,916	£28,072
Return on capital <i>worked</i> by L. A. and Companies	8%	4 $\frac{1}{2}$ %
Working expenses (ratio to income)	63·08%	66·28%
Average fare per passenger ...	1·08d.	1·20d.

ELECTRIC LIGHT AND POWER.

Unfortunately the Board of Trade does not at present issue returns relating to electric supply undertakings, and no absolutely complete statistics are obtainable. However, the *Electrical Times* publishes excellent tables relating to all undertakings of which it can obtain official statistics. With regard to local authorities its list seems fairly complete, the omissions being of no great importance. Its list of companies is unfortunately very incomplete. Still, the figures are not *selected* in any way, and probably are a fair sample of the whole. The following summaries are taken from the *Electrical Times* of May 2nd, 1908, p. 347.

London Undertakings.

	12 London Local Authorities 1905-6.	13 London Companies 1905.
Average price per unit	2·63d.	3·08d.
Working expenses per unit... ..	1·28d.	1·55d.
Gross profit per cent. of capital ...	5·69	6·53

Provincial Undertakings.

	196 Provincial Local Authorities 1905-6.	70 Provincial Companies 1905.
Average price per unit	2·08d.	2·71d.
Working expenses per unit... ..	0·99d.	1·47d.
Gross profit per cent. of capital ...	7·15	4·79

PRICES CHARGED TO THE PUBLIC.

It will be noticed that in each one of these public services the prices charged to the public by local authorities are lower than those charged by companies.

COSTS OF PRODUCTION.

It will also be seen that in each service, without exception, the working expenses of the public authorities are lower than those of the companies. In the case of gas and tramways, the figures in the *Municipal Year Book* do not reveal the full extent of the difference in favor of the former. Thus in the case of gas, the average price charged by the local authorities is 2s. 5 $\frac{3}{4}$ d. per 1,000 cubic feet, and their average expenditure 73·53 per cent. of their income. Now it is clear that if they charged the same price as the companies (*i.e.*, 2s. 8 $\frac{1}{2}$ d.) their income would be much higher, and their expenditure would therefore be very much less than 73·53 per cent. of that income. The same applies to tramways.

AVERAGE PROFITS.

It will be noticed also that in each service the average rate of profit of the public authorities is higher than that of the companies, except in the case of the London electricity undertakings. This exception is explained by the fact that in London the companies have the best districts and the largest undertakings, and have been much longer established.

It should be remembered that in addition to the large sums which are every year transferred from the profits of public undertakings to the relief of the rates, the public makes a large indirect profit in consequence of the lower prices charged. This indirect profit amounts to several million pounds per annum.

These figures conclusively disprove the statement so often made that municipal trading does not pay, and that it is extravagantly and wastefully conducted. They prove beyond doubt that at the present time public enterprise can and does give a cheaper service than private enterprise; that it is more economically and efficiently conducted; and that it is more profitable.

If private electrical enterprise were to be judged as a whole, debiting it with interest and sinking fund on all its wound-up unsuccessful companies as well as its successful ones, it would come out of the test far worse than in the tables given above. The private company, with its limited liability, may simply spend its shareholders' money and stop payment when it fails. It may "cut its losses," and ruin its investors. Whereas every sum borrowed for municipal enterprise must be paid back to the uttermost farthing; and until it is paid back the interest on it must be paid punctually, whether the enterprise pays its way or not.

Workmen's Dwellings.

Some charge on the rates has been incurred over the construction of working-class dwellings. According to the Parliamentary Return

to March 31st, 1902 (the latest authoritative statement available), capital to the amount of over £1,253,000 had been expended on these, of which about £207,000 had been paid off or balanced by sinking fund. The average yearly income, after paying working expenses, was £16,500 ; while the amount required for interest and repayment of capital was £43,500, so that the contribution from the rates was nearly £27,000 a year.

It must, however, be borne in mind that in the matter of supplying workmen's dwellings private enterprise has also failed. The overcrowding of the people, both in towns and villages, is the greatest scandal of our time. The census Returns show that nearly one-third of our total population, and in London alone nearly 1,000,000 people, live in an overcrowded condition. Over two hundred thousand Londoners are packed in horrible block dwellings, nearly half a million live three persons to a room, and thousands live in still more crowded conditions. The state of things in many rural districts is quite as bad.

The action of the municipality in this matter is almost confined by law to insanitary areas and to workmen's dwellings. A private builder is under no such restriction. He can take an order for a cathedral and for a potting shed, for a millionaire's house in Park Lane and for the cottage of the millionaire's gamekeeper. In the intervals between large contracts he can keep his staff and plant employed on small ones. If he decides to go into the business of housing the working classes, he can proceed much more cheaply than the municipality. Instead of erecting huge blocks of dwellings with fireproof floors and all the solidities and sanitary appliances of what may be called parliamentary building, he may "run up" rows of small private houses, which will presently become lodging houses ; or he may adapt the family mansions of a neighborhood deserted by fashion, for occupation by working class families.* Under these conditions there can be no question of a commercial or any other test : comparison is impossible. The municipality is compelled to take the refuse of a trade and to carry it on in the most expensive way : the private builder has the pick of the trade, and can adapt his expenditure to the pecuniary resources of the tenant. Moreover the Local Government Board, when it grants a local authority a loan with which to erect houses, always insists on much more stringent conditions as to building than are contained in the ordinary bye-laws.

Other Undertakings.

We come finally to a group of undertakings which, though they are revenue producing in the sense that the public pays *something* for the use of the facilities provided, are still not generally expected to earn as much as they cost. To this group belong baths, washhouses, burial grounds, harbors, piers, docks and quays. It can hardly be necessary to demonstrate that it is better to give the poorest part of

* By law a municipality can build shops on building estates, and adapt existing houses for working class occupation. In practice these powers are rarely made use of.

the population opportunities to wash themselves and their clothes, even though they cannot afford to pay the full cost of the baths and laundries. With reference to dead bodies also, it is obviously more important to get these disposed of quickly and safely (though our cemeteries often fail to do this) than it is to try to make every municipal cemetery pay as well as some do. Similarly with harbors, piers, docks and quays. The Town Council of Penzance, for instance, may very reasonably decide to promote the trade and prosperity of the town by dredging and by repairing the dock gates, even though this for a time involves a contribution from the rates of some hundreds of pounds a year. The gain they look for is an indirect gain, or a gain only realizable in the future.

The total figures for this last group of reproductive undertakings—baths, cemeteries, harbors, etc., according to the same Parliamentary Return, are: Total capital expended, £9,792,000, of which over £2,815,000 had in 1902 been repaid or balanced by sinking funds. The yearly income—after deducting working expenses—was about £105,000. The amount required for interest and repayment of capital was over £371,000, and the consequent annual charge on the rates was about £266,500.

Such undertakings as the London municipal steamboats should not be judged merely by their financial results. Whether such boats should be run at a financial loss is a matter of opinion which ought to be decided by comparing the cost, on the one hand, with the gain to the population in health or pleasure, and the advantage accruing from relief to the street traffic, on the other. There are many services a municipality might provide, the advisability of which depends partly on what the city can afford, and partly on considerations only remotely connected with wealth.

The scope of municipal trading is not limited to the undertakings about which figures have been quoted in the foregoing. The Parliamentary Return already alluded to mentions "other reproductive undertakings" on which a capital of £714,000 has been expended, of which more than £150,000 had been paid off or provided for by sinking funds. The yearly surplus for these, after deducting working expenses, was about £48,500. The amount used for interest, repayment of capital, and set apart for depreciation, was about £33,200 a year, and the average annual net profit for four years was over £15,300.

The Manchester Ship Canal was accomplished thanks to the financial support of the Manchester Corporation. Liverpool and Glasgow provide municipal lectures, Battersea has a municipal young men's club, many towns provide municipal concerts, others have pleasure piers, Torquay owns a rabbit warren and makes a profit on it, Colchester owns an oyster fishery, St. Helens and several other towns have sterilized milk depôts, Hull manages a crematorium, the Gloucestershire County Council even runs a canal, Doncaster owns a racecourse, Bournemouth provides golf links for visitors, Harrogate fireworks, West Ham runs a paving stone factory, Bradford owns an hotel, scores of municipalities own property

of various kinds, while some of them execute their own works and directly employ thousands of workers.

In reckoning the advantages of municipal trading it must be remembered that the charges to the public for the service of water, gas, electricity, trams, and other public services, are usually lower than those of private companies; the people employed are usually better paid, better treated, and work shorter hours; those who lend money for the undertakings receive their interest regularly; there are no bankruptcies; and an incalculable amount of anxiety, uncertainty and friction is thus saved to the people concerned, and indirectly to those who depend on them or work for them.

These municipal undertakings are, year by year, repaying the capital invested in them, so that in time the plant will belong to the towns free of debt. They will then, if they have been kept in good condition out of revenue, as is generally being done, either produce a larger income in relief of rates or be able to supply services still more cheaply. It will be as though limited liability companies accumulated reserves sufficient to pay off their capital, and thereafter reduced the price of their goods or presented the public with all the profits they earned.

What then are the objections we hear so much of to the principle of municipal trading?

Those usually put forward are:—

1. That town councillors are not competent to manage them; and sometimes, on private grounds, appoint men to public posts for which they are quite unsuited;

2. That such undertakings increase municipal debt and add to the burden of the rates;

3. That it is "unfair" of municipalities to compete with private companies;

4. That new inventions may some day render the undertakings worthless;

5. That there is a risk of the municipal employees so using their vote as to obtain unfair advantages for themselves; and

6. That municipal accounts may be cooked to deceive the public.

Let us see what these objections are really worth.

Objection I.—The Competence of Councillors.

First, the importance of management as a factor in industrial success cannot easily be exaggerated; but management is nowadays as completely dissociated from ownership as machinery, and almost as easy to buy in the market. Nobody now suggests that a railway company is an impossibility because railways cannot be managed by a mob of shareholders, even when they act through committees of directors who do not know a piston rod from a trunnion. The directors simply prescribe the result they wish to obtain, and engage a staff of experts to tell them how to obtain it. Thus the London and North Western Railway Company manufactures everything it wants, from locomotives to wooden legs, without the inter-

vention of a contractor. A mob of ratepayers acting through a municipal authority is in precisely the same position. The ratepayers are just as stupid and short-sighted as ordinary joint stock shareholders, and the worst of their representatives on the municipalities are as incapable as the worst ordinary guinea-pig directors. But the ratepayers and councillors light their towns with electricity, run tramway services, build dwellings, dredge harbors, erect dust destructors and crematoria, construct roads, and manage cemeteries, as easily as a body of clergymen's widows can lay an Atlantic cable if they have money enough, or an illiterate millionaire start a newspaper. The labor market now includes an ability market in which a manager worth £10,000 a year can be hired as certainly as a navvy.

In spite of the fact that municipalities as yet move but slowly, and that an energetic man sometimes chafes in their employ and prefers to enter a private firm, it may yet be truly said that, on the whole, in the ability market the municipalities have a decisive advantage in the fact that prudent and capable organizers and administrators prefer public appointments. A municipality can always get an official more cheaply than a company can. A municipality never becomes bankrupt, is never superseded by a new discovery, and never dismisses an official without giving his case prolonged consideration in committee, from which he has practically an appeal to the whole body. A man who behaves himself and does his work has nothing to fear in public employment: his income and position are permanently assured. Besides, he enjoys his salary to the full; he has no appearances to keep up beyond the ordinary decencies of life; he need not entertain, need not keep equipages or servants for purposes of ostentation, may travel third class if he likes, and belong to what sect he pleases or to no sect; and this is why the ratepayers, in spite of their stinginess in the matter of salaries on the professional scale, get so much better served than they deserve.

If this answer does not satisfy you, turn to the actual results attained. The fact is, that town councils are generally managing their undertakings better, from the point of view of the public, than private capitalists have done. London's municipal trams compare favorably with the private companies' trams. The Manchester municipal gas supply compares favorably with Liverpool's private gas supply. The profits of a private gas company go, however, into the shareholders' pockets, with the result that in Liverpool a few people have a strong interest in upholding "private enterprise" (that is to say, their own profit), while in Manchester many people reap an advantage from municipal ownership. But as a few people making large profits can combine more effectively than many people reaping small advantages, the money and energy spent in attacking municipal trading is much greater than the money spent in showing the evils of private enterprise. As to the admitted fact that the public welfare is sometimes sacrificed to private considerations by elected persons of a certain type when they are not restrained by publicity and their dread of the electors, this is clearly not a

sufficient reason for substituting the unrestrained and irresponsible private "boodler" for the restrained and responsible public one, though it is a strong reason for arousing a deeper and more general appreciation of the extreme importance of choosing reliable men at local elections.

Objection II.—The Burden of the Rates.

The second objection, that such undertakings increase municipal debt and add to the burden of the rates, is absurd. The latter part of the statement is untrue; for, as already stated, municipal trading has reduced the rates by earning a net profit. The increase of municipal debt for revenue producing undertakings is merely the increase of capital usefully and productively employed; and the country would be worse instead of better off had this capital been raised by private companies instead of by municipalities. One of the weakest pleas employed by advocates of private profit-making is to call the money raised to start a private gas company "capital" and to speak of it as an indication of wealth, while calling the money raised to start a municipal gas works "debt," and regarding it as a sign of impending ruin. A real difference between the two is that the municipality arranges to pay off the money it borrows within a fixed term of years, whereas the private company wants to charge the public to the end of all time with interest and profits on the capital invested.

Objection III.—Unfair Competition.

As for the third objection there is, in one sense, a good deal to be said for the contention that private enterprises have not a fair chance in competition with municipal enterprise; for we have already seen that a municipality can get its skilled managers more cheaply than a private company can, and it is equally true that it can borrow its capital on better terms. Any of our large corporations can raise as much money as they need at less than 4 per cent.; and no private companies can get money at so low a rate. This is the central commercial fact of the whole question. The shop-keeper, by municipal trading, can get his light for little more than the current cost of production plus the rate of interest paid by gilt-edged securities, because municipal loans are accepted by the investing public, and the municipal stock of towns with over 50,000 inhabitants is regarded as a legitimate security by the law of trusteeship. Any profit that may arise through accidental overcharge returns to the ratepayer in relief of rates or in public service of some kind. Moreover, when a private company starts, it may be ruined by an accident or a miscalculation which prevents it from completing its undertaking with the capital at its command, whereas a municipality is in no such danger.

It is therefore true enough that private enterprise can only compete with municipal enterprise if it happens to have some unusual advantage in the special ability of its organizer, or if it controls valuable patents or other rights. It is also true that a small shop-

keeper cannot compete with a universal provider, or a horse-cab company with a taxicab company, or a ferryman with a bridge-builder, or the Belgian army with the German army. That may be "unfair"; but does any sane person propose to suppress universal providers or taxicabs or bridges or the German army for the sake of the small shopkeepers and horse-cabdrivers and ferrymen and Belgian soldiers? There is no other sense in which municipal trading is unfair. It is *better*. Yet the very people who complain of this superiority try to persuade the public at the same time that private enterprise is superior to it. It would, in fact, be unfair to the community if the municipality failed to make use of its advantages.

In the demand for handing over to private firms the work that the municipality can do more economically itself, we reach the root of the controversy about municipal trading. A large part of that section of English society which is capable of expressing itself intelligibly aims at arranging matters so that some people (whom we will call A) shall work for others (whom we will call B) under conditions which ensure a flow of money into the pockets of class B; and any attempt to get the work of the community so organized that there shall be no "profit," but that class A shall be fairly paid, and the services shall be supplied to the consumers at about cost price, appears to class B to be a foolish waste of opportunities Providence has supplied for the exploitation of the public.

As soon as one has grasped this, the controversy becomes intelligible. One sees why some people talk nonsense and others listen to it greedily; and one understands why the newspapers, controlled by the capitalist class, are so bitterly opposed to municipal trading.

Objection IV.—New Inventions.

As to the fourth objection, relating to new inventions, it is a penalty attaching to man's fallibility that when he has done the best that the science of his day indicates, the results of his efforts may have to be thrown upon the scrap-heap because his successors may know how to get better results by quite other means—as stage-coaches and semaphores were scrapped by railways and telegraphs. But this is no reason for avoiding municipal action. In few branches of industry has invention been busier and scrapping more frequent than in electric lighting. Yet our municipal electric plants are as much up to date as the private ones. And the advantage of the municipality is that though it can be benefited by a new invention, it cannot be ruined by it. The path of progress by private enterprise is strewn with bankruptcy, lunacy, and suicide. The ruin which overtakes certain sections of the population when inventions are left to the wild scramble of speculators, company promoters, and ignorant investors, would stagger our anti-municipalizers if it could be estimated in figures. Municipal enterprise need ruin nobody. It simply adopts the new method at the point at which its plant for the old method is worn out or costs less to scrap than to maintain. It has no prejudice against new methods: on the contrary, municipal engineers have to spend more time than

they like in making reports in answer to members enquiring about such methods. And when a municipality effects an improvement in method, it has no motive to keep it a secret. It at once gives the whole community the benefit of its ability and experience without charge. Secrecy and monopoly are of no use to it. To reduce the rates or the charges to the public by improvements in machinery or organization is the feather in its cap which it most covets; it is the surest way of gaining votes at the next election. The position of private ventures is very different. Some fresh application of electricity may ruin the gas companies; petrol-motors may ruin horse-bus companies; steam-motors may in turn ruin petrol-car companies, only to be themselves ruined a year later by electric-motors, and so on, till flying-machine companies ruin all the rest, and are in their turn wrecked by improvements as yet undreamed of, spreading dismay and ruin among thousands of innocent victims.

Objection V.—Employees' Influence.

As to the fifth point, the risk of municipal employees using their votes to obtain unfair advantages, it is conceivable that an active organization of municipal employees may some day play as selfish a part in municipal elections as that now openly played by those interested in commercial companies, though it is impossible for them to play an equally harmful one. But at the present time those who do much of the most necessary work, under the hardest conditions and for the poorest pay, have hardly any voice in settling the conditions under which that work shall be done. Surely it is the latter fact, and not the former possibility, that is the greater evil. The municipal employee is also a ratepayer: he is, in fact, his own employer, and, if he cheats his employer, cheats himself. It is true that if he is, say, a mason or bricklayer, he may try to push the municipality into excessive building. But he would have the same motive if the building work was given out to private contractors. Besides, all municipal employees do not belong to the same trade. As more and more members of the community become municipal or governmental employees, the problem will more and more be, how is the community to utilize the resources of the country and divide the work so as to obtain the best results with the least injury to the workers?

Objection VI.—Cooked Accounts.

With reference to the sixth point, the danger of the public being deceived by the way in which accounts are presented, it should be obvious that work professedly done for the benefit of the community, and properly exposed to continual criticism in the town councils and in the public press, is less likely to be accounted for in a way calculated to deceive the public than work admittedly undertaken primarily to enable certain shareholders and capitalists to make as much profit as possible for themselves. As a matter of fact, many authorities have done more than is demanded by the law, and have appointed professional auditors to check their accounts.

The six objections to municipal trading have now been considered ; but certain points calling for further comment arise from what has been said.

The Question of Character.

Municipal trading is one of the chief means whereby the social and economic evils of our day can be met ; but it is not a self-acting method. It depends always for its success on those who work it and on the community among whom it works. When all is said and done, municipal trading remains a machine by which men of capacity and goodwill can co-operate ; but the motive power to drive the machine must be generated in the hearts and minds of human beings.

It is obvious that very much depends on the selection of municipal councillors, and it has already been pointed out that it is an urgent duty of citizenship to support and encourage those who are both able and willing to give good service to the public. The men best qualified for the work are often those who are reluctant to undertake it, for a man really qualified for the post knows how difficult and responsible public work is.

It would, therefore, probably be wiser for the community to pay its municipal councillors, for it would then have a larger choice of candidates, and could be more stringent in its demands upon them. We have in this respect much to learn from Germany, where men of ability who make the work of municipal government their profession are elected mayors of towns, and are well rewarded both in money and honor.

Other Considerations.

Very important matters in comparing municipal trading with private trading are the question of the minimum wage, and the disadvantage (unless everyone employed by the contractor receives a full living wage) of contracting out work the municipality could reasonably do themselves.

This, and the important and not generally understood allied question of parasitic industries, is dealt with in Mr. and Mrs. Sidney Webb's "Industrial Democracy"; and an admirable summary of their argument is given in Bernard Shaw's "Common Sense of Municipal Trading," to which (as well as to Tract No. 128, on the Legal Minimum Wage) the reader is here referred, lack of space preventing us from dealing adequately with the subject.

Desirable Extensions.

Among the services municipalities might in the near future undertake or greatly extend much to the advantage of the public are Electric Power (Tract No. 119), the Milk Supply (see Fabian Tracts Nos. 90 and 122), Slaughterhouses (Tract No. 92), the Drink Traffic (Tract No. 86), Hospitals (Tract No. 95), and Pawnshops (Tract No. 91), not to mention many other things.

It needs no long argument to prove that the community has a stronger reason for wishing to obtain its supply of milk pure and as

near cost price as possible than any private trader can have for wishing to supply it in that condition and at such a price. It is equally evident that the milk supply of a whole town can be more economically organized if it be centralized than if it be left to the haphazard competition of a dozen or a hundred private dealers, several of whom may be sending their carts every day in competition with one another along the same streets. Similarly it is more to the interest of a community to slaughter only healthy animals for human consumption, and to do this as far as possible under cleanly conditions, than it can be to the interest of private slaughterers. Again, with the supply of coal, it is to the interest of mine owners and coal dealers that the difference between the cost of obtaining the coal and the price paid by the retail consumer should be large; but it is to the interest of the community to have coal supplied as nearly as possible at the price it costs, which could be done by nationalizing the mines and municipalizing the local distribution.

The Limits of Municipalization.

It must, however, on no account be supposed that it is desirable for our town councils to municipalize everything.

If the medical officer of health wants a microscope or the county surveyor a theodolite, it will not pay the municipality to set up a scientific instrument factory to produce that single article, possibly of a kind which can be produced by half a dozen firms in sufficient quantity to supply the whole of Europe. Even the London County Council, with all its bands, has never proposed to manufacture its own trombones. The demand for the commodity must be sufficiently extensive and constant to keep the necessary plant fully employed. The moment this limitation is grasped, the current vague terrors of a Socialism that will destroy all private enterprise laugh themselves into air. The more work the municipality does, the more custom it will bring to private enterprise; for every extension of its activity involves the purchase of innumerable articles which can, in the fullest social sense, be produced much more economically by private enterprise, provided it is genuinely self-supporting, and does not sponge on the poor rates for part of the subsistence of its employees; in short, provided it works under a "fair wages" clause.

A very serious and quite artificial obstacle to municipal trading, as has been already indicated, is presented by the limits within which the activity of each separate borough is confined. In the country, municipal enterprise is reduced to absurdity by the smallness of the areas and their openly nonsensical boundaries. Mr. H. G. Wells's description (in "Mankind in the Making") of his residence on the boundary between Sandgate and Folkestone (two places as continuous as Mayfair and St. James's), a boundary which no municipal tramcar can cross, shows the hopelessness of substituting public for private Collectivism there. A shipping firm whose vessels were forbidden to cross any degree of latitude or longitude might as easily

compete with the Peninsular and Oriental as the Folkestone municipality with a trust which could (and would) operate over a whole province.

In towns the nuisance of antiquated boundaries is equally flagrant and often financially much more serious. But evidently this is a difficulty which can be dealt with as soon as public opinion is educated up to the point of wishing to have it altered, a process which will probably be assisted by the success of various large trusts in crushing small competitors and monopolizing large industries for private profit. In America the Standard Oil Company and other large combines have done more than any Socialist arguments to open people's eyes to the evils resulting from industrial competition, or rather from that stage of economic progress which is rapidly replacing competition by combination, and which, while it does away with the inefficiency and wastefulness of the small, old-fashioned and incompetent trader, introduces its economies and improvements not for the benefit of the public (though incidentally they may get some crumbs of advantage) but for the gain of the capitalist.

The Evils of Private Trading.

It will also be assisted by a growing appreciation of the evils which accompany private trading. The wastefulness of private competition is so obvious that the average town councils would have to be worse than Tammany Hall ever was before a community could reasonably prefer to entrust its public services to the private trader. For though Tammany bosses made fortunes at the public expense by corrupt means they were at least capable and efficient business men ; nor did they upset the industrial and economic life of the community as it is upset by speculators of the type of Whitaker Wright or the Directors of the City of Glasgow Bank.

In comparing private with municipal trading one has to bear in mind the indictment of ordinary commercial trades made by Sir Edward Fry, late Lord Justice of Appeal, who said : " If one enquires whether the morality exercised in the conduct of business in this country is satisfactory or not I fear the answer must be in the negative. Let me enumerate some well known facts :—

" 1. Over-insurance of vessels when one considers how nearly this sin approaches to the crime of murder this consideration is startling.

" 2. The bad and lazy work too often done by those in receipt of wages.

" 3. The adulteration of articles of consumption.

" 4. The ingenuity exercised in the infringement of trade-marks, and the perpetual strain exhibited by rival traders by some device or other to get the benefit of the reputation and name of some other maker.

" 5. A whole class of frauds exists in the manufacture of goods, by which a thing is made to appear heavier or thicker or better in some way or other than it really is. The deceit is designed to operate on the ignorant ultimate purchaser.

"6. Lastly, but not least, bribery in one form or the other riddles and makes hollow and unsound a great deal of business."

Add to this that a Special Committee of Enquiry of the London Chamber of Commerce reported :—

"Your committee conclude from the evidence before them that secret commissions in various forms are prevalent in all trades and professions to a great extent, and that in some trades the practice has increased and is increasing ; and they are of opinion that the practice is producing great evil, alike to the morals of the community and to the profits of honest traders."

One has also to bear in mind that the late Lord Chief Justice Russell, addressing the Lord Mayor in 1898, described company fraud as "a class of fraud which is rampant in this community—fraud of a most dangerous kind, widespread in operation, touching all classes, involving great pecuniary loss to the community, a loss largely borne by those least able to bear it ; and, even more important than this, fraud which is working insidiously to undermine and corrupt that high sense of public morality which it ought to be the common object of all interested in the good of the country to maintain—fraud blunting the sharp edge of honor and besmirching honorable names."

It would be easy to continue this indictment of present day methods by reference to the condition of many of the workers and the elaborate deception of consumers by enormously expensive advertisements, on the production of which a not inconsiderable portion of the energy of our population is wasted. Many of these advertisements are mischievous and dangerous as well as wasteful, leading people to depend on drugged or innutritious foods, on tyres falsely alleged to be non-skidding, on quack medicines, etc., etc., etc.

Experience shows that it is difficult to insist on a high standard of morality in war time ; but to take the case of the South African scandals as a typical instance, we find that the twelve ounces to the pound jam came from private, and not from government, factories.

The Incidence of Rates.

Something still remains to be said about a matter referred to at the commencement of this Tract, namely, the incidence of the rates. The progressive mayor of one of our large towns felt tempted to declare not long ago that municipal improvements should be stopped until the right to rate ground values had been obtained ; for, said he, what is happening here and in other places ? We are heavily rating our people in order to make roads and pave streets, and supply gas, water, and trams. The effect is to send up the price of the land we reach. Now a few years hence we shall have to buy parts of that land at a much higher value for schools, parks, open spaces, post offices, etc., etc. Then the very people who have paid the high rates expended on giving the increased value to what was agricultural land, will have to pay higher rates to buy it back at its enhanced price.

In reply to this it will be said that what happens is that the increase of rates really comes instead of an increase of rent, and that in this way ground landlords are already contributing largely to the rates; that, in fact, the present system is a rough way of taxing rent. And it really does so when the tenant is rackrented to the last farthing; but then very few ratepaying tenants are so rackrented. If the tenant would at a pinch pay another two pounds a year, say, sooner than move (a pretty common case, one guesses), he is, from the economist's point of view, enjoying two pounds a year of the rent; and if his rates go up by two pounds he will not be able to shift the increase on to his landlord. All that will happen is that his rent will become a rack-rent instead of falling two pounds short of it. The rate collector takes what the landlord spared.

The remedy is to tax all whose incomes are unearned; not the ground landlords exclusively, though, as a class, they gain most by municipal expenditure, and it is they who should pay the greater part of the local rates. When it comes to a question of national taxation, on the other hand, there is no reason why those who have large incomes from Consols or shares in industrial enterprises, should not also bear a large part of the burden; for they benefit from the maintenance of army and navy, police, etc., quite as much as the owners of the land.

The Last and the Next Generation.

The efforts of our forefathers during the last 150 years have solved one half of the economic problem. Man has obtained such a mastery over matter that it would be easy to-day to organize the labor of the inhabitants of this country so that all might be well fed, clad, housed and trained. It remains for us to accomplish the other half of the problem by arranging the production and distribution of wealth so as to minimize waste, and by making it difficult for the crafty to exploit the simple, to make it easy for all to obtain a fair share of the produce of their own labor and of the fruits of the organized efforts of the community.

In the gradual accomplishment of that task municipal trading can perform a large and useful part when once the question is properly understood and elections so conducted that public spirit and business capacity meet on our municipal councils.

Municipal trading has its limits. Some services, such as the railways, should not be municipalized but nationalized; and, as already indicated, there is no reason why ample scope should not be left for individual enterprise. But the reasonable limits of municipal trading have not yet been approached, even in our most progressive cities.

[Free use has been made of Bernard Shaw's "Common Sense of Municipal Trading" and R. B. Suthers' "Mind Your Own Business" in preparing this Tract, and many passages have been borrowed from those works.]

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. Paper cover, design by A. G. Watts. 3d., post free 4d.; 2/3 per doz., post free, 2/7.

FABIANISM AND THE EMPIRE: A Manifesto. 1s. net.

FABIAN ESSAYS IN SOCIALISM. (43rd Thousand.)

Paper cover, 1/-; plain cloth, 2/-, post free from the Secretary.

FABIAN TRACTS and LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 78, 3s.; post free 3/5. Bound in Buckram, 4/6; post free for 5s

I.—General Socialism in its various aspects.

TRACTS.—138. Municipal Trading. 121. Public Service versus Private Expenditure. By Sir OLIVER LODGE. 113. Communism. By WM. MORRIS. 107. Socialism for Millionaires. By BERNARD SHAW. 133. SEPTEMBER 1908.

SOCIALIST REVIEW

A Monthly Review of Modern Thought. 6d. net.

The objects of the SOCIALIST REVIEW are:—1. To discuss the theories and policy of Socialism. 2. To describe sociological and industrial changes of interest to Socialists and Social Reformers. 3. To examine modern tendencies in legislation and commerce. 4. To present a Socialist view of current social, industrial and political events.

To all students of modern social, political, economical and industrial problems
THE "SOCIALIST REVIEW" IS INDISPENSABLE.

The contributors include:—Dr. Alfred Russel Wallace, H. G. Wells, Richard Whiteing, Walter Crane, Sidney Webb, Edward Carpenter, Philip Snowden, M.P., J. R. MacDonald, M.P., J. Keir Hardie, M.P., L. G. Chiozza Money, M.P., Margaret McMillan, Sidney Ball, Rev. A. L. Lilley, Rev. C. L. Marson. Also K. Kautsky, E. Bernstein (Germany), J. Jaures (France), E. Vandervelde (Belgium), V. Adler (Austria), and many of the prominent Colonial Socialists and Labour Leaders.

Vol. I (March-August), bound in red cloth, lettered in gold, 3s. 6d. net, postage 5d. extra. Binding Cases for Vol. I, 1s. net, post free.

From all Newsagents and Bookstalls, or direct from the I.L.P., 23 Bride Lane, Fleet Street, London, E.C.

Subscription Terms, 7s. 6d. per year, or 2s. per quarter, post free.

SOCIALIST REVIEW

The Socialist Library.

VOL. I.—SOCIALISM AND POSITIVE SCIENCE. By ENRICO FERRI.

VOL. II.—SOCIALISM AND SOCIETY. By J. RAMSAY MACDONALD, M.P.
Daily Chronicle: "Well written, logical, and readable, and we commend it to the study of all social reformers."

VOL. III.—STUDIES IN SOCIALISM. By JEAN JAURÈS.

Review of Reviews: "Well worth reading by English Socialists and others who wish to keep in touch with the movement on the Continent."

VOL. IV.—WHITE CAPITAL AND COLOURED LABOUR. By SYDNEY OLIVIER, K.C.M.G.

VOL. V.—COLLECTIVISM AND INDUSTRIAL EVOLUTION. By EMILE VANDERVELDE.

Manchester Guardian: "One of the cleverest, most logical, and most representative accounts of modern European Socialism."

VOL. VI.—SOCIALISM AND THE DRINK QUESTION. By PHILIP SNOWDEN, M.P.

Sheffield Independent: "This little volume may be commended for study as an example of moral earnestness and a sense of responsibility in Socialist propaganda."

EXTRA VOL. I.—THE REVOLUTION IN THE BALTIC PROVINCES OF RUSSIA. Sixteen illustrations.

Cloth, 1s. 6d. net.

Paper covers, 1s. net.

Postage 3d. extra.

May be obtained from all Booksellers, or direct from the Publishers—

**The I. L. P. PUBLICATION DEPARTMENT, 23 BRIDE LANE,
FLEET STREET, LONDON, E.C.**

SOCIALISM AND THE CHURCHES.

AN ADDRESS GIVEN AT THE BAPTIST CHAPEL, FOREST HILL, LONDON, TO THE LONDON BAPTIST ASSOCIATION ON JUNE 30TH, 1908, BY JOHN CLIFFORD, M.A., D.D., AND REPRINTED BY PERMISSION FROM THE "WESTBOURNE PARK RECORD."

THE word "Socialism," it will be remembered, came into use about the year 1835—a little more than seventy years ago—as descriptive of the heroic and self-sacrificing efforts of Robert Owen for the improvement of the social and domestic conditions of the workers of this country. It was descriptive of an endeavor to displace the fierce and disastrous competitive methods and conditions of industrial life by the introduction of co-operative and organized action based on justice and intended to promote the general welfare.

Socialism is a movement, and not merely a theory or a set of theories. It is of the first importance that we should regard it in that light, so that we may not be entangled in the various speculations which have sought shelter under the Socialistic label, or be misled by the sophisms and vagaries of some of its advocates, or blinded by the prejudices and falsehoods of some of its antagonists.

Primarily, it is a movement in the Social State, as "Modernism" is a movement in the Roman Catholic Church, or as Puseyism was an ecclesiastic movement, originating about the same time as Socialism, within the Anglican Church, or as the Evangelical Revival was a religious movement in the eighteenth century. Essentially Socialism was, and is to be judged as, *a movement, a tendency, a pushing forward of the inner soul of humanity towards its predestined goal.*

Now, as a movement it has a governing idea and a practical method, but the vital element is its *spirit*. Socialism is a spirit of justice and charity, of broad sympathies and general goodwill, of universal amity and benevolence, of service to others and not of getting for self. H. G. Wells, in that most illuminating and enriching book, "New Worlds for Old," says: "Socialism, as he understands it, is a great intellectual process, a development of desires and ideas that takes the form of a project—a project for the re-shaping of human society upon new and better lines." It is that; but it is more. It is an ethical and religious effort, proceeding from within the soul of the human race, for pulling down principalities and powers, and spiritual wickedness in high places, and bringing every thought of man into captivity to the obedience of the teaching and spirit of Jesus Christ, the Savior and Leader of men.

But whereas there is no doubt as to the spirit of Socialism, its working idea is not so easily caught or readily expressed. It is too early in the history of the movement, and its development as an idea is too infantile, for us to define it with accuracy and adequacy. Moreover, the idea takes the form of the political mould in which it is cast, and therefore we have one expression of it in Germany, another in France, and another in England. "The Encyclopædia of Social Reform" just published, after giving a long string of definitions from different authors, sums up the result in which they agree, thus: "Socialism may be said to be *the collective ownership of the means of production by the community* democratically organized, and their operation co-operatively for the equitable good of all" (p. 1,129).

But it is a more English way of thinking to look at an idea as it is embodied in a familiar fact, such as that department of the State called the General Post Office. Englishmen are not theorists, and are rarely captured by theoretical reasoning. We are practical men, and can more clearly understand Socialism as we see it at work at our own doors and in our own streets, than from any lengthened statement.

The Postal Service.

Here we see the Socialistic idea in operation. And first, we note a large number of our fellow-citizens enrolled as servants of the whole community. As children, most of them have been trained in State schools, and at the expense of the State. Then they have passed their examinations and been assigned their posts according to their qualifications. They do their appointed work without seeking to amass great riches. They are fairly content with their wages. They have a moderate measure of comfort. They are not anxious about old age. They have a sense of security; nor do they dread the workhouse, for pensions are secured to them. In London they have their Sundays free for mental and spiritual culture, and if they desire it, for work for the world. Clearly they are animated, not by the spirit of greed but by the Socialistic spirit of service. They own nothing. The buildings in which they labor are not their own; the red pillar-boxes which they empty do not belong to them. There is no private ownership, and yet they do not "dawdle;" they do not waste their time. They are honest and industrious. Our letters come with regularity, and on the stroke of the clock all through the day; and they find their reward in the moderate wage they receive, and the sense that they discharge their duty.

Their home-life is their own. The relations between husband and wife and children are sweetened by the removal of all uncertainty and anxiety as to income; and in all other respects the postman is as much master of his home and of his life as any citizen of the land. At present he pays rent to a private person for his home. In a fuller Socialism that rent will go to the whole community; and in all probability his hours of toil will be fewer, his freedom wider, and his life richer in the things of the mind and spirit.

There you have as in a mirror the idea and spirit of the Socialistic movement. That is what it does. That is what it means. That is what it seeks to do for the individual citizen and for the whole commonwealth. That is what it seeks to achieve of liberty, of contentment, and of widespread serviceableness. The illustration does not tell all that is to be told ; but it answers objections, corrects mistakes, and affords a surer guide to the idea of Socialism as a movement than a whole sheaf of definitions.

Socialism Constructive.

Now the Post Office is a constructed State effort. It is a creation of intellect. It springs from the brain of Rowland Hill, and it advances by the State-building efforts of successive Postmasters and others to its present world-wide proportions and immeasurable usefulness. In that respect it is typical of Socialism as a movement. Socialism is intrinsically constructive. It displaces the haphazard labors of an individual by the organized efforts of all. I know it is often said that "England has blundered into greatness." I do not believe it. I know she has "blundered" into misery and cruelty, into perilous wealth for the few, and chains and curses for the million ; into debasement and defilement for her daughters, and ruin for her children ; and therefore no sign of the times is brighter than that which assures us that the hour has struck in which this "blundering" must stop, and the most direct route be taken from the Tartarus in which so many of our fellows suffer to the Elysian fields of mutual service and general wellbeing.

Hence, Socialism seeks to create a State which shall exist for all and be served by all ; a State which shall provide work for all, and reward that work according to the quality and quantity of the work done ; a State which shall give liberty and justice, security and comfort to all men, women, and children ; a State which shall "fix a definite minimum of welfare below which no one shall be allowed to fall," and yet shall not permit anyone to be defrauded of that to which he is justly entitled ; a State in which service and honor, and not mere greed and vain show shall be the chief motives of action ; a State in which every facility that the combined action of the whole of the intellect and goodwill of the community can invent or create, shall be offered for the training of the young, the protection of the imperilled, the succour of the weak, the comfort of the aged, the diffusion of happiness, and the increase of moral worth. Socialism will not leave everything to chance or to "good fortune," or to inheritance, or to superior might. It expects thought. It asks for intelligence. It invites science. It combines citizens together, and seeks to bring into a system the whole of the tendencies now working in the heart of the civilized world for the common good.

The Sanity of Socialism.

This movement, as I have said, is still very young : but it is becoming increasingly sane, balanced, statesmanlike, scientific, and

trustworthy. I admit that the "swollen floods of sophism, fallacy, cant, and rant," let loose by the agitation for the "Rights of Man" have not entirely disappeared; but I hold that the impracticable and implacable theorist is no longer representative. Every man who calls himself a Christian cannot be accepted as a sample of the Christian spirit or the Christian method; nor can everyone who wears a Socialist badge and carries a Socialist banner be justly regarded as speaking for the movement. Still less ought the assertions of the man whose one object is to bespatter and destroy Socialism to be allowed any place in the scales of judgment; assertions, for example, made by a man I will not name, that "Socialism is atheism," or that "the very essence of Socialism is that all the ten commandments should be swept away"; assertions based either on the misquotations of opponents or on the wild speech of non-representative men. For it is undeniable that the doctrinaire and cantankerous Ishmaelite is disappearing from the movement. The doctrinaire is far to seek. The mere theorist is at a discount. Few now expect a sudden revolution; most work to hasten a natural and orderly evolution of the Socialistic State. The historic sense is begetting the feeling that to-morrow must grow out of to-day, just as whatever elements we have of order and of progress, of liberty and good legislation, have grown out of yesterday.

Its Catholicity.

Socialism is not a class movement. Labor is in it; but so is science. The democrats of the streets proclaim its ideals, but so do students of the universities. Agnostics confess its obligations, and orthodox Christians are eager to forward its aims. In fact, the feature of the world's life that is the most prophetic of the future is the subsidence of the exclusive dominance of individuality, and the emergence of the social consciousness, of the sense of intimate, I may even say fraternal, relations—relations not only to the denizens of the home, the members of our "set," or of our "church" or profession; but to the municipality, to the nation, and to humanity. The whole sweep and trend of the age is Socialistic. No one is satisfied with the present condition. Everybody admits it has anti-human elements, and the anti-human is felt to be anti-social, irreligious, ungodly, the modern Antichrist. The men of wealth feel its presence, and some of them clutch their gold with a fiercer passion, as though they feared its departure. The men of avarice are aware of it, and publish their "lies" broadcast to keep up their dividends, increase their trusts, and convey the gains of our common life into the pockets of the few. The civilized world is gradually but surely travelling towards Socialism. The good seed sown with weeping and tears by Carlyle and Ruskin, Lord Shaftesbury and Saint Simon, Proudhon and Fourier, Ebenezer Elliot and Ernest Jones, and others, is yielding its harvest in some thirty, in some sixty, and in some a hundred fold. We have socialized transit and illumination, and we are socializing hygiene and medicine. Officers for the care of the health of the public, and district nurses for

ministry to the sick, are becoming part of our civic and political administration. Just as we organize for the defence of our citizenship by the army and navy, so we are constructing a department for the defeat of disease and the maintenance of health. As we have socialized the teaching forces of Great Britain, so we are travelling towards the organization by the State of a body of highly educated men to watch over the physical health and strength of the nation.

Nor are we limiting the functions of the State to the body. The training of the young citizen for citizenship has definitely passed out of the hands of blind chance. It cannot be left to individual caprice or bigoted and crippling churchmanship. It is the first duty of the commonwealth to its young. The provision of libraries and museums, of reading rooms and picture galleries, of the recreative ministries of art and of the discipline and order of science, are following. Technical training for industrial life is becoming part of the daily bread offered to the citizen, not on the grounds of individual hunger, but from the necessities of communal growth and progress. Then it is increasingly felt that we cannot leave the worker ignorant of the trade of the world. He must have access to a national bureau of information concerning the changing conditions of labor—the reverses in this department, and the demands in that—so that he may be able to take opportunity when it is at the flood, and may arm himself against a sea of misfortunes. Already we have gone far in these directions. Recently our Board of Trade has taken up the responsibility of mediating in the conflicts of large industries; and now we have the declaration that a certain amount of the funds of the State is to be set aside for the promotion of international peace and goodwill, in order to provide hospitality and fraternity for bodies of visitors to our shores from other lands.

The civilized world is gradually making room for the Socialist movement. The heathen rage and "Municipal Reformers" say vain things against the march of this Socialist spirit, but it is in vain. Bit by bit, inch by inch, the social conscience grows. The moral and social implications of the fundamental human fact that "we are members one of another," demand legislative adoption. Quietly and slowly, but inevitably, the sway of the sense of social duty rises and rules so that this twentieth century is sure to be the century of a conquering and beneficent Socialism. Professor Dicey, in his "Law and Opinion of the Nineteenth Century," traces the gradual escape of the English people from the fierce antagonism to political and social government which darkened the first four decades of that period, through the hard and selfish individualism of the fifties and sixties and seventies, on to the dawning, in the latter part of the century, of that Socialism which is destined to be the distinction and glory of this.

The Divinity of Socialism.

The fact is, and this is what I want to show, this is the plan of God. Socialism, in the soul of it, is divine. It is of God. He is

behind all, and in all, and through all, working out His great redemption of mankind. God has His plan in every generation, and I cannot hesitate to believe that "the plan of God in this generation connects itself with that irresistible social tide which rises higher and higher against the dry strands of our time, seemingly making ready to inundate all the old moorings of the world, and to give the race entirely new levels of departure forth upon its immense mission. We are weary of endless sociological wranglings, and often deeply incensed with the intolerant Socialisms of our day. And yet, weary or incensed, the tide of a realized common life, a tide which bears on its heaving breast the neglected truth of the world, keeps on rolling in, like that superb Hangchow bore of which Professor Edmunds has been writing so interestingly in *The Popular Science Monthly*—a something invincible to any barriers erected against it, continually destructive of false individualism, and yet a something which bears up with it into the pent places of humanity a mighty saving freshness from the deep oceans of divine purpose. Indeed, the Socialism which makes for fulness and unity of the common life 'spreads undiminished, operates unspent,' and has already covered, and covered to its permanent sway, whole regions of human experience."

It is political, in the sense that it has to get its work done through Parliament ; it is civic, because it acts through the municipal and urban councils ; it is international, for it seeks to displace the enmity of nations to one another by amity ; it is literary and artistic, for it uses all forces that heal and help our suffering races ; but in all and over all it is fundamentally spiritual and religious. In the language of John Shorthouse, "The world spirit is often the Christ spirit, and . . . when we begin to see that His footsteps may be traced in paths where we little expect to find them, we shall no longer dare to talk of the secular life," but shall rejoice to recognize that these, too, are the ways by which the kingdoms of this world are becoming the kingdoms of our God and of His Christ.

Still, I do not say that this movement is the *final* form of human society. We do not know, we cannot tell. Finality is a word we cannot place on anything. It does not belong to our vocabulary. But Socialism is the next, the necessary, the vital, the saving movement. Yet, just as the wage-earning period, with its colossal capitalists ; its giant plunderers, usurers, and sweaters ; its princes of philanthropies ; and its myriads of miseries and cruelties, was confessedly an advance in the conditions of slavery ; so Socialism may only be a stage in the wonderful evolution of the manifold life of the children of God.

The Churches Awake.

Now since that picture of the spirit, idea, method, and goal of constructive Socialism is demonstrably accurate, is it not a thing incredible that any of the churches of Jesus Christ should be fiercely antagonistic to it, or coldly critical, or haughtily sceptical, or superciliously indifferent ?

Indeed, already those moods are passed or passing. The churches are awake to the golden opportunity at their doors. They are beginning to see that this is the hour of their visitation ; that they must rise and interpret the revelation given by God in the social Bible of the world's life, and take the fullest advantage of this widening and unifying of the life of men for the establishment of the gracious and redeeming rule of God over the earth. As the Reformers seized the hour of the awakening of the intellect and conscience of Europe for the proclamation of the original Gospel of God, and the assertion of the rights of man against the tyrannies of priests and popes ; as Wesley, Carey, and Howard, breathing the new social spirit created by the light which had been cast on the incalculable values of every human soul, made the epoch of the Evangelical Revival, of redeeming philanthropy, and of missionary enterprise ; so the churches have already found in the presence of this vast change of social ideas and feeling, that

"New occasions teach new duties ; time makes ancient good uncouth ;
They must upward still, and onward, who would keep abreast of truth.
Lo, before us gleam her camp fires ! We ourselves must pilgrims be,
Launch our Mayflower, and steer boldly through the desperate winter sea,
Nor attempt the future's portal with the past's blood-rusted key."

It must be confessed that the churches have been slow of heart to perceive all that God has been teaching. They should have been the first to learn ; they have been the last. They ought to have led ; they have to follow. Their place was in the van ; they are still in the rear ; but they are in the rear, and in time will march on to their true place. They have had their vision. To them, as to Peter, sleeping and hungry on the housetop of Simon the tanner, the divine revelation has come. The sky has opened to their view, and what seemed to be an enormous sail has descended from heaven, and in it are seen all kinds of questions and problems, domestic and social, civic and national, questions of strikes and lock-outs, property and rent, sweating and intemperance ; and a voice has been heard saying, "Rise, disciples of Christ, face these questions, and help to find the right answer." "On no account, Lord," has been the answer. "We have never yet touched these unspiritual things ; they are outside our boundaries, and belong to the secular life of men." Again a second and a third time the voice has been heard saying, "What God has created you must not regard as unholy. His creative acts cleanse all the products of His power. The life of the State is His care. Labor is sacred. It is not for you to call His work unclean, or to restrict the outflow or overflow of His impartial love."

And while the churches have been greatly perplexed as to the meaning of the vision they have seen, men arrive from the Cæsareas of industry and literature asking for an interview, and reporting that they, too, have had a vision of the aid the churches may and ought to render in the present stress ; for God, by His own gracious Spirit, has been preparing men, outside the bounds of the churches, to listen to the message they have to deliver concerning the relations of these economic and social questions to the spiritual life of man, and God

says, "Rise, and go without any misgivings, for it is I who sent them unto you."

So the churches are going to Cornelius. Our Free Churches have been sending their Simon Peters for a long time. What changes we have seen in our attitude during the last forty years! How the horizons have been lifted! What new sympathies throb in our hearts! How the compassions of Christ for the multitude move within us!

But the most welcome sign of change is in the Pan-Anglican Congress, for it has devoted, apparently, about three-fourths of its time, and more of its interest, to these vital problems of the world—gambling and intemperance, opium and alcohol, sweating and housing, low wages and unemployment—tracing them through their wide ramifications in the social organism, their destructive effects on young and old, and indicating the means by which these evils may be abolished.

The fact is, Christian men are ceasing to see any incompatibility between a rich and full spiritual life and the effort to reconstruct society on a Christian basis; and nearly all churches agree that in order to save men from sin and sinning they must face the whole life of man, the physical and industrial and social, not less than the life of the conscience and the will, of faith, and of love. They *must* enter into the Socialist movement. Admitted that it leaps up from unexpected quarters, and that our Rabbis have been heard saying with mordant contempt, "Search and look, out of Lanark and Paris ariseth no prophet"; admitted that the bold and adventurous apostles, according to the standard of the "schools," are unlearned and ignorant men, and threaten to overthrow the temples of orthodoxy, and to cast out the priests from the synagogues; yet it has to be confessed that they are inspired and sustained by the Christian conviction of the upward and onward progress of the destinies of mankind, are gripped by the vital truths and quickening fundamentals of the Kingdom of God, and are urged forward in their zealous crusade by genuine good will. Admitted, moreover, that the difficulties in the way of this social reconstruction are enormous; that to substitute a new economic system for the old, however brutal and destructive of human life the old system may be, is a task demanding the concentrated energy of an age, or perhaps of ages; that the institution of private property in land, houses and the like, is mixed up, seemingly inextricably, with the passions and habits and interests of men, and has been for centuries; that rent and interest are apparently as necessary to us as our breathing; admit all, still the churches feel and know they cannot hold aloof from this movement. It is of God, part of His plan, and they must accept it; fall in with it; and face it with courage, and hope, and do their best.

But what is their best?

What the Churches must not do.

That I will attempt to show; and first, let me say with the utmost emphasis, the churches must not imagine for one moment that they have to cease from their simple and unflinching testimony

to their own truths and ideals as fellowships of Christians organized expressly for the preaching of the gospel and the cultivation of the spiritual life. There must be no slackening of devotion to our *primary* work, no lowering of our aims ; no submission to the dominion of the flesh and of sense. Soul is supreme in the life of man and will remain supreme. Soul is all, and all in all. Men may deny it. They do, they will, and not altogether without reason considering what poor Christians we are ; but in the long run they are confronted and convinced by the irresistible logic of facts. History and present experience alike declare that no other name than that of Christ is given whereby we can have social salvation. Apart from His idea and spirit and work we can do nothing effectively ; not even take the accurate measure of man's real need, or the height of his possibility. This work of preaching and living the Christ is primary and fundamental to the actions of the churches in the constructive social movement ; and it requires vast reserves of courage and perpetual alertness. The world is always with us, and its maxims and customs and spirit always gravitate towards "compromise." At each stage the question rises how much of this wrong can we tolerate : and we are frequently ensnared by the evil we tolerate into treating it as though our toleration of it has made it good and just in itself. Our duty as churches is to keep the ideal at its highest, *i.e.*, as high as the standard set us by Jesus Christ ; to say that the Kingdom of God is within men or it cannot be without ; that all national progress depends on character ; that the springs of social well-being are in the hearts and wills of men ; to insist that a tolerated evil is still evil ; that a wrong that is hoary with the weight of years and crowned with the approval of the great, is still a wrong. The churches are to witness against "compromise" even when it endures it, to resist the invasion of the realm of conscience by the magistrate, to assert the moral limits of accumulation, to war against trusting in uncertain riches, to insist that though a "time limit" for an evil system may be extorted, it does not cleanse the evil during the time of its existence, or excuse men from doing battle to end it altogether.

The Churches must care for the Spiritual Element of Socialism.

Nor is this all. The churches must take care that this social movement is not narrowed down to the economic side of life, as though a man had but one side to his nature, and was not a mysterious being with immeasurable possibilities both in time and eternity. It is for the Church to insist upon and secure the *spiritual* quality of Socialism. Owen and Marx have affirmed the economic element. The Fabian Society has illuminated and enforced the historical, and made clear that we cannot bury the old order and start as from creation's dawn. H. G. Wells and others have contended for the rational and ethical element ; the churches must add the most important of all, the spiritual. It is this we can give. It is this we must give. Not apart from the economists, but with them ; not apart from the evolutionary Socialists of the Sidney Webb school,

but with them and through them ; not apart from the professors and teachers of the science of sociology, but with them ; informing and quickening the collective mind, and supplying that spiritual momentum which is absolutely requisite so that the constructive Socialism of the State may attain to the fulness of the stature of the perfect manhood of Christ.

This is our place in God's plan. The movement will not advance on sure and solid lines unless it is fed with the intelligence and faith, the patience and love, the hopes and high ideals, the sense and the enthusiasm of *spiritual* brotherhood. Without that aid it will sink into a dull, dead mechanism, or a more or less skilfully constructed machine, and become a mere matter of ballot boxes and suffragists, as if man were only created to "mind" a machine, and women were added only to give pleasure to him when the "minding" was done, and children followed so that the "minding" of the machine might not come to an end.

Let not the churches fear. If they are alive they will be wanted. If they are not alive they had better be carted away and buried. If they are faithful to Christ and His teaching and spirit, they will supply one of the most influential forces for forwarding the great social change. Socialism demands a far higher level of intelligence, of knowledge, of drilled capacity, of freedom and of moral worth than individualism. You cannot re-mould society out of illiteracy, indiscipline, intemperance, and selfishness. The full co-operative commonwealth is only possible where you have the best all-round type of man and woman—educated, drilled, self-reverent, self-controlled, self-sacrificing, free, and brotherly : capable of suppressing greed of gain and finding satisfaction in service. Efforts for the construction of Socialistic conditions break down for lack of character. Men are not yet "moralized" up to the point where a co-operative community is possible. Therefore the churches, made up of disciples of Christ, must give themselves to the work of what Paul calls "edification" or "man building" ; they must stir and illumine the conscience, create good and healthy opinion, turn opinion into conviction, and conviction into action, elevate ideals, stiffen will, and fire with enthusiasm, and so supply the character, freedom, and force on which the order and progress of mankind ultimately rests.

The Emancipation of the Churches from Anti-Social Conditions.

Again, the churches should free themselves from every anti-social alliance and anti-social condition. They ought not to have any complicity as churches with politics and practices based on social inequalities, social monopolies, and anti-Christian social distinctions. The Christian society should realize in all its arrangements the ideal of the social commonwealth, and breathe in all its actions the bracing air of liberty and equality and fraternity. It ought not to accept any special favors from the State. It must render to Cæsar the things that belong to Cæsar. It is of right the foremost trustee

and chief guardian of the liberties of man ; because it has to render to God the things that are God's ; to care for liberty of conscience ; that liberty which includes and guards the liberty of speech, and of the press, and all the great freedoms of the soul of man. It must not be content with evil conditions because they are inherited, and yield large advantages to itself as a society at the expense of the freedom and rights of other members of the community. It must not hold itself aloof from or averse to change, because it may suffer thereby ; but be willing and even eager for the changes that lead to the greater good of all.

Indeed, in the Church of the New Testament we see existent, in principle and in germ, what we expect to enjoy in a perfectly constructed social state. The Church of God in the Acts and Epistles knows nothing of class distinctions—has neither laymen nor clerics. "Ye are an elect race, a royal priesthood, a holy nation," is the description Peter gives of the group of saints to which he belongs. The apostle and the prophet, the teacher, the evangelist and helper are one ; all distinctions within the body disappear in the one sacred distinction of being within the circle of the people of God. It knows no separating class arrangements. It is the foe of caste. Mammon worship is swept utterly away by the flowing waters of the Church's generosity. Race antipathy is alien to its spirit, and love is poured out in steady and limitless floods. There, in the ardors and achievements of the first churches, we have set before us what we ought to seek with full purpose of heart for all men.

Study.

Further, the churches must encourage and systematize the study of social facts by their own members. It is fitting that we should know the main current of the whole Socialistic movement, and follow the story of the organization of the masses of workmen into a solidarity of interests ; why it is here ; why it has come now ; what it means and towards what it is driving. Ignorance is the prolific mother of misery. Our young people do not know, and therefore they do not consider, how the bodies of their fellows are stunted, their minds crippled and fettered, and their souls lost by the hardness of economic conditions. The young Socialists outside the churches enquire, and enquiry leads to sympathy and action. The Fabian Society instructs by its literature and discussions. Professors of sociology teach in the schools of economics and political science connected with the University of London ; but the churches need to organize and direct classes for this study, so that our young people may be able to analyze and classify the social conditions of the workers ; know the civic institutions that affect their life ; the legislation as to insurance and pensions, factories and mines ; the laws of taxation, and so on ; and be led to see these facts in their relation to the deeper realities of the spirit, and from these high considerations seek the abolition of unjust land laws, make war on the causes and sources of poverty and vice ; and qualify for high-minded and self-denying service to the State.

Electoral Action.

Nor should the churches fail, at the times when they can control the constructive efforts of the commonwealth, to put men into office who are, by conviction and sympathy, in favor of using the wealth that accrues from our communal life for the good of all ; and eager to prevent its being appropriated for the selfish enrichment of the few. They ought to exclude from civic and political work those who juggle with the words "liberty" and "reform," in order that they may the more easily filch from the public purse the riches that belong to all, and return to power only those representatives of the people who will either largely modify or else get rid of laws and institutions that stand right across the path of the social reform—such as the House of Lords, the rule of the land by the few, the swollen tyranny of the drink trade, and the like—and who will be prepared to introduce that better era in which the community shall be administered for the good of all. The churches ought, whilst not, as churches, identifying themselves with Socialist organizations, to take their full share in the gradual reformation and rebuilding of society ; to welcome every practicable extension of the Socialistic principle ; and inspire their members to give themselves in all humility and lowliness of mind, with much patience and love, to organize our common life on the principles of brotherhood, of social helpfulness, and of the laws of the kingdom of God.

And assuredly the churches can and ought to keep the minds of men alert to note every existing wrong in the framework of society, to feed the courage and patience that battles with that wrong and tries to rid the world of it, and to inspire that passion of the Cross by which men will be ready to toil and fight and suffer for that full redemption and regeneration of the individual and of the world which Jesus Christ came to effect.

THE FABIAN SOCIALIST SERIES.

The first four volumes consist of revised, collected, and classified editions of some of the most valuable of the famous "Fabian Tracts" in a style more suitable for the general reading public, and supplying in a handy and attractive form the best and most authoritative thought on "What Socialism Means." Each booklet contains not less than 96 well-printed pages, good paper and good type, and is supplied in two forms, i.e., in attractive wrappers at 6d. each, nett, and in quarter cloth boards, gilt top, at 1s. each, nett. Postage 1d. and 2d. each respectively.

VOLUMES NOW READY:

- I. **SOCIALISM AND RELIGION.** CONTENTS: (1) Christian Socialism, by the Rev. Stewart D. Headlam. (2) Socialism and Christianity, by the Rev. Percy Dearmer. (3) Socialism and the Teaching of Christ, by the Rev. John Clifford. (4) A Word of Remembrance and Caution to the Rich, by John Woolman, of the Society of Friends.
- II. **SOCIALISM AND AGRICULTURE.** CONTENTS: (1) The Village and the Landlord, by Edward Carpenter. (2) State Aid to Agriculture, by T. S. Dymond. (3) The Secret of Rural Depopulation, by Lieut.-Col. D. C. Pedder. (4) The Revival of Agriculture, by the Fabian Society.
- III. **SOCIALISM AND INDIVIDUALISM.** CONTENTS: (1) The Difficulties of Individualism, by Sidney Webb. (2) The Moral Aspects of Socialism, by Sidney Ball. (3) The Impossibilities of Anarchism, by G. Bernard Shaw. (4) Public Service *versus* Private Expenditure, by Sir Oliver Lodge.
- IV. **THE BASIS AND POLICY OF SOCIALISM.** CONTENTS: (1) Facts for Socialists, by the Fabian Society. (2) Capital and Land, by the Fabian Society. (3) Socialism: True and False, by Sidney Webb. (4) Twentieth Century Politics, by Sidney Webb.
- V. **THE COMMONSENSE OF MUNICIPAL TRADING.**
By G. Bernard Shaw.

BALLADS AND LYRICS OF SOCIALISM. By E. Nesbit. Paper 6d. net (postage 1d.); boards 1s. (post. 2d.) A delightfully printed and attractively produced volume of verse written between 1883 and 1908. It fills a distinct gap in Socialist literature.

LONDON :
THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. 3d., post free 4d.

"THOSE WRETCHED RATES!" a Dialogue. By F. W. HAYES. 1d.

FABIAN ESSAYS IN SOCIALISM. (43rd Thousand.)

Paper cover, 1/-; plain cloth, 2/-, post free from the Secretary.

FABIAN TRACTS and LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 78, 3s.; post free 3/5. Bound in Buckram, 4/6; post free for 5s.

I.—General Socialism in its various aspects.

TRACTS.—139. Socialism and the Churches. By the Rev. JOHN CLIFFORD, D.D. 138. Municipal Trading. 121. Public Service versus Private Expenditure. By Sir OLIVER LODGE. 113. Communism. By WM. MORRIS. 107. Socialism for Millionaires. By BERNARD SHAW. 133. Socialism and Christianity. By Rev. PERCY DEARMER. 78. Socialism and the Teaching of Christ. By Dr. JOHN CLIFFORD. 87. The same in Welsh. 42. Christian Socialism. By Rev. S. D. HEADLAM. 79. A Word of Remembrance and Caution to the Rich. By JOHN WOOLMAN. 75. Labor in the Longest Reign. By SIDNEY WEBB. 72. The Moral Aspects of Socialism. By SIDNEY BALL. 69. Difficulties of Individualism. By SIDNEY WEBB. 51. Socialism: True and False. By S. WEBB. 45. The Impossibilities of Anarchism. By BERNARD SHAW (price 2d.). 15. English Progress towards Social Democracy. By S. WEBB. 7. Capital and Land (7th edn. revised 1908). 5. Facts for Socialists (11th edn., revised 1908). **LEAFLETS.**—13. What Socialism Is. 1. Why are the Many Poor? 38. The same in Welsh.

II.—Applications of Socialism to Particular Problems.

TRACTS.—136. The Village and the Landlord. By EDWARD CARPENTER. 135. Paupers and Old Age Pensions. By SIDNEY WEBB. 131. The Decline in the Birth-Rate. By SIDNEY WEBB. 130. Home Work and Sweating. By Miss B. L. HUTCHINS. 128. The Case for a Legal Minimum Wage. 126. The Abolition of Poor Law Guardians. 122. Municipal Milk and Public Health. By Dr. F. LAWSON DODD. 120. "After Bread, Education." 125. Municipalization by Provinces. 119. Public Control of Electrical Power and Transit. 123. The Revival of Agriculture. 118. The Secret of Rural Depopulation. 115. State Aid to Agriculture: an Example. 112. Life in the Laundry. 98. State Railways for Ireland. 124. State Control of Trusts. 86. Municipal Drink Traffic. 85. Liquor Licensing at Home and Abroad. 84. Economics of Direct Employment. 83. State Arbitration and the Living Wage. 48. Eight Hours by Law. 23. Case for an Eight Hours Bill. 47. The Unemployed. By JOHN BURNS, M.P. **LEAFLET.**—104. How Trade Unions benefit Workmen.

III.—Local Government Powers: How to use them.

TRACTS.—137. Parish Councils and Village Life. 117. The London Education Act, 1903: how to make the best of it. 109. Cottage Plans and Common Sense. By RAYMOND UNWIN. 76. Houses for the People. 99. Local Government in Ireland. 82. Workmen's Compensation Act. New edition for the Act of 1906. 62. Parish and District Councils. 54. The Humanizing of the Poor Law. By J. F. OAKESHOTT. **LEAFLETS.**—134. Small Holdings, Allotments and Common Pastures: and how to get them. **FABIAN MUNICIPAL PROGRAM, FIRST SERIES** (Nos. 32, 37). Municipalization of the Gas Supply. A Labor Policy for Public Authorities. **SECOND SERIES** (Nos. 90 to 97). Municipalization of Milk Supply. Municipal Pawnshops. Municipal Slaughterhouses. Women as Councillors. Municipal Bakeries. Municipal Hospitals. Municipal Steamboats.—Second Series in a red cover for 1d. (9d. per doz.); separate leaflets, 1/- per 100.

IV.—Books. 132. A Guide to Books for Socialists. 29. What to Read on social and economic subjects. 6d. net. 129. More Books to Read. Supplement to October, 1906.

V.—General Politics and Fabian Policy.

127. Socialism and Labor Policy. 116. Fabianism and the Fiscal Question: an alternative policy. 108. Twentieth Century Politics. By SIDNEY WEBB. 70. Report on Fabian Policy. 41. The Fabian Society: its Early History. By BERNARD SHAW.

VI.—Question Leaflets. Questions for Candidates: 20. Poor Law Guardians. 28. County Councils, Rural. 102. Metropolitan Borough Councils.

BOOK BOXES lent to Societies, Clubs, Trade Unions, for 10s. a year.

Printed by G. Standring, 7 Finsbury St., London, E.C., and published by the Fabian Society, 3 Clement's Inn, Strand, London W.C.

BALLADS AND LYRICS OF SOCIALISM. By E. Nesbit. 6d. net and 1s. net (postages 1d. and 2d.).

"These two lyrics alone ('Inasmuch as ye did it not' and 'In Trouble') raise E. Nesbit higher than all the excellent fiction she has written ; they leave the reader angry and ashamed, with his humanity painfully stirred, and his self-satisfaction in rags. For the rest, there are . . . many appeals to freedom . . . fine hopeless-hopeful fighting songs . . . poignant little sketches of individual types . . . and poems of sheer revolt."—*Morning Leader*.

CHILD LABOR UNDER CAPITALISM.

The Industrial Revolution and Child Labor.

At the end of the eighteenth century England ceased to be predominantly agricultural and became the most important manufacturing country in the world.* Child Labor being regarded by the manufacturers as absolutely essential to the speedy piling up of fortunes, the morality of which no one questioned, it was universally employed in the cotton mills and factories which suddenly sprang up in the land. Manchester, specially the seat of the cotton trade from its earliest days, was the greatest employer of Child Labor, and became wealthy and populous. In ten years—from 1780-1790—the population almost doubled, owing to the inrush from the country of people, who were tempted by high family earnings to barter their infinitely healthier existence on the land for life in crowded slum cities. A positive majority of the workers in the cotton mills were young children.

Until the middle of the eighteenth century spinning and weaving had been done in cottage homes with the simple hand looms which had altered but little from primitive times. But with the introduction of elaborate and costly machinery into factories the work changed its character. New methods, new buildings, new modes of life superseded those of the rural life of the English peasantry. The latter at first refused to allow their children to work in the factories and mills which had been built by their streams and rivers from which was derived the water-power which worked the machinery. The parents at first considered it derogatory and degrading work for young people. But to procure the cheapest form of labor was considered not only justifiable but almost a mandate from heaven. The wealth that poured into the country, notably into the pockets of the manufacturers, was regarded as a reward from God for industry and self-help. Unfortunately in the workhouses of London and other large towns manufacturers easily found the cheap material they required. Shoals of unwanted children of all ages, even as young as five and six, were transported from workhouses and sent as parish apprentices to remote districts wherever their labor was wanted. The parish authorities, whose callousness was equalled by the manufacturers, were only too anxious to be rid of the burden of rate-supported children, and they actually stipulated—so little did humanity and pity rule their hearts—that a due proportion of feeble-minded children must be taken as part of the contract. As far as is known no further interest by the overseers was shown in the fate of these hordes of victims of ungoverned industrialism.

* *The Industrial Revolution*, by Arnold Toynbee ; *Growth of English Industry and Commerce*, by W. Cunningham ; *Capital*, by Karl Marx.

No one can tell how many thousands died unknown and untended over a long series of years. No records were kept. It was no one's business to see after such children. Employers for the most part regarded their apprentices as of less value than their machines, which at any rate were kept clean and carefully preserved. The masters themselves were frequently men of low type, with little or no education, who had often come from the ranks of manual labor themselves, and who were intoxicated with their own sudden wealth. They had little sympathy for the class from which they had sprung. Children worked side by side with adults and for the same length of time. They worked all day and sometimes all night ; they were cruelly beaten if fatigue overcame them at their work ; they worked in bad air without ventilation or sanitation, and with no regard to cleanliness or decency (the two sexes being herded together at night in huts) ; they received no personal care morally or physically, no education, no love. Many were living skeletons, some almost gibbering idiots. They died off like flies from various diseases, especially pneumonia, fostered by the sudden changes of temperature from damp heat in the mills to cold outside. Malignant fevers decimated them from time to time, and of those who survived many were in poor health, ignorant of the commonest things, and destitute of all education, secular, religious or moral.*

The work in the mills was, perhaps, not in itself hard. It consisted of piecing together the broken threads of cotton, of removing obstructions from the machinery, and of cleaning its parts. But accidents were not infrequent. And the children of all ages stood at their work the whole day through (often from twelve to fifteen hours at a stretch, with one and a half hours' interval for meal times), under pitiless taskmasters.

The conscience of society gradually became aroused to the evils of the system when the sins committed upon the hapless children reacted upon itself. When infectious fevers, originating in the dens where the little apprentices festered, were caught by children and adults outside, it was brought home to people that some foul wrong existed somewhere.

In 1784 the Manchester magistrates requested a committee of medical men, led by Drs. Percival and Ferriar, to investigate an outbreak of fever in the Radcliffe cotton factories. Dr. Percival, F.R.S., President of the Manchester Literary and Philosophical Society, had had his attention specially called as a medical man to the evils and ravages of disease among the Poor Law apprentices in the town.

The first report, from which all subsequent factory legislation sprang, was that presented in 1796 to the Manchester Board of Health by Dr. Percival on the abuses and cruel conditions of life under which all the operatives, and especially the children, lived and died. It was resolved by the Board to invoke the aid of Parliament to establish laws "for the wise, humane, and equal government of all such works."

* *Life of Robert Owen*, by F. Podmore ; *History of Factory Legislation*, by B. L. Hutchins and A. Harrison.

Robert Owen.

On the Board sat Robert Owen, cotton spinner, embryo philanthropist, and pioneer of factory legislation. He and his two partners subsequently purchased the cotton mills of New Lanark belonging to David Dale (whose daughter Owen married), and who was one of the few instances of a humane and enlightened master of that period. Owen carried on the work at New Lanark in the same humane spirit as his predecessor, and instituted a series of reforms in Child Labor. He raised the minimum age of the workers to ten, and refused to take any more Poor Law apprentices, preferring to gather in as employ  s children who lived at home with their parents. He established infant schools where children from one year old were kept in a very superior cr  che and kindergarten combined. In his schools for older children he established co-education, and had dancing, military drill, natural science, botany, arithmetic, geography, history, singing and music taught. He allowed no punishments of any kind. The whole atmosphere of his schools was one of love. He, more than any educationist before or since, recognized that children are like plants, in that they want more than care and attention ; they want love.

The First Factory Act.

In 1802, Sir Robert Peel the elder, himself an owner of cotton factories, inspired by what he knew of his own mills at Radcliffe and the report of the Manchester Board of Health, introduced and got passed the first Factory Act known as "The Health and Morals of Apprentices Act." By this Act the hours of labor were limited to twelve a day, and the children were forbidden to work at night. They were to go to church once a month, and were to be taught reading, writing and arithmetic. Girls and boys were not to sleep in the same apartment. The factories were to be ventilated and periodically whitewashed. All this seems little enough to the modern sense, but it called the attention of right-minded people to the subject, and raised a standard of humanity which has never been lowered, and from it came, slowly it must be confessed and after fierce struggle, all subsequent factory legislation.

Employment of "Home" Children.

One result of this Act, which dealt solely with Poor Law apprentices, was the substitution for them of children who lived at home, on whose behalf the law had not interfered. The evils of excessive work were now transferred to the "home" children, and continued to be borne by them for many long and weary years. Steam power, after 1802, having replaced water power, factories were built in towns, and, as the children lived with their parents, many of the ghastly and horrible outrages on health and decency disappeared. But the hours of work were just as terrible. Seven was the age at which children began to work in the mill, but cases of even six and five were not uncommon, and they worked twelve hours a day—thirteen hours at a stretch with an interval for dinner

only, breakfast and tea being snatched while at work. No seats were provided, and the children stood the whole day through. Many had to clean the machinery on Sundays.

The Cotton Mills Act of 1819.

In 1819, through Robert Owen's influence and ceaseless endeavor, Sir Robert Peel the elder got passed the Act known as the "Cotton Mills Act" of 1819. Although shorn of all the chief provisions dear to Owen's heart, for which Sir Robert Peel himself had striven, "The Act of 1819," as Mr. Podmore says in his *Life of Robert Owen*, "marks the first and the most important step in the long procession of Factory Acts. Under it for the first time the State assumed the rights of parent and guardian to the children of the free, and took upon itself to prescribe the hours of work and the general condition of their labor."* This Act referred solely to cotton mills. The minimum age of employment was fixed at nine. The hours of labor were to be twelve per day. No provision was made for education, although this had been most strenuously urged by Owen.

The Acts of 1833-44.

It was not until 1833 that provision was made by the Act of that year for the appointment of paid Government inspectors. The hours of children's work were restricted to nine per day. But this Act failed to work satisfactorily, and the Act of 1844 was passed, enacting (1) that children from eight to sixteen must not work without a medical certificate; (2) that factories were to be inspected and registered; (3) that children under thirteen might only work half time. Extensions and amendments of this Act were made in 1867, 1874, 1878, 1883, 1891 and 1895.

The Coal Mines Regulation Act.

In 1887 the "Coal Mines Regulation Act," amending the statute of 1872 (which had replaced that of 1842), forbade girls and women and boys under twelve to work in any mine below ground and forbade it for boys from twelve to sixteen for more than ten hours a day or fifty-four hours a week.

The Factory and Workshops Act of 1901.

But the twentieth century has seen the most vital changes of all, the most important respecting Child Labor since Robert Owen pleaded nearly a century ago, viz., the consolidation and amendment of all the previous Acts into "The Factory and Workshops Act of 1901."

Child Labor To-day.

It comes as a surprise to the majority of present day people to learn that Child Labor still exists all over Great Britain, and for the most part to a highly injurious extent. This is more flagrantly the case in Yorkshire and Lancashire, where the "half time system" is

* *Life of Robert Owen*, by F. Podmore, p. 208.

in full play. According to the Report of the Board of Education for the year 1906-7 there were no fewer than 82,328 of these half timers or "partial exemption scholars"—to give them their official name. In 1904-5 the number was 80,368, and in 1903-4 it was 78,876. So the numbers are increasing.*

The three areas in which the largest number of "partial exemption scholars" are found are the Administrative County of Lancashire, with over 11,900, and the West Riding of Yorkshire and the County Borough of Bradford, each with over 8,000. All three areas show an increase in the number of these scholars in 1905-6 as compared with 1904-5. The County Boroughs of Oldham, Sheffield and Burnley also show noticeable additions to the number of "partial exemption scholars."

These half timers are children over twelve years of age who have obtained a labor certificate, and who are then allowed by the law to be sent to work half a day in mills or factories, provided that they are sent to school the other half of the day. Employment in the mill has to be either in morning or afternoon shifts, or on the alternate day system. One set of children begin work at 6 a.m. or 6.30 a.m. and go to school in the afternoon; the afternoon set go to work in the mill at 1 p.m. and end at 5 p.m. or 6 p.m., and attend school in the morning. A child may not be employed in the same shift either morning or afternoon for two consecutive weeks. No child may be employed on two successive Saturdays, nor on any Saturday if he has worked for five and a half hours on any day in the previous week. The maximum time for work for half timers is twenty-seven and a half hours a week.

Many of the children on the first shift rise at 5 a.m. (Mr. J. C. Clynes, M.P., states that he rose about 4.30 a.m. as a half timer); and sometimes they have to walk a mile to the mill in all weathers and be there by six o'clock. They have half an hour for such breakfast as they can afford. At mid-day they walk home to their dinners. At 2 p.m. they are in school.

Is it any wonder these children are worn out and that they fall asleep over their desks; or that the merciful teacher lets them sleep? The education that they receive is of very little use, whilst the injury done to their health by their double work is often irreparable.

Miss Clementina Black, President of the Women's Industrial Council, states: "I shall never forget the impression made on my mind by the peculiar mixture of pallor and eagerness on the faces of the little half timers the first time that I ever went over a weaving mill. The place was light and airy and the work was not hard, and the management considerate; but as to the children, any London doctor or any woman accustomed to the care of children, would have thought their appearance unhealthy and their expression of face abnormal."† Miss Black adds: "Labor in childhood inevitably

* See also the *Report on the Employment of Children in the United Kingdom*, by Constance Smith (British Association for Labor Legislation).

† *Sweated Industry*, by Miss Clementina Black, p. 122.

means, in nine cases out of ten, decadence in early manhood or womanhood ; and the prevalence of it among ourselves is perhaps the most serious of national dangers. It is an example of that most cruel form of improvidence described by the French proverb as 'eating our wheat as grass.'"

Bradford, a pioneer town as regards its admirable arrangements for the scientific feeding of the necessitous children at school, is one of the principal offenders in the sin of the half time system.

Miss Adler, a member of the Education Committee of the L.C.C. and Hon. Sec. of the Committee on Wage-earning Children, recently made personal enquiries at two manufacturing centres in the north of England, one having over 5,000 half timers, the other 800. She said the appearance of the children was sickly and pallid owing to the fact that the processes of cotton and wool spinning have to be carried on in a humid and warm temperature. All authorities whom Miss Adler interviewed stated that the children lost 50 per cent. of their education ; and she added that "teachers consider their whole moral tone is lowered, and that there is a visible deterioration which is most heart-breaking."*

Is there any plea that can be urged for the continuation of such a system ? Yes, there is. This is what the Right Hon. H. O. Arnold-Foster (late Secretary of State for War), writes by way of opposing Socialist reform : "The great cotton industry of Lancashire, the wool and worsted industry of Yorkshire, and many other industries in a less degree, *are at the present time dependent on Child Labor*" ; and he gives, as a plea for its justification and absolute necessity—exactly as Nassau Senior did three-quarters of a century ago : "The minute margins of profit and loss" owing to competition ; adding : "The fierce competition of the world, especially in those countries in which Child Labor and long hours are prevalent, has to be met."† No statement could be more condemnatory of our present social system based on competition.

Inspectors, managers, teachers, members of education committees are agreed as to the evils resulting from children working during the years that they attend school. Nor do the parents' necessities compel such child-slavery. All who have studied this question testify that, as a rule, it is the children of men earning good wages who are sent to the mills as early as the law allows, in order to gain a mere pittance of 2s. 6d. for twenty-six or twenty-seven hours work a week. One penny an hour is the usual rate of wages for a half time child working at the textile trade in Yorkshire. It is not the very poorest parents who are the greatest exploiters of their children. It is to be noted that all these children and their work come under the jurisdiction of the Factory and Workshops Act ; and that, accordingly, their lives for the most part are deliberately regulated and controlled by the State.

* *Child Workers and Wage Earners*, by Miss Adler.

† *English Socialism of To-day*, by the Right Hon. H. O. Arnold-Foster, pp. 99, 100.

Children not under the Factory and Workshops Act.

As regards children whose work does not come under the jurisdiction of the Factory and Workshops Act, and therefore escapes Government inspection, they may be classed as those employed (1) in shops, or by shopkeepers as errand boys and girls, and carriers ; (2) in domestic work ; (3) in street trading ; (4) in agriculture ; and (5) in various miscellaneous industrial employments at home or abroad.

The Parliamentary Committee of 1903 came to the conclusion that there were in England alone (apart from the half timers) 200,000 children thus employed as wage earners. It can easily be seen how such uninspected Child Labor may be exploited, and how extremely difficult, and, in many cases, how impossible it is to supervise and prevent its abuse.*

In London the half time system has been abolished, but there is very little else upon which the Metropolis can be congratulated as regards Child Labor.

Child Labor in Domestic Work.

The abuse of Child Labor in ordinary domestic work is the most difficult of all to control. Miss Bannatyne, a school manager and Acting Warden of the Women's Settlement at Southwark, stated before the Inter-Departmental Committee of 1903 that children are often absent from school one or two days a week on account of domestic employment. The casual labor is bad for the boys' character, and the long hours unfit them for school work. The girls suffer from drudgery in their own homes, which she saw no way of preventing. But if the half days could be prevented and the attendance at school more regularly enforced, she believed that whilst much Child Labor would be prevented it would not affect the family income to any appreciable extent. Thus, a stricter attendance must be enforced at school.

"Ay! There's the rub." If regular attendance at school were really enforced, the parents, knowing the law could not be evaded, would accept the situation. It would be an enormous gain all round ; first, to the children, who are now overworked, and whose education is spoilt by irregular attendance ; secondly, to the managers and teachers, many of whom are unceasingly worried over this question ; and thirdly, it would be a great saving of expense, as a large staff of attendance officers has to be kept under our present system to compel the parents to send their children regularly to school.

Even in the special schools for mentally defective children in Bermondsey, the writer has found cases of girl children who are such pitiful little drudges at home that the officer of the N.S.P.C.C. has had to be sent to "warn" the parents, with the result that the children are worked less hard, but only, it is feared, when closely super-

* The Government has appointed an Inter-Departmental Committee to enquire into the working and result of the half time system. The Trades Union Congress at Nottingham in September, 1908, passed a resolution urging its abolition.

vized by the officer. Another little girl in a special school gets 1d. a week and her tea for going after school to help a neighbor in domestic work and nurse the baby. (This penny she deposits regularly every week with the teacher for her own boot fund).

Of play, so absolutely essential to the proper physical and mental development of childhood, many of these children have next to none. They are old before their time and incapable of joy, and are weighed down by the responsibility of life.

Child Wage-Earners in London and the Provinces.

Miss Adler gave evidence before the Inter-Departmental Committee on Employment of School Children in March, 1901.* In the summary of evidence it is stated that: "For the purposes of the present enquiry Miss Adler had caused about 4,000 London cases and 3,000 cases in the provinces to be investigated. Those employed are about 10 per cent. of the total number of children. Miss Adler put in very voluminous tables, from which it appeared that out of 107 London schools containing 42,097 children, 3,897 were employed—633 in domestic work, 136 as barbers, 723 errand boys or girls, 1,227 in shops, 341 milk carriers, 386 street hawkers, 451 in other miscellaneous employments. Out of 3,527 cases in which the hours were clearly specified, 2,652 worked less than thirty hours a week, fifty-three worked over fifty hours in addition to school. The figures show that it is not the most needy parents who employ the children excessively. Some cases are very extreme; as, for instance, a girl employed sixty hours a week at trouser-making. Saturday work is often excessive. In the provinces returns were collected from some schools in twelve towns, showing out of 67,865 children that 3,049 were employed. The nature of employment and hours worked were much the same as in London, and many cases of excessive hours were to be found. In London the street traders were about one-tenth of those employed. In the provincial towns they amounted to nearly one-fourth of the total employed. Of the employments, domestic work, that is, going in to clean knives and boots, is the least harmful. Street selling is always bad."

Wage-Earning Children in Hoxton and Bermondsey.

In March (1908) the writer accompanied Miss Adler in her inspection of wage-earning children at a boys' school in Hoxton and at a girls' school in Bermondsey. They found 15 per cent. of the boys in the Hoxton school were wage earners. They were employed as errand boys to take out bottles, parcels and papers; at a tea shop, at a coal shop, at an upholsterer's, at a barber's. As street sellers they sold laces, salt, pot-herbs, vegetables, blacking. One "picked over green stuff" for a greengrocer; one ran errands for a maker of doll's arms; one looked after a crippled boy; one helped at a whelk and mussel stall; one made capsules, one cardboard boxes, one sticks; whilst one covered steels.

* Minutes of Evidence taken before the Inter-Departmental Committee on Employment of School Children in 1901, pp. viii. and 70-73.

At the girls' school in Bermondsey some ran errands, some minded neighbor's babies, some sold vegetables in the streets, or helped at coster stalls, some played with neighbors' children, some sold alone in the streets, which is illegal. The boys' occupations are the most varied and interesting. Those of the girls' are often very heavy, tiring and dreary. "Bright girls," Miss Clementina Black truly says, "are put to work far too soon, and they become apathetic, listless women at thirty-five who might be fifty."

Mrs. Hogg's Report.

Nine years have passed since the evils of Child Labor were brought officially to the notice of our rulers, and that by a woman. Mrs. F. G. Hogg (Secretary of the Education Committee of the Women's Industrial Council), made a special study of the subject and organized a deputation to Sir John Gorst, then Vice-President of Committee on Education, respecting it. A Parliamentary enquiry was instituted, and the facts brought to light were so terrible and unexpected that Sir John Gorst in the House of Commons called it "a perfectly sickening document which threw a lurid light upon the social conditions of a large part of the population." One manager stated: "Without exaggeration I can truthfully assert that there are to-day in our National and Board schools thousands of little white slaves."

This Parliamentary report stated that 144,000 boys and 34,000 girls worked regularly for money out of school hours, but nothing was said of casual or seasonal work. Of the children regularly at work, 131 were under six years of age, 1,120 between six and seven, 4,211 between seven and eight, 11,027 between eight and nine, and 22,131 between nine and ten. One little boy peeled onions twenty hours a week for 8d. a week. A milk boy received 2s. a week for twenty-eight hours labor a week—less than 1d. an hour. One boy received 6d. for twenty hours work a week. A little boy engaged in pea-picking received 3d. a week. A little girl under six carried milk for thirty-five hours a week for her parents, and earned no wages. Another under six was a nurse girl who worked for twenty-nine hours a week for 2d. and her food. A boy of ten worked seventy-two hours a week for a farmer for 3s. A newspaper boy worked 100 hours a week, including Sundays (over fourteen hours a day), and received 3s. 6d. a week and his meals. One girl of twelve was employed before, between and after school for six and a half hours a day for 3d. a week. Another girl of twelve got 9d. a week and her food for carrying out parcels for six and a half hours daily during the intervals when she was not at school. A greengrocer's boy of twelve started for the London market every day at 2.30 a.m. He returned at 9.30 a.m. and then went to school!

One would have thought that after such revelations as these were officially made known to Parliament it would have bestirred itself to remedy the evil. But the usual delays occurred.

The Inter-Departmental Committee on the Employment of School Children, formed in 1901, represented three of the great

Departments of State—the Home Office, the Board of Education, and the Board of Trade. As a result of this, in 1902, a Bill to deal with Child Employment was introduced, but, as Sir John Gorst says,* “was not proceeded with, the time of Parliaments being occupied with subjects more interesting to the governing classes. It was introduced again in 1903, and, by great good luck, became law on January 1st, 1904; but in 1906, in most places, in spite of the Act of January 1st, 1904, the deliverance of over-worked children is still a long way off. The local authorities belong, to a very great extent, to the governing class, and are not much under the influence of working-class opinion.”

The Need for a Socialist Party.

Sir John Gorst winds up his chapter on “Overworked Children” thus: “The story of this attempt at reform illustrates the impotence which threatens our social system, and the incapacity of the governing classes to carry out the simplest measure of social reform, even one which does not affect their interests, and on the necessity for which they themselves are agreed. It seems to justify the people in revolting against the parties into which the governing classes have divided themselves, in forming independent labor parties and in endeavouring to take the regulation of Society into their own hands. The present holders of power, according to the view of the rising party of the people, have had their opportunity; they have failed to avail themselves of it, and the carrying out of necessary reforms must now pass into other hands.” Moreover, as Sir John Gorst adds: “Had the counsels of women been more sought after and attended to, many of the lamentable blunders that men have made in the treatment of children would have been avoided.”

Bye-Laws to be Framed by Local Bodies under Act of 1903.

After all these delays, the Employment of Children Act of 1903 conferred powers on the London County Council and the councils of other counties and boroughs to frame bye-laws to regulate Child Labor. Mrs. Alden, M.D., states:† “The Act contains regulations which, if they were enforced, would have great value. The failure to enforce the regulations is due largely to the laxity of local authorities, who have neglected to frame bye-laws, and who have failed in some cases to put into operation even the statutory provision of the Act.”

Bye-laws were framed by the London County Council in 1905, but only now, in 1908, are they at length to be enforced. The employment of children under eleven is forbidden. If attending school, children are only to be employed in industrial work at home between 5 p.m. and 8 p.m., or on other days between 9 a.m. and 12 noon, and between 5 p.m. and 8 p.m., or on Sundays. Three and a half hours are to be the maximum of work if attending school, and eight hours a day when the school is not open. If attending

* *The Children of the Nation*, by Sir John Gorst.

† *Child Life and Labor*, by Mrs. Alden, M.D., p. 110.

school they are not to be employed outside the home between 8 a.m. and 5 p.m., or before 6 a.m. or after 8.30 p.m. Street trading is regulated for all children under sixteen. Girls under that age are to trade only when accompanied by a parent or guardian. Boys under sixteen are to wear on the right arm a badge provided by the Council. On Sundays children are not to be employed for more than three hours and between the hours of 7 a.m. and 1 p.m.

But the enforcement needs more officers than are at present employed. A school attendance officer recently told the writer that in addition to his ordinary visiting (he has 3,200 children to look after), owing to these bye-laws, he has to be out in the streets until midnight on Saturdays in order to prevent children being employed beyond the legal hour—8 p.m. in the winter and 9 p.m. in the summer months.

In a return to the House of Commons dated June 25th, 1907, it is stated only sixty-six local authorities in England and Wales (out of more than 300), twenty-six in Scotland and five in Ireland had framed bye-laws.

The Prevention of Cruelty Acts.

The Act of 1894, among other useful provisions for the protection of children, made their employment in theatres or other places of entertainment conditional on the obtaining of a magistrate's licence, to be granted only when the magistrate is satisfied that the child is physically fit for the work and that proper provision has been made for its health and kind treatment. This Act has been amended and extended in the Act of 1904 and the Children's Act, 1908. The dangerous training of acrobats is subject to regulation.

The Education (Provision of Meals) Act, 1906-7.

This Act authorizes the levying of a halfpenny rate, if necessary, for the feeding of necessitous children, by any county, borough, or urban district council in England and Wales which is an education authority under the Education Acts of 1902-3. The Act, being permissive, has, in London, lamentably missed fire so far. Although members of the London County Council were moved to tears in the autumn of 1907 by Mr. Crooks' eloquent speech on behalf of the feeding of poor children, a majority of them voted against the levying of the halfpenny rate to buy food, for fear of placing additional burdens on the ratepayers. The London County Council, so far as concerns the feeding of necessitous children, contents itself with co-operating with private agencies and charitable societies, which are, in many cases, far from satisfactory. In Bermondsey the children have often to be given a penny by the head teacher and sent to the cook shops, as no provision can be made for them at the schools. The food provided by the caterers is often most unsuitable for children, especially for those who have delicate stomachs. Even if parents are able to provide food for their children in the slum districts, it is often of the most unwholesome kind, such as fried fish (bought cold), eels, meat pies, coarse parts of meat (especially pork), bloaters, cheap jam

and bread, vinegar and pickles, whilst tea is a universal drink. (The tea being more of the nature of a "stew" can hardly be called tea at all.) Milk porridge, bread and milk, and milk puddings are almost unheard of, whilst macaroni is unknown. The children's taste is vitiated by the strong flavored viands which they are given; and at first it is often difficult to get them to eat food suitable for their age and delicacy. Children fed at home are not infrequently sick over their desks in school. It is, of course, far easier for many parents to buy cooked food than to cook in their own poor rooms, with an impossible firegrate, no oven, no water supply, no sink, and no dustbin for vegetable refuse. To cater properly for the children, a system such as that prevailing in Bradford must be organized. In the matter of feeding the children England expects every city to do its duty at least as well as Bradford.

In the Report of the Inter-Departmental Committee on Physical Deterioration in 1904, Dr. Eichholz, one of H.M. Inspectors of Schools, estimated the number of underfed children in London at 122,000, or 16 per cent. of the whole.

Up and down the United Kingdom there are at least as many children at school hungry as in London. Dr. W. L. Mackenzie, Medical Member of the Local Government Board for Scotland, said that in the slums of Edinburgh a large proportion of children were half starved. Dr. Kelly, Roman Catholic Bishop of Ross, stated in 1904 that in the South of Ireland it was commonly the case that children came to school underfed.

Medical Inspection under Section 13 of Act of 1906-7.

This Act provides for the medical inspection of all school children. But though medical inspection is of the utmost importance, it is of little use without medical treatment and proper feeding. It is believed that half the children in the mentally defective schools are thus defective, or backward, owing to improper feeding or semi-starvation. Their brains are anæmic, their eyes are often sore, their ears deaf, their teeth ache, their heads and bodies are verminous. Such children, when grown up, swell the ranks of the unemployed and unfit, and will continue to do so until the scientific feeding of school children is undertaken.

There is no more instructive reading respecting the physique of children than the *Report by Dr. W. Leslie Mackenzie and Captain A. Foster on a Collection of Statistics as to Physical Condition of Children attending the Public Schools of the School Board of Glasgow*, which was issued by the Scotch Education Department.

This Report gives the results of the most extensive investigation ever undertaken in Great Britain as regards the physique of the children. The heights and weights of children in seventy-three schools in Glasgow were dealt with. Returns were obtained for 72,857 children in seventy-three schools, which were divided into four social groups, representing, among other things, the distribution of one, two and three or more roomed homes.

At each age from five to eighteen the weight of the children was found to be uniformly below the standard of the average of the

population as ascertained by the Anthropometrical Committee of the British Association. Up to the age of fourteen the children were distinctly below the standard.

Boys and girls in Group A, the poorest districts, fell very much below the anthropometric standard. At the age of ten the boys' average weight was 10·8 pounds below the standard, and the average height 2·9 inches below. At thirteen the average weight was 11·1 pounds below the standard, the average height 3·1 inches below. The facts were practically parallel with regard to the girls.

As surely as boys or girls came from Group A, the one-roomed group, the children were always on an average distinctly smaller and lighter than the children from the two-roomed group; and those from the two-roomed group were smaller and lighter than children from the three-roomed group; and those from the three-roomed group than the children from the four-roomed group. The Report says: "The numbers examined are so large, and the results are so uniform, that only one conclusion is possible, viz., that the poorest child suffers most in nutrition and growth. It cannot be an accident that boys from two-roomed houses should be 11·7 pounds lighter on an average than boys from four-roomed houses and 4·7 inches smaller. Neither is it an accident that girls from one-roomed houses are, on an average, 14 pounds lighter and 5·3 inches shorter than the girls from four-roomed houses."

Now, many of these undersized children are employed as wage-earning children. It is fair to assume that if as comprehensive a report were made of children in London as in Glasgow, the results would be equally startling.

Pernicious Effects of Street Trading.

As regards street trading, all the witnesses before the Inter-Departmental Committee and all inspectors, managers, members of education committees, and clergymen, are agreed that its influence on children is entirely pernicious. Mr. Chilton Thomas, who was for ten years Hon. Manager of Father Berry's Roman Catholic Homes at Liverpool, stated: "The more we have to do with street trading, the more baneful we find it. Would that it could be abolished. I do think the street trader is such a social leper that he ought to be kept quite apart from the errand boy who has some sort of trade for his after life." In 1892, Mr. Chilton Thomas said they had a home for these street trading boys. He had 3,000 of them pass through his hands; but they had to shut up the home, as they found it did not do the boys a bit of good without regulations by the City Council (now in force in a measure), and without the care of parents or guardians. He also said the hours of labor on Saturday were terrible.

As regards street trading for girls, Miss Florence Melly, formerly a member of the Liverpool School Board, stated: "Our day industrial evidence would go to this, that no girl remains good after fourteen years of age who has had street trading. 'Chip girls' and 'step girls' should be included, as they go from house to house and come in contact with anyone who opens the door."

Mr. Alderman Watts, Chairman of the Sub-Committee of the Watch Committee of Liverpool, said: "To have a pleasant looking child in the streets is flying in the face of the greatest possible danger. I have a strong opinion that if girls are kept out of the way of temptation during the earlier period of their lives, they will grow up respectable women; but if the temptation is thrown in their way, as it must be in the street, the danger is very great indeed. Liverpool a few years ago was, perhaps, one of the worst cities in this respect—as bad as London, in fact—but you will not find it here now. The death rate," Alderman Watts continued, "amongst children is abnormal and awful. Children cannot be exposed in the streets or elsewhere without very serious danger to their lives. Nine out of ten of little girls are of delicate frame."

Mr. Alderman Rawson, Chairman of the Watch Committee of Manchester City Council, said: "We are quite certain that the trading by girls in the streets leads to loose life. We have illustrations to that effect of a very painful character. The selling of newspapers and matches by girls in the streets is often a mere cloak for solicitation. There are girls that come from homes so bad, from parents so dissolute, that we believe the selling is simply a pretence, and that parents send them out knowing it is a pretence."

So much for the efficacy of parental control, guidance, and care under certain conditions of life. All the Councils of Liverpool, Nottingham, Birmingham, and Manchester were in favor of the total prohibition of street trading for girls.

But why only for girls? Sir Lambert Ormsby, President of the Royal College of Surgeons in Dublin, bore witness before the Inter-Departmental Committee on Physical Deterioration in 1904 to the miserable physique of the little street traders in Dublin and the frequent cases of pneumonia among them in the children's hospital, the death rate being quite abnormal.* And there is a consensus of opinion that it is from street trading boys that spring most of the unemployed, the casuals, the loafers, the gamblers, and many others who form the most difficult problems of modern society.

As a matter of fact, it is found that child labor and unskilled labor go hand in hand. For, in the first place, child labor is itself unskilled labor, and unskilled labor of a kind very attractive to certain employers. It is cheap; fresh supplies are always ready to hand; and, most important of all, it is intelligent unskilled labor, at any rate until the training of the school has lost its effect. Secondly, it leads to a supply of unintelligent unskilled labor. The child who is working cannot be learning, and the child whose mental development is checked is the child who becomes in later years the laborer too stupid to employ except at the lowest wages. Finally, even if he could escape from this dreary fate, he has no desire to do so. The bent has been given to his tastes; he has been taught to regard earnings, and not prospects, as his sole goal in life, and to sacrifice the last for the sake of the first. †

* *Juvenile Wage Earners and their Work*, by Miss Adler, p. 4.

† See *The Town Child*, by Reginald Bray, L.C.C.

As regards the general employment of children, the Head Master of the Anglesea Place Board School of Bristol declared that the evils of employment have shown themselves over and over again in the following ways:—

1. The boys are often late for school, some habitually so.
2. They come to school utterly worn out.
3. There is a grave moral deterioration.
4. Their mental power is diminished. It is very rarely a wage-earning boy does his school work well. The injury done to children is very great.*

In the Michael Faraday School in Walworth, Mr. Marshall Jackman said that, out of 227 wage-earning boys in his school, only 61 were in really good health. Dr. Thomas, the Medical Officer of the L.C.C., examined 2,000 children in schools, and he found that, out of 384 wage-earning boys, 233 showed signs of fatigue, 140 were anæmic, 131 had nerve signs, 63 per cent. showed nerve strain, 64 were suffering from deformities from the carrying of heavy weights, 51 had severe heart signs, 27 had severe heart affection, and 72 per cent. of barbers' boys were anæmic.†

Mrs. Pankhurst, at one time a member of the Manchester School Board and member of the Board of Guardians, stated that wage-earning by children was "demoralizing," and that "it would be distinctly an advantage to the parents in the long run that the children should be withdrawn from these employments. The more intelligent artizan does not believe in sending out his children to work for wages. . . . It competes with adult labor."

Child Labor in Agriculture.

In the agricultural districts the attendance at school is constantly evaded. It frequently happens that the local magistrates and county councillors are landlords or farmers, who must have cheap labor, even at the expense of the children's well-being. The children are employed in milking and tending cattle, in picking up stones off the land, in weeding, in picking strawberries (often at 3 a.m. in the season in all weathers), in hop picking, and in minding and leading horses. The work is extremely fatiguing. There is still in this twentieth century a wearing struggle between the educationist and the child exploiters, although it is not as bad as it used to be. In certain country districts 75 per cent. of attendances—instead of 95 per cent.—is still considered high.

The Childrens' Act of 1908.

But there are signs everywhere now of the awakening of the public conscience to the infamy of Child Labor. Although this Act does not deal directly with the labor question, there are, under it, to be established Juvenile Courts, in which all charges concerning the welfare of children will be heard, including applications for committal to industrial schools and reformatories.

* Report of Inter-Departmental Committee, Appendix No. 32.

† Barbers' shops in London are now, by bye-law, barred to boy workers.

The Immediate Reforms to Work for.

The evils disclosed are grave. Leaving aside for the moment all schemes of social reconstruction, what immediately practicable reforms will bring prompt, if only partial, remedies? There is a vast amount to be done by mere administration of the existing law. It may safely be said that no local authority yet makes anything like full use of its powers under the Education Acts, the Shop Hours Acts, the Children's Act, etc. An enormous amount of good would result if members of education committees and of town or county councils could be induced merely to put the existing laws fully in operation. But amendments of the law are urgently required. In agreement with practically all those who have studied the question, we recommend :—

1. That for children under five for whom adequate home care is not available, there should be a sufficient provision of small day nurseries, under the administration of the local health authority, where these infants can remain all day, either gratuitously or at fees representing only the cost of the food supplied.
2. That attendance at school of all children between five and fourteen be rigorously enforced (the poorest parents being adequately assisted to enable them to let their children attend), an adequate supply of suitable efficient schools being everywhere provided under due public control, including special schools for sub-normal children of various kinds, "open-air" schools and vacation schools.
3. That children in attendance at school be not permitted to be employed for hire under any pretence whatever.
4. That in order to ensure the welfare of the coming generation of citizens the responsibility for the care and maintenance of children of school age, being destitute, be transferred from the Poor Law to the local education authorities.
5. That it be made obligatory upon the local education authorities to organize throughout the whole year a system of providing, at the expense of the rates and under direct public control, suitable meals of a simple kind for all children found at school in an underfed condition; such meals to be provided under skilled and salaried supervision with the amenities of civilization.
6. That it should be made obligatory for every public elementary school to have attached to it a "Children's Care Committee" of members whose duty it should be to take cognizance of every child attending school in a neglected or necessitous condition; to visit its home and discover what is amiss; to afford such friendly help as may be required; and to bring to light any cases of ill-treatment which call for criminal prosecution.

7. That in all cases in which a child is provided for by what is now Poor Law relief, reports should be obtained upon its adequacy and the character of the home; and that where it is not considered expedient to grant to the parent enough for the full maintenance of the child, or where the child is found, in fact, to be suffering from lack of nourishment or lack of care, the child be sent to a day industrial school, where it will receive meals and care during the whole day.
8. That where it is found that the parents are of such vicious life and character as to be wholly unfit to have the care of children, the guilty parents should be criminally prosecuted for their neglect, and the children sent to residential schools, so as to secure their proper upbringing.
9. That the minimum age at which children may leave school to be employed in industry at all be raised at once to fourteen, and as soon as possible to fifteen (as in Switzerland).
10. That in view of the need of securing effective technical and domestic training for all boys and girls, the "half time" provisions of the Factory and Workshops Acts be extended for all industries up to the age of eighteen, no boy or girl under eighteen being allowed to be employed in industry for more than thirty hours per week.
11. That provision be made for the compulsory attendance of boys and girls between fourteen and eighteen at technical institutes for a combined course of physical training, technical education and continuation classes, absorbing the thirty hours per week which they will no longer give to their employers.

MARCH, 1909.

RENT AND VALUE.

ADAPTED FROM THE FIRST OF THE "FABIAN ESSAYS IN SOCIALISM."

PART I.—RENT.

SOCIALISTS, protesting against the present state of society, have lately been often met by two somewhat contradictory assertions. We are told that too much stress has been laid upon figures, statistics, and "dry" things such as political economy: that what is wanted is a "great wave of emotion," "genuine religious feeling," a "change of heart"; that these and these only will rectify the cruelties and injustices of the present state of society. And in the same breath it will often be illogically maintained that "you can't change human nature"; and that as human nature has brought about the present state of things it is no use trying to make any radical alteration.

Now I propose to shew that human nature, whether it can be changed or not, did not bring about the present state of things; but that it was rather the present state of things which brought about human nature; that the existing conditions of society are the result of economic laws which work inexorably, indifferent to the weal or woe of the human race, and unconscious of its existence. I also propose to shew that should the human race become conscious of the existence of such economic forces, and capable of directing them, these laws can be made to subserve man's welfare as powerfully as, left to themselves, they have been working for his destruction. A change of heart, if it be in the right direction, seems incidentally desirable; but by itself, and unaccompanied by the requisite knowledge of economic laws, it will be as useless as would be a wireless telegraphy station sending messages into space were there not somewhere a receiver to collect those messages.

The Origin of Rent.

Picture then to yourself a vast green plain of country, virgin to the spade, awaiting the advent of man. Imagine the arrival of the first colonist, the original Adam. He drives his spade into, and sets up his stockade around, the most fertile and favorably situated patch he can find. Metaphorically Adam's little patch is a pool that will yet rise and submerge the whole land. Other Adams come all sure to pre-empt patches as near as may be to the first Adam's, partly because he has chosen the best situation, partly for the pleasure of his society and conversation, and partly because where two men are assembled together there is a two man power that is far more than double one man power. And so the pool rises, and the margin spreads more and more remote from the centre, until the pool becomes a lake, and the lake an inland sea.

But in the course of this inundation that specially fertile region upon which Adam pitched is sooner or later all pre-empted and there is nothing for the newcomer to pre-empt save soil of the second quality. Also, division of labor sets in among Adam's neighbors ; and with it, of course, comes the establishment of a market for the exchange of the products of their divided labor. Now it is not well to be far afield from that market because distance from it involves extra cost for roads, beasts of burden, and time consumed in travelling thither and back again. All this will be saved to Adam at the centre of cultivation, and incurred by the newcomer at the margin of cultivation.

The Establishment of Rent.

Let us estimate the annual value of Adam's produce at £1,000 and the annual produce of the newcomer's land on the margin of cultivation at £500, assuming that Adam and the newcomer are equally industrious. Here is a clear advantage of £500 a year to Adam. This £500 is economic rent. For why should not Adam let his patch to the newcomer at a rent of £500 a year? Since the produce will be £1,000, the newcomer will have £500 left for himself ; that is, as much as he could obtain by cultivating a patch of his own at the margin ; and it is pleasanter to be in the centre of society than on the outskirts of it. The newcomer will himself propose the arrangement, and Adam may retire (not in consequence of any special merit of his own, any extra industry or brain power, but simply because he was fortunate enough to get the best place at the right moment) as an idle landlord with a perpetual pension of £500 of rent. The excess of fertility of Adam's land is thenceforth recognized as rent and paid, as it is to-day, regularly by a worker to a drone.

The Origin of the County Family.

So Adam is retiring from productive industry on £500 a year ; and his neighbors are hastening to imitate him as fresh tenants present themselves. The first result is the beginning of a tradition that the oldest families in the country enjoy a superior position to the rest, and that the main advantage of their superior position is that they enjoy incomes without working. Nevertheless, since they still depend upon their tenants' labor for their subsistence, they continue to pay Labor, with a capital L, a certain meed of mouth honor ; and the resultant association of prosperity with idleness, and praise with industry, practically destroys morality by setting up that incompatibility between conduct and principle which is the secret of the ingrained cynicism of our own time.

According to our hypothesis, the area of cultivation has now spread into the wilderness so far that at its margin the return for a man's labor for a year is only £500. But it will not stop there ; it will at last encroach upon every acre of cultivable land, rising to the snow line on the mountains and falling to the coast of the actual salt water sea, but always reaching the barrenest places last of all, because the cultivators will not break bad land when better is to be

had. But suppose that now, at last, the uttermost belt of free land is reached, and that upon it the yield to a man's year's labor is only £100. Clearly now the rent of Adam's primeval patch has risen to £900, since that is the excess of its produce over what is by this time all that is to be had rent free.

Dual Ownership.

Adam has yielded up his land for £500 a year to a tenant. It is this tenant accordingly who now lets Adam's patch for £900 a year to the newcomer, who of course loses nothing by the bargain, since it leaves him the £100 a year, with which he must be content any way. It has, in fact, come to this, that the private property in Adam's land is divided between three men, the first doing none of the work and getting half the produce; the second doing none of the work and getting two-fifths of the produce; and the third doing all the work and getting only one-tenth of the produce. Here is private property in full swing, produced (let us emphasize the fact) not in the least by "human nature," but by the natural working of economic laws of which the settlers were unconscious. Probably if the first colonists when they were still on their original patches had been asked "would you tolerate a state of things in which there should be not only loafers, but in which the loafers should be the richest people in the country," they would have repudiated the idea with profound and genuine indignation.*

All this, however, is a mere trifle compared with the sequel. When the total cultivable area has reached its confines; when there is nothing but a strip of sand round the coast between the furrow and the wave; when the very waves themselves are cultivated by fisherfolk; when the pastures and timber forests have touched the snow line; when, in short, the land is all private property, there appears a man in a strange plight: one who wanders from snow line to sea coast in search of land, and finds none that is not the property of someone else. On the roads he is a vagrant: off them he is a trespasser: he is the first proletarian.

Rent of Ability.

Now it may be that this second Adam, the first father of the great proletariat, has one of those scarce brains which are not the least of nature's gifts. If the fertile field yields rent, why not the fertile brain? Here is the first Adam's patch still yielding its £1,000 to the labor of the tenant who, as we have seen, has to pay

* The reader will observe that, to avoid complications, no mention has been made of capital as such. The monopoly of land produces the monopoly of capital. All capital begins as spare money, no matter what it may finally be turned into: mines, railways, canals, houses. In the first instance the possession of capital always means that some individual has received more rent than he desires or chooses to spend. Colloquially, one property with a farm on it is said to be land yielding rent; whilst another, with a railway on it, is called capital yielding interest. But economically there is no distinction between them when they once become sources of revenue. Shareholder and landlord live alike on the produce extracted from their property by the labor of the proletariat.

£900 away in rent. How if the proletarian were boldly to bid £1,000 a year to that man for that property and contrive—invent—anticipate a new want—turn the land to some hitherto undreamed of use—wrest £1,500 a year from the soil and site that only yielded £1,000 before? If he can do this, he can pay the full £1,000 rent, and have an income of £500 left for himself. This is his profit—the rent of his ability—the excess of its produce over that which it would yield to ordinary stupidity.

Origin of the Proletariat.

But in due replenishment of the earth there follows upon the footsteps of this first proletarian another who is no cleverer than other men, and can do as much, but not more, than they. For him there is no rent of ability. What is to be his fate? It is certain that by this time not only will the new devices of the renter of ability have been copied by people incapable of inventing them, but division of labor, the use of tools and money, and the economies of civilization will have greatly increased man's power of extracting wealth from nature. So that it may well be that the produce of land on the margin of cultivation, which, as we have seen, fixes the produce left to the cultivators throughout the whole area, may rise considerably.

Scarcity Value.

This rise has nothing to do with the margin of cultivation. It is not the difference between the best and worst land. It is not, to put it technically, "economic rent." It is a payment for the privilege of using land at all—for access to that which is now a close monopoly; and its amount is regulated, not by what the purchaser could do for himself on land of his own at the margin, but simply by the landowner's eagerness to be idle on the one hand, and the proletarian's need of subsistence on the other. In current economic terms the price is regulated by supply and demand. As the demand for land intensifies by the advent of fresh proletarians, the price goes up and the bargains are made more stringent. Sooner or later the price of tenant right will rise so high that the actual cultivator will get no more of the produce than suffices him for subsistence. At that point there is an end of sub-letting tenant rights. The land's absorption of the proletarians as tenants paying more than the economic rent stops.

Advent of the Proletarian.

And now what is the next proletarian to do? For all his fore-runners we have found a way of escape; for him there seems none, for where is his subsistence to come from, if he cannot get at the land? Food he must have, and clothing; and both promptly. There is food in the market, and clothing also; but not for nothing. Hard money must be paid for them, and money can only be procured by selling commodities. This presents no difficulty to the cultivators of the land, who can raise commodities by their labor; but the proletarian, being landless, has neither commodities nor the

means of producing them. Sell something he must: yet he has nothing to sell—*except himself*.

The first “Hand”: “Laborer”: “Mechanic”:
“Servant”: “Wage-Slave.”

The idea seems a desperate one; but it proves quite easy to carry out. The tenant cultivators of the land have not strength enough or time enough to exhaust the productive capacity of their holdings. If they could buy men in the market for less than the sum that these men's labor would add to the produce, then their purchase would be sheer gain. Never in the history of buying and selling was there so splendid a bargain for buyers as this. Accordingly the proletarian no sooner offers himself for sale in “a new country” than he finds a rush of bidders for him, each striving to get the better of the others by offering to give him more and more of the produce of his labor, and to content themselves with less and less of the surplus. But even the highest bidder must have some surplus or he will not buy. The proletarian, in accepting the highest bid, sells himself openly into bondage. He is not the first man who has done so; for it is evident that his forerunners, the purchasers of tenant right, had been enslaved by the proprietors who lived on the rents paid by them. But now all the disguise falls off: the proletarian renounces not only the fruit of his labor, but also the right to think for himself and to direct his industry as he pleases. The economic change is merely formal: the moral change is enormous. We shall see presently what happens in “an old country” when the rush of buyers of labor becomes a rush of sellers.

PART II.—VALUE.

It is evident that in our imaginary colony labor power is now in the market on the same footing as any other ware exposed for sale: it can be purchased as men purchase a horse or a steam engine, a bottle of wine or a pair of boots.

Exchange Value of Human Beings.

Since human labor therefore turns out to be a commodity, marketable just as a basket of eggs or a woollen shirt is marketable, if we want to know what is going to happen to our proletarian in a state owned by private individuals, as our colony is owned, we must proceed to find out what fixes the price of commodities in general (since his price will be fixed in the same way); and what causes the series of arrangements between buyers and sellers which have been named “supply and demand,” for our proletarian is now supplying *himself* in answer to a demand.

Contradictions and difficulties soon show themselves.

It would seem on the surface that the selling value, or exchange value, of anything must depend upon its utility, for no one will buy a useless thing. Yet fresh air and sunlight, which are so useful as to be quite indispensable, have no money value; whilst for a

meteoric stone, shot free of charge from the firmament into your back garden, the curator of a museum will give you a considerable sum. A little reflection will show that this depends upon the fact that fresh air is plentiful and meteoric stones scarce.

Scarcity Value.

If by any means the supply of fresh air could be steadily diminished, and the supply of meteoric stones, by celestial cannonade or otherwise, steadily increased, the fresh air would presently acquire an exchange value which would gradually rise; whilst the exchange value of meteoric stones would gradually fall, until at last fresh air would be supplied through a meter and charged for like gas, and meteoric stones would become as unsaleable as ordinary pebbles. The money (or exchange) value, in fact, decreases as the supply increases; or, in other words, as the supply pours in the demand falls off, until finally, if the supply continues to pour in, the demand ceases altogether and what is left of the supply is valueless.

How Exchange Value is Fixed.

But besides this fact of the exchange value of any commodity being dependent upon the amount there is of it in any market at any one time, another equally important fact must be carefully mastered, viz., that the value of our commodity is fixed not by the rarest and most useful part of the stock of it, but by the least costly and least useful. This can be explained quite simply by an illustration. If the stock of umbrellas in the market were all alike and sufficiently large to provide two for each umbrella carrier in the community, then, since a second umbrella is not so necessary as the first, the instinctive course would be to ticket half the umbrellas at, say 15s., and the other half at 8s. 6d. But no man will give 15s. for an article which he can get for 8s. 6d.; and when people came to buy, they would buy up all the 8s. 6d. umbrellas. Each person being thus supplied with an umbrella, the remainder of the stock, though marked 15s., would be in the position of second umbrellas, only worth 8s. 6d. It may very likely occur to the reader that if he was the seller of umbrellas, he would charge 15s. all round and put away half his stock until the number of umbrellas actually and immediately necessary to his fellow townsmen was sold. But a moment's reflection will remind him that there will be other tradesmen in the town who sell umbrellas. In the next street will be a shop where umbrellas can be purchased for 10s. 6d., and near by another where they can be had for 7s. 6d.; so that, granted all the umbrellas are of the same quality, the customers will go to the shop where they are to be had for 7s. 6d., and my reader's 15s. ones will remain on his hands unsold.* The only limit to this "competition" is obviously the actual cost of the manufacture of the umbrella. One more illustration of a different kind. You want to get and sell

* There is indeed another way. The reader might buy up all the umbrellas in the town and arrange that none should be brought in from anywhere else. This is to "corner" the market—but that is another story.

coal. You begin by going to the point where coal is on the surface—where you can shovel it up with ease. But when that supply is exhausted, you must sink a shaft; you must burrow under ground, eviscerate mountains, tunnel beneath the sea, at an enormous cost in machinery and labor. Yet when you have made your greatest effort, another man may still be in possession of a mine near the surface where he gets his coal for half, a quarter, a tithe of the labor you expend upon yours. In spite of this, when you both bring your coal to market and offer your supplies for sale, you cannot say “I have been at great expense to get mine and I will charge 20s. a ton.” Your rival is offering his for 15s. a ton, and you must sell at the same price or you will get no customers. Let us suppose that it has cost you 18s. per ton to get your coal, and that it has cost him 5s. per ton to get his, the whole difference between the 5s. and the 18s. is economic rent gained by him, not by superior industry or ability (for it is you who have had these), but by the fact of his privately owned coal mine being in a more advantageous situation than yours. In this manner the exchange value of the least useful and least costly part of the supply fixes the exchange value of all the rest.

The Law of Indifference.—Final Utility (Marginal Utility).

Technically this is called the Law of Indifference. And since the least useful unit of the supply is generally that which is last produced, its utility is called the *final utility* of the commodity.

Total Utility.

The utility of the first and most useful unit is called the *total utility* of the commodity.* The main point to be grasped is, that however useful any commodity may be, its exchange value can be run down to nothing by increasing the supply until there is more of it than is wanted. The excess, being useless and valueless, is to be had for nothing; and nobody will pay anything for a commodity so long as plenty of it is to be had for nothing. This is why air and other indispensable things have no exchange value, whilst scarce gewgaws fetch immense prices.

These, then, are the conditions which confront man as a producer and exchanger. If he produces a useless thing, his labor will be wholly in vain: he will get nothing for it. If he produces a useful thing, the price he will get for it will depend on how much of it there is for sale already. This holds good of the whole mass of manufactured commodities. Those which are scarce, and therefore relatively high in value, tempt men to produce them until the increase of the supply reduces their value to a point at which there is no more profit to be made out of them than out of other commodities. And this process, unless deliberately interfered with, goes on until the price of all commodities is brought down to their cost of production.

* Some economists, transferring from cultivation to utility our old metaphor of the spreading pool, call final utility “marginal” utility.

Cost of Production.

But here is a new question. What does the *cost of production* mean?

We have seen that, owing to the differences in fertility and advantage of situation between one piece of land and another, cost of production varies from district to district, being highest at the margin of cultivation. But we have also seen how the landlord skims off as (economic) rent all the advantage gained by the cultivators of superior sites and soils. Consequently, the addition of the landlord's rent to the expenses of production brings those expenses up even on the best land to the level of those incurred on the worst. Cost of production, then, means cost of production at the margin of cultivation, and is equalized to all producers, since what they may save in labor in favorable situations is counterbalanced by the greater amount of rent they have to pay in those situations. So far from commodities exchanging, or tending to exchange (as some economists allege that they do), according to the labor expended in their production, commodities produced in the most favorable situations, well inside the margin of cultivation, with the minimum of labor, will fetch as high a price as commodities produced at the margin with the maximum of labor. *And all the difference between the two goes to the landlord.* So man's control over the value of commodities consists solely in his power of regulating their supply. Individuals are constantly trying to decrease supply for their own advantage. Gigantic conspiracies have been entered into to forestall the world's wheat and cotton harvests, in order to force their value to the highest possible point. Cargoes of East Indian spices have been destroyed by the Dutch as cargoes of fish are now destroyed in the Thames, to maintain prices by limiting supply. All rings, trusts, corners, combinations, monopolies, and trade secrets have the same object.

The Vital Point.

Now we have come to the most important part of this paper: the part which will explain why we Socialists are attacking this private monopoly system—this capitalist system—this *laissez faire* system—with all our strength and ingenuity. Go back to our proletarian. We found that he had come to our colony when all the land, from the sea to the snow line was occupied and owned; when the utmost rent of ability had been screwed out of it; and when its scarcity value had been exploited to the last penny. It was therefore impossible for him to produce any of the commodities by the sale (or exchange) of which men live. But we found that he had one commodity the sale of which he could effect with ease—the sale of himself. We found that men ("laborers," "hands," "mechanics," "working men," "servants"—how expressive words are!) were in the market, and traffic in them could be carried on precisely on the same terms as traffic in any other commodity.

Now reflect for a moment upon the laws we have been examining which regulate the exchange of commodities. We found that "if

the supply continues to pour in, the demand ceases altogether, and what is left of the supply is valueless." We also found that, by the Law of Indifference, "the exchange value of the least useful part of the supply fixes the exchange value of all the rest." What will be the result of the action of these laws upon the human commodity we have called a proletarian? The commodity he deals in is one over the supply of which he himself has practically no control. True, at first there is only one of him in our colony; but others pour in, population increases by leaps and bounds, soon there are twenty, one hundred, one thousand, five thousand, and men continue so to multiply that their exchange value falls slowly and surely until it disappears altogether. This is the condition of our English laborers to-day: they are no longer even dirt cheap: they are valueless. The proof of this is the existence of the unemployed, who can be had for nothing.

You will immediately say "no labor can be had for nothing": you will very likely add that you "wish it could," and instance the high wages given to "hands" and "servants." The answer is deplorably simple. Suppose horses multiplied in England in such quantities that they were to be had for the asking, like kittens condemned to the bucket. You would still have to feed your horse—feed him well if you used him as a smart hunter—feed him and lodge him wretchedly if you used him only as a drudge. But the cost of his keep would not mean that the horse had an exchange value. If you got him for nothing in the first instance, if no one would give you anything for him when you had done with him, he would be worth nothing, in spite of the cost of his keep. That is just the case of every member of the proletariat who could be replaced by one of the unemployed to-day. Their wage is not the price of themselves, for they are worth nothing; it is only their keep. If you have to give your footman a better allowance than your wretched hewer of wood, it is for the same reason that you have to give your hunter oats and a clean stall instead of chopped straw and a sty.

The Capitalist System Guilty.

This, then, is the economic analysis which convicts private property of being unjust from the beginning, and utterly impossible as a final solution of the problem of the distribution of wealth. All attempts yet made to construct true societies upon it have failed: the nearest things to societies so achieved have been civilizations which have rotted into centres of vice and luxury, and eventually been swept away by uncivilized races. It is sometimes said that during this grotesquely hideous march of civilization from bad to worse, wealth is increasing side by side with misery. Such a thing is eternally impossible; wealth is steadily decreasing with the spread of poverty. But riches are increasing, which is quite another thing. The total of the exchange values produced in this country is mounting, perhaps, by leaps and bounds. But the accumulation of riches, and consequently of excessive purchasing power

in the hands of one class, soon satiates that class with socially useful wealth, and sets it offering a price for luxuries. Luxuries are not social wealth: the machinery for producing them is not social wealth: labor skilled only to manufacture them is not socially useful labor: the men, women, and children who make a living by producing them are no more self-supporting than the idle rich for whose amusement they are kept at work. It is the habit of counting as wealth the exchange values involved in these transactions that makes us fancy that the poor are starving in the midst of plenty. They are starving in the midst of plenty of jewels, velvets, laces, equipages, and racehorses; but not in the midst of plenty of food. In the things that are wanted for the welfare of the people England is abjectly poor. Yet private property, by its nature, must still heap the purchasing power upon the few rich and withhold it from the many poor.

Conclusion.

Now Socialism claims to have discovered in this private appropriation of land the source of those unjust privileges which the Socialists seek to abolish. They assert that *public property in land and the means of production is the basic economic condition of Socialism*. How the economic change from private to public ownership can be brought about with the least suffering to individuals does not come within the scope of this paper; but if we have got as far as an intellectual conviction that the source of our social misery is no eternal wellspring of confusion and evil, not the depravity of human nature or the hardness of human hearts, but only an artificial system susceptible of almost infinite modification and readjustment—nay, of practical demolition and rearrangement at the will of man, then a terrible weight will be lifted from the minds of all except those who are clinging to the present state of things from base motives. It is to economic science—once the dismal, now the hopeful—that we are indebted for the discovery that though the evil is enormously worse than we knew, yet it is not eternal—not even very long lived, if we only bestir ourselves to make an end of it.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. 3d., post free 4d.
"THOSE WRETCHED RATES!" a Dialogue. By F. W. HAYES. 1d.

TRACT INDEX AND CATALOGUE RAISONNÉ. 3d.

FABIAN ESSAYS IN SOCIALISM. New Preface by BERNARD SHAW
Paper 6d. net; cloth 1/6; postage 2½d. and 4d.

FABIAN TRACTS AND LEAFLETS.

Tracts, each 16 to 52 pp., price 1d., or 9d. per doz., unless otherwise stated.

Leaflets, 4 pp. each, price 1d. for six copies, 1s. per 100, or 8/6 per 1000.

The Set of 78, 3s.; post free 3/5. Bound in Buckram, 4/6 net; post free 5s.

I.—General Socialism in its various aspects.

TRACTS.—139. Socialism and the Churches. By Rev. JOHN CLIFFORD, D.D.

JULY 1909.

MACHINERY: ITS MASTERS AND ITS SERVANTS.

"It was through machinery," wrote Toynbee in his "Industrial Revolution," "that the population was drawn out of cottages in distant valleys by secluded streams and driven together into factories and cities."

The "Industrial Revolution" was published as far back as 1884, and since then economists and historians have constantly borne witness to the immense and far-reaching results of the introduction of machinery; but society has, as yet, come to no conclusion on the question, how far machinery as a means of stimulating and satisfying the material and moral needs of a progressive community is really valuable. Unfortunately, there is little hope that society will be able to make up its mind on the point; for even its more progressive members, its statesmen and reformers, have, so far, failed to realize the importance of machinery as a factor in what is optimistically called "modern civilization."

Society is becoming to an increasing extent a machine created and machine supported organism. While moralists and politicians are discussing the social welfare, mechanical appliances are continually producing fresh social problems and are offering new remedies.

It is not surprising that the Victorians, astounded by the great revelations of power which machinery held out to them, could see few blemishes in that great force. Nineteenth century optimism and laissez faire, like twentieth century Collectivism, was largely a machine made product. It was an age of machine worship; now we have become more sceptical.

For it is coming to be recognized that great as are the gifts of machinery in endowing man with new liberties, in amplifying his senses and thoughts, they have been, for the greater part, the endowments of the wealthy alone. The man without means is a machineless man, he is a primitive; he can travel on his feet alone, he can hear only with his ears. The railway and the telephone are the monopolies of the more wealthy.

As men increase in wealth, so is their power over nature augmented, while those very persons who spend their lives in minding machinery, who are often killed, maimed, or poisoned by it, are the very ones least able to avail themselves of its services.

But if the introduction of machinery has been the cause of great and unnecessary human suffering, it has also conferred great benefits upon the working classes through facilities for travel, the provision of cheap books, the material means of education, and generally by

their now wider outlook upon life. As all these are largely due to machinery, the modern social reformer, while repudiating the shallow optimism of the Manchester School, knows that he cannot put back the clock and revive the Middle Ages.

In any case we must realize that machinery has come to stay. The very fact that the enormous increase of population in the last 150 years dates definitely from the beginning of the "industrial revolution," and is, for the most part, due to the development of machine production, shows that any return to less copious methods in the manufacture of the prime necessities of life is out of the question.*

Again, foreign trade, the necessity to obtain by exchange commodities which cannot conveniently be produced at home, demands an ever increasing efficiency and economy in competitive international export production; a necessity which further commits us to the use of highly specialized appliances.

But great as have been the changes effected by machinery in the past, its influence upon the social organism is by no means exhausted, and even greater changes may be looked for in the future.

In endowing man with increased powers over the material world, machinery has only hastened his evolution. Its advent was a necessary and inevitable step of human development, for it is, to a great extent, through the reaction of material progress upon man that spiritual progress will be attained.

Already the fast ocean-going freight steamer, the railway train, and industrial machinery in general, have made possible the growth of world markets, the inter-dependence of nations, and the inter-communication of one country with another, with the result that workers all over the world are beginning to recognize the singleness of their aims, and to feel a disinclination for war.

Thus machinery, which, in the hands of irresponsible people, has proved so potent a factor in creating modern industrial life, with its hideous factories, barrack-like buildings called workmen's homes, and dreary congested manufacturing towns, and which has caused the depopulation of the countryside through the urbanizing of the agricultural laborer, must, by demanding ever greater organization, higher capacity and wider education for its successful exploitation, eventually bring about a change of outlook in the minds of the industrial workers.

They will come to see that machinery, to the manipulation of which they devote so large a portion of their lives, far from being their servant, has, in the hands of the capitalist, limited liability company and trust, been used mainly for the enrichment and satisfaction of a small privileged class and for their more complete subjection.

* Before 1751 (though prior to 1801 we have to depend on estimates only) the largest decennial increase was 3 per cent. For each of the next three decennial periods the increase was 6 per cent. Then between 1781 and 1791 it was 9 per cent.; 1791 to 1801, 11 per cent.; 1801 to 1811, 14 per cent.; 1811 to 1821, 18 per cent. After this the normal rate of increase, owing to emigration, fell to 12 per cent.; 1821 to 1831, 15·8 per cent.; 1831 to 1841, 14·4 per cent.; 1841 to 1851, 12·89 per cent.; 1851 to 1861, 11·9 per cent.; 1861 to 1871, 13·21 per cent.; 1871 to 1881, 14·36 per cent.; 1881 to 1891, 11·65 per cent.; 1891 to 1901, 12·17 per cent. (Census Returns for England and Wales.)

I.—MACHINERY UNDER THE PRESENT SYSTEM OF PRODUCTION FOR PRIVATE PROFIT.

So greatly indeed has machinery increased the capacity of man to utilize the forces of nature for his own purposes, that were no further advances to be expected in mechanical discovery, our present power and knowledge, if rightly used, would be more than sufficient to guarantee a minimum of decent comfort to every member of the community.

Nevertheless it is unfortunately only too evident that although machinery has given us the means of satisfying all reasonable material needs, and this with an economy of labor which gives us ample time to satisfy and develop our more spiritual desires, although we have the means, the end seems very far from attainment.

To realize not only why this is so, but, further, why, far from being a blessing, machinery very often proves a curse and causes much needless human suffering, it is necessary to examine those conditions which more immediately determine why, when, and where machinery shall be employed, how it shall be used, and to what purposes it is put.

Why Machinery is Produced.

Its existence is, in the last resort, dependent upon the inventor. Few large employers of labor, although they may know very well what they want, have either the time or ability to think out or perfect machines which will meet those wants.

But, like any other commodity, machinery obeys the laws of supply and demand; and since the demand for labor saving machinery comes from the capitalist with a view to cheaper production, its appearance primarily depends upon its prospects as a profit maker.

Thus the tendency is for inventors (who, like any other producers wishing to sell in the open market, must produce saleable goods or starve) to devote their inventive faculties to the evolution of labor saving machinery.

It follows then that, with the exception of such small demands as are made for appliances for scientific and other non-commercial purposes, the inventive brains of the world are in great part confined to the production of such machinery as will expeditiously supplant the dearer and less dependable manual labor.

Though great epoch making discoveries have, in response to no capitalist demand, from time to time revolutionized the industrial world, by far the greater part of invention has not been done by the actual "discoverers," who are but few and far between, but by the ordinary run of engineers, who, one inventor developing this, another modifying that, improve upon the original conception until a highly efficient machine, the product not of one man, but of many, is evolved.*

* See "The Evolution of Modern Capitalism," J. A. Hobson, ch. iv. § 6.

This is the process of evolution of most industrial machinery. The highly specialized machines of to-day are but the result of many inventors working upon the original discoveries of the eighteenth and early nineteenth centuries.*

But even the original discoverer, although he may not be directly affected by the unsocial profit seeking demand of the manufacturer, falls a victim to the system of society created by private capitalism. For since in many cases he must obtain the aid of the financier before he can even perfect his invention or produce it as a saleable commodity, it invariably happens that the financier exploits him and his invention for his own individual profit, with no idea of social service. Even when the inventor is in a position to be his own capitalist, living in a world of profit seeking, he does as he sees others doing, and puts his invention on the market in such a way as will ensure his realizing the highest returns. Although the immediate general use of the invention might be of the greatest advantage to society, its sale is regulated by one consideration only, that of making as much money as possible. The method being first to place it on the market in small quantities at a high price, this price is maintained until it has drawn its full toll from the comparatively few members of society who can afford to buy at that price. It is then sold at a lower figure in larger quantities till that wider grade of demand shows signs of being satisfied. Then, if the cost of production will allow of it, the process of lowering the sale price and increasing the output is again repeated; and so on till it is discovered at what price and in what quantities it will return the highest profits to its exploiters.

Thus we see, firstly, that the inventor himself cannot rightly lay claim to be solely responsible for the invention of his machine, and demand the full economic advantage afforded to society by its use, but is himself a social product whose power to invent is due to the fact that others have invented before him, and thus given him something upon which he may improve; secondly, that unless he is one of those few rich inventors who are independent of the capitalist, he cannot, even if he would, extort what has been called his "rent of ability" from the sale of his machine, but is compelled to ask the financier's help to enable him to put it on the market. In which case he often finds that, after paying the cost of production and such profit as the manufacturer, the middleman, and the financier claim as their respective shares of the booty, there is very little left for himself.

In fact many an inventor would be pleased to get anything at all. The intelligent workman in the factory who devises some small improvement in the method of production often sees his invention put into use without himself being a penny the richer.

And, lastly, we see that since it is generally left to the tender mercies of the capitalist to shape the direction in which inventive genius shall be expended, and to determine when and how an

* Even in 1857 cotton spinning machinery was supposed to be a compound of about eight hundred inventions, and the carding machinery a compound of sixty patents. (Hodge's evidence before House of Lords Committee, 1857).

invention shall be given to the world, society as a whole is in a very weak position, and must often wait his pleasure for some invention the immediate adoption and development of which would be of the greatest social service; and that when it is eventually placed upon the market, it is engineered in such a way as to ensure that society shall pay the full price.

This, then, is how the system of production for private profit reacts harmfully upon both the individual inventor and the whole community.

When and Where Machinery is Employed.

While there exist certain industries where work of great accuracy is essential and which consequently are almost entirely dependent upon machinery for their existence; while on the other hand there are many undertakings of a quasi-artistic nature in which the human equation effectively forbids the employment of mechanical methods, such as some metal trades and in pottery and glass-making, where personal skill is still needful, it will be found that the great mass of machinery has been devoted to supplanting routine manual labor.

A most striking proof of the connection between cheap labor and handwork is furnished by the case of a large printing works, visited by an investigator appointed by the Interdepartmental Committee on Physical Deterioration, 1904, where women were employed in folding one of the illustrated weekly papers. Folding machines which required men to tend them were standing idle in the department and were used only when folding had to be done at the times when the Factory Law prohibited the cheaper labor of the women.

"The general economies of machinery," says Mr. J. A. Hobson, "are found to be two. (1) The increased quantity of motive force it can apply to industry. (2) Greater exactitude in the regular application of motive force (a) in time—the exact repetition of the same acts at regulated intervals; (b) in place—exact repetition of the same movements in space. All the advantages imputed to machinery in the economy of human time, the utilization of waste material, the display of concentrated force, or the delicacy of manipulation, are derivable from these two general economies." ("Evolution of Modern Capitalism," Hobson, ch. iv., p. 66.)

Hence, wherever the efficiency of labor depends chiefly upon the output of muscular force in motive power, or precision in the regulation of such force, human labor will, sooner or later, give way to machines.

But there are other factors which determine whether machinery shall supersede hand labor. There is the effect of the Factory Acts. These have had influence in two ways:—

Directly, by hastening the introduction of labor-saving processes in small firms, when it might otherwise be delayed. Here machinery is often only employed when restrictions as to hours of labor begin to be felt. The restrictions placed upon child labor by limiting the legal working day in tobacco trades caused the introduction of steam power to turn the spinning wheels. The same result followed from the Act of 1864 in lucifer match factories; and at the present day the most complicated American machinery is used in some lucifer

match works, hand labor merely feeding the machines and placing the match boxes in their outer covers. This machinery has evidently been introduced owing to trade competition, but there is no doubt that besides the effect of the restrictions on child labor, the special rules in force in regard to lucifer match factories have stimulated the introduction of machinery which reduces the danger of phosphorus poisoning to a minimum.

In letterpress printing works and in paper and envelope-making works machinery has been introduced to obviate the inconvenience arising from the restriction on overtime employment.

These are but single instances of a tendency which must be at work wherever employers are precluded from competing with one another by means of long hours and low wages. The only resource then left to them is to compete by means of improved industrial methods ; and thus :

Indirectly, by giving competition an upward tendency, the Factory Acts have produced a demand for more and continual improvements in machinery.

Again, machinery is expensive ; the return on outlay if great, is slow, and to some extent doubtful. In order that the factory may be run profitably, it is imperative that the demand for its products shall be continuous. Much expensive machinery will only save labor when it is used to assist in producing a large output which can find a steady market.

During the last fifty years a larger and larger proportion of machinery has been devoted to the construction of further machinery for industrial purposes. That is in itself a highly speculative undertaking, and therefore it has become increasingly necessary in the interests of profitable production that sporadic competition should be suppressed and demand regularized and we see in the trust and combine a final effort on the part of the capitalist to achieve that artificial regularity of production, which the expenses and maintenance of enormous machine plants have rendered inevitable.

Finally, then, machinery has come to be devoted almost solely to labor saving ; which function it can only perform successfully when both the quality and quantity of its product are steady and constant and not open to sudden, unforeseen fluctuations.

The Conditions under which Machinists Labor.

Machinery, if its use be not carefully regulated and supervised, is often highly dangerous. At present mechanical production in this country results in the sacrifice of no less than over a thousand lives and over ninety thousand reported accidents in each year : 4,221 persons were killed and 116,439 injured in one year (1903) in all industrial accidents. ("Riches and Poverty," Money, p. 124.)

Although agitation has already produced some regulations for the fencing of dangerous machinery, and done something to protect the worker from the ruthlessness of competitive individualism, each year brings forth its long list of casualties and deaths.

In 1908, the total number of accidents occurring in factories and workshops in England and Wales amounted to 122,154, of which 1,042 were fatal. In 1898 the total reported was 57,562, of which

727 were fatal. 727 cases of poisoning are reported for 1908 as against 653 for 1907.

The Board of Trade Report on Railway Accidents during the year 1908 shows that 384 railway servants were killed and 5,140 injured by accidents on the lines. In 1904, ten were killed and 542 injured whilst coupling or uncoupling vehicles. In 1907, one shunter in every thirteen was killed or injured at his work on the railway; and yet the automatic coupling and some improved and uniform brake for goods wagons still remain to be adopted by the railway companies of England. It is because it would put the companies to *too great expense* that nothing is done in the matter.

In the Factory Report for 1908 it is pointed out, in connection with the steady increase in the number of reported accidents that, besides the constant tendency in factories to substitute power machines for manual work, and to increase the speed of machines generally, there is a further tendency noticeable in many factories, which also affects the accident rates. Very many new milling machines have recently been installed to do work that was formerly done by the safer and slower shaping, planing, and slotting machines, and by certain types of lathes. The use of power presses is also increasing. These dangerous machines are now used for much work that was previously done by forging and casting processes and by hand.

The actual number of accidents is far greater than the official returns would lead us to suppose; for many slight accidents are not reported, though such casualties may often develop later into a permanent partial disablement. The published returns of the fatal accidents to railway servants fall far short of the truth, because only those accidents which cause rapid death are reported as fatal.

The Deputy Chief Inspector of Factories for 1908 states that higher speed, increased use of machinery, and better reporting have all had a tendency of recent years to keep up the number of recorded accidents, and to obscure to a certain extent the fact that working conditions as regards machinery are relatively safer now than they were some years ago. The changes in the law introduced by the Notice of Accidents Act, 1906, are not yet properly understood, and, comparatively speaking, very few "dangerous occurrences," *i.e.*, certain accidents without injury to persons, have been notified. A number of accidents due to cuts and scratches, which are of daily occurrence in large works, and so slight as not to interfere with work for more than an hour or so at the time, now become reportable under the Act, because, owing to want of care or proper dressing, inflammation or blood poisoning is often set up, and causes prolonged absence from work at a later period. Several inspectors attribute accidents to recklessness and disobedience on the part of workers, though the lady inspectors do not agree with this opinion as regards laundries. It is no doubt true, however, that serious accidents are sometimes brought about by the workers' own recklessness; but this is contributed to in some industries by the system of piecework now so prevalent.

The "economies" resorted to by the individual employer in his desire to reduce the costs of production to a minimum are respon-

sible for a large proportion of accidents. In the Annual Report of the Chief Inspector of Factories and Workshops, 1904, a table is given showing that the greatest number of accidents in laundries occur when the operative is most fatigued, in the hour before dinner and in the later period of the afternoon spell. The long hours of arduous work result in carelessness, and so in accidents.

In the same report for 1906 it is pointed out that whereas the total number of accidents affecting men and boys stands in 1906 at the mean figure for five years, the number affecting women and girls has risen by nine above the mean figure. This is due to the growing use of ironing machinery and the increasing employment of young unskilled girls in working and cleaning it. The report of the Departmental Committee appointed to enquire into the dangers attendant on building operations, 1907, shows that a large number of accidents are preventible, and are due to the lack of competent foremen and skilled supervision and the putting of unskilled men to skilled work for the sake of cheapness.

Further, in 1908 there were only 200 inspectors to supervise 260,000 factories, an average of 1,300 for each inspector, and it is notorious that when factories have been immune from inspection for a considerable time even the statutory accidents fail to get reported.*

Moreover, apart from casualties, the optimistic conclusions of Professor Marshall as to the beneficial effects of machinery in lessening the strain upon the worker engaged in monotonous occupation † is open to the objection that though machinery undoubtedly diminishes the purely muscular strain, there is evidence to show that it taxes the nervous vigor of the operative quite as severely as the old manual work, for the intensity of modern competition forces the organizers of labor to extract as much out of their employees as they possibly can. Even where there has been a reduction in the hours of the working day, it does not follow that the amount of energy required of the workers is any less.

But many workers still toil for excessive hours. The prosperous artisans who have nominally won the nine hours day form but a small minority. The men who work on the tramcars in our

* According to a return published by the Board of Trade the total number of deaths from industrial accidents reported in 1908 was 4,224, a decrease of 253 on 1907, but an increase of 29 on the mean of the five years 1904-8. A decrease is recorded in every group of occupations except mining and quarrying. The results show the mean annual death-rate from accidents per 10,000 employed in each group of trades, and are given in the following table :—

Seamen	50·4
Miners	13·2
Quarrymen	10·6
Railway Servants	7·5
Non-Textile Factory and Workshop Operatives	2·2
Textile Factory Operatives	0·8
For all Occupations enumerated above	6·3

The industries included in this table employed over six millions of workpeople.

During 1908, 35,000 workmen were killed and 2,000,000 injured in the United States of America. One person in every eight families sustained injuries. The Labor Bureau Report suggests that America is behind Europe in safeguarding the lives of operatives, and declares that one-half to one-third of these casualties could have been avoided by rational factory legislation, inspection, and control.

† "Principles of Economics," pp. 314, 322, Professor Marshall. Second edition.

cities are often on duty for at least fourteen hours a day, without including meal times. Nearly all the great railway companies have thousands of men at work for twelve hours at a stretch, with a great deal of Sunday labor. Until the coming into force of the Miners Eight Hours Act, 1908, many even of the coal hewers were underground for more than nine hours a day; and there are other classes of machine workers, such as blastfurnace men and steel workers, whose day's labor normally is at least twelve hours. Even when, as in the case of the engineer, the normal hours of labor have in some places been reduced from sixty to fifty per week, this reduction has been largely neutralized by overtime.

The Effect of Labor Saving Machinery upon Employment.

It is not only with the loss of life and limb and the exhausted bodies of the overtaxed factory hand that the penalty of modern industrialism is paid.

Such existence even as the workman is able to maintain when in employment is always affected by the uncertainty of his occupation, an uncertainty dependent upon external causes, over which he has no control whatever. Subject, perhaps, merely to the whim of his employer, to a change of fashion, to the very advance of those methods of machine power and process which should rightly bring him shorter hours and lighter labor—his living is in the highest degree precarious.

Under the stress of competition, and, perhaps, in some way due to such Acts as the Workmen's Compensation Act, there is a growing tendency among employers to scrutinize very carefully the men whom they take into their service, in order that, in return for the standard rates of wages they have to pay, they may get the most efficient workmen. Thus it becomes increasingly difficult for the worker in any way below the average to obtain employment at all.

Though it is true that the supplanting of hand labor by machinery has not lessened the demand for labor as a whole, yet it is undeniable that the individual worker often suffers under the change. The floating of new inventions results in dislocation of employment and in unemployment, with all the suffering they entail.*

The displacement of the hand weaver by the power loom, the slow but sure death of the chain and nail trade in the "Black Country," the substitution of cheap female labor in the Leicester boot factories to attend power driven machinery in the place of the former male hand work, the rise of the motor driven cab, are but instances of this inevitable tendency.†

* See "Unemployment: a Problem of Industry," by W. H. Beveridge. 1909, p. 111, under "Employment of Declining Trades"; Minority Report, Poor Law Commission, 1909, p. 1147; "Final Report on Industrial and Sanitary Conditions to Pauperism," by Steel Maitland and Squire.

† In 1908 as many as 2,925 taxicabs were licensed to ply for hire in the streets of London, an increase of 2,202 upon 1907. In the same twelve months the number of hansom cabs licensed decreased by 1,205; since 1903 the number of hansoms has declined by 2,752. Besides the actual cabdrivers, the motor car is displacing grooms, harness makers, stablemen, and others.

Except through Trade Union action the worker has derived little or no benefit in wages from improvements in machinery, from cheaper output; the surplus profit produced by greater efficiency of production and transit goes inevitably into the pockets of the capitalist and landlord. Hours of labor grow no shorter, toil becomes no less degrading and onerous, that compensation which at times flows so generously into the coffers of the monopolist, benefits in no way the employee, when the industry in which he is engaged is discontinued through no fault of his own. His wages are beaten down, his labor often supplanted by that of his wife and children, with the consequent injury to their health and physical deterioration in following generations.

For it is evident that the married woman who all day long has to work hard in a mill or factory can have but little energy left at the end of the day for housework, for looking after the needs of her children, or even for fitting herself for the rearing of a family.

The children accordingly are given unsuitable food and but scanty attention. They are not brought up at all; they are dragged up, or left to get along as best they can. It is a common thing for mothers while away at work to lock their children in; sometimes they are left to run about as they like without anyone to look after them.

Although the continuous physical strain of work in a factory is injurious to child-bearing, the mother in her desire to go on earning to the last possible moment does not leave work a sufficient time before her confinement. This often results in premature births and the stunted growth of the offspring, and more fatal even than this is her early return to the factory, which means that the infant, at the most critical time of its life, does not get that attention which is absolutely necessary to its wellbeing.

How women's labor may supplant that of men is seen "in an aggravated form at Leicester, and, perhaps, at its worst at Dundee. In the boot and shoe factories in the former town successive changes in the processes of manufacture have thrown men out of employment because their places are taken by women and young persons, and this also drives a number of married women to seek work in the factories, since they have to try and earn wages instead of their husbands." (Evidence before Poor Law Commission, 1909, Q. 96,610, par. 4 [iii].) At Dundee there is "plenty of female employment, which results either in loafers living upon their wives or decent men being kept there who had far better go elsewhere." (Report on Effects of Employment, etc., in Scotland, by Rev. J. Pringle, pp. 27, 106.)*

Even in some branches of the engineering trade women are now finding employment. In the Westinghouse and other large works round Manchester, women, both married and single, have been introduced in large numbers to tend the light drilling machines at which the Trade Unions used to find employment for men getting on in years and unable to take heavy work. In Stoke-upon-Trent women and girls are very largely employed in the pottery industry. "In some branches of this trade they are being employed to an increasing extent upon work which, a few years ago, was performed almost

* See generally "The Wife and Mother as Breadwinner," Minority Report of Poor Law Commission, 1909, p. 1164.

exclusively by men; they are now actively in competition with male labor, and, as they are able to do similar work for lower wages, they are gradually driving men from certain sections of the trade."

But there are some instances in which women's labor has been superseded by complicated machines tended by men. The folding of newspapers, which used to be all handwork done by women, is now done by machines managed by men.

It would seem that when routine manual labor is displaced by simple machines the tendency is for women to be employed to mind them; but where complicated machinery is installed it is necessary to engage men to look after it.

Besides this sapping of the nation's life through the impaired vitality and efficiency of the mother, the evolution of highly specialized machinery has produced another very grave evil, the misuse of boy labor. Boy labor being cheaper than adult, work has been sub-divided and arranged, with the increasing aid of machinery, so that it can be done by boys; and "there is a constant tendency for certain industrial functions to be transferred from men to boys, especially when changes in the processes of manufacture or in the organization of industry are taking place rapidly. The result is the over employment of boys and the under employment of men. (Evidence before Poor Law Commission, 1909, Q. 96,921, pars. 1 and 2.) This kind of labor is uneducative (in the sense of producing no increase of efficiency or of intelligence) and unpromising (inasmuch as it leads to no permanent occupation during adult life), and at the age of seventeen or eighteen the boys are turned adrift. A few of them become skilled workmen or laborers in other trades, a few enter the army, but the majority are destined to swell the ranks of the under employed or unemployable.*

An enquiry was made in 1908 by the staff of lady inspectors into the main features of employment of children in carding of hooks, eyes, and buttons in Birmingham. It could not be completed owing to the transference of the inspectors to the north-western division. Enough was done in the way of investigation to show that children of from seven to thirteen years of age are employed to a very considerable extent, often at late hours by artificial and insufficient light straining to the eyes, in this monotonous and tiring work in their own homes; that the work is largely dependent on child labor, and is so poorly paid that "with the assistance of several persons it is scarcely possible to earn a penny an hour," being a last resource of poverty where there are children to help. The employment cannot at present be regulated, as it is excluded from the scope of the Factory Act by Section 114 and from the Children's Employment Act, the parent being the employer. Sometimes the work was found to be supplementary to Poor Law relief. Further enquiry seems to be needed, and can be undertaken when the staff is completed for the Birmingham division. In connection with the enquiry mentioned above, Miss Squire (one of the lady inspectors) visited a considerable number of houses in Birmingham in which the work was carried on.

* See generally "The Misuses of Boy Labor," Minority Report of Poor Law Commission, 1909, p. 1165; "Report on the Subject of Boy Labor," by Cyril Jackson, 1908.

She found these outworkers grouped in the neighborhood of the factories, and remarks that the hooks and eyes are found in the poorest streets and the buttons in streets of a less miserable type. The sanitary condition of many of the courts and streets of the worst was "lamentable, and the conditions as to floors, walls, and furniture of many of the homes appalling." (Annual Report of Chief Inspector of Factories and Workshops, 1908.)

It is thus clear that machinery in the hands of the capitalist, by the very fact that it gives him a greater power of production, results, under our chaotic system, or rather want of system, in over production and dislocation of industry and employment ; a state of things which, with ever greater powers of production, is increasingly likely to occur, for although improvements in machinery may not lessen the total aggregate of labor, the haphazard irregularity of its introduction and use is undoubtedly one of the chief factors in producing unemployment.*

Most, if not all, of the evils which have followed on the introduction of machinery can be traced to its exploitation by irresponsible persons for their private ends.

The recognition of this fact, shown by the passing of the Factory Acts in the teeth of individualistic opposition, needs but to be extended to its conclusion to make machinery the servant and not the master of society.

II.—MACHINERY AS A SOCIAL SERVANT.

Since, generally, machinery is only introduced into industry when it is cheaper than hand labor, it follows that successful agitation for higher wages must often result merely in the place of the agitator being taken by a relatively unskilled machine tender at a lower wage.

The employer finds no great difficulty in obtaining such machinery and cheap labor. "The number of known or discoverable inventions for saving labor which is waiting for a rise in the wages of the labor they might supersede, in order to become economically available, may be considered infinite."

Though considerable skill may be required to supervise some complicated machinery, so numerous are the intermediate types that a mere boy, who begins by minding the simplest drill or automatic lathe, may progress through practice into a qualified fitter.

Thus even such benefits as do accrue to the worker in organized factory trades through co-operation and maintenance of a standard rate, are in danger of being frustrated by agitations for still higher wages.

* No doubt, as a matter of theory, it is possible that the introduction of machinery or the equivalent industrial change might result in the production, not of more commodities, but of the same amount of commodities for much less labor ; but, as a matter of fact, in almost all cases it has been found that there has been a larger volume of trade by reducing the cost of production.

See the evidence of Mr. Sidney Webb before the Royal Commission on the Poor Laws, 1909, Vol. IX. 93,251, 93,325-93,328, et seq.

The possibilities of machinery are almost limitless. In the making of steel rails, for example, from the moment the ore is pitched into the furnace until the rail is finished, everything is done by machinery. The ingots are gripped from furnaces, laid on rollers, carried along to be pressed, and rolled out with steel fingers automatically putting them into position, entirely without human intervention.

It is in such highly elaborated industries that many of the strongest trusts spring up.

The average employee of great skill in some narrow routine of machine tending is, on the whole, less competent than any other worker to transfer his labor power to an entirely different occupation. The Steel Trust, writes Mr. J. A. Hobson, "is the owner of its employees nearly to the same extent as it is the owner of its mills and plant, so subservient has modern labor become to the machinery under which it works. Once the trust has fairly established itself, it begins to regulate production, and may suddenly close half the mills, works, or elevators. The owners of those closed plants get their interest from the trust just as if they were working, but the labor of those works suddenly, and without any compensation for disturbance, is "saved," that is to say, the employees are deprived of the services of the only kind of plant and material to which their skilled efforts are applicable." ("Evolution of Modern Capitalism," Hobson, p. 222.) In all this the growing inadequacy of tentative regulation and sectional trades unionism to cope with the increasing power of gigantic monopolist corporations is becoming more and more evident.

The only practical solution lies in increasing collective action. Society must own and control machinery, or machinery (and the plutocrat) will own and control society.

For what Purposes Machinery should be Invented.

There is little difficulty in determining what are the basic needs of society to-day. Adequate housing, good clothes, sufficient heating and wholesome food are alike lacking to the majority. To explain that all these minimum necessities of a decent existence are withheld from the masses of the community through want of purchasing power is beyond the scope of this Tract; these matters have been dealt with very fully in Fabian Tracts of a more immediately economic character.

The vesting of large capital resources in the hands of the State and municipalities will endow them with the power to obtain the services of those inventors whose talents are now prostituted in devising mere labor saving appliances. The inventor must become a national servant and the devising and satisfaction of national needs a recognized branch of State activity.

For example, the application of electricity to communal needs, to power and transit, is but in its infancy. Such a new motive force, if distributed to factories and railways on a large scale through the medium of great power stations, with a view to furthering industrial development and not to dividend making, would do more to dispel trade depression than any mere tinkering at tariffs. And this is only

possible to the State which, with its command of capital, can afford to wait for that far greater return which would result eventually from the general re-stimulation of industry.*

The consumer also benefits immensely from large supplies of power for heating, lighting and cooking provided by his municipality at a reasonable price. And the experience of many boroughs who have furthered electrical development within their area has proved so greatly are the benefits of electricity appreciated, that even under the existing restrictions of area and regulation, the municipal service can be efficiently conducted with positive advantage to the ratepayers.

All this, however, calls for new devices and new invention. The inevitable growth of collective industrial activity will probably necessitate the institution of a College of Invention, to be established, perhaps, in connection with the existing Patent Office, where skilled experts will be engaged to assist inventors in their researches, and laboratories and plant for experimental purposes will be provided.

This suggestion is not as chimerical as might at first appear. Already many large trusts, and nations in their naval and military capacities, employ permanent staffs of research workers, and it only needs that this principle should be extended to guarantee an efficient satisfaction of communal needs and to produce a considerable advance in the material condition of the people.†

When and Where Machinery ought to be Employed.

The effect of the general introduction of electric motive force in strengthening the economic position of this country in competitive international trade can hardly be exaggerated.

History shows us how the iron industry, which in 1740 was "dwindling into insignificance and contempt," was increased a hundredfold by the introduction of steam power. In all metal manufacture it was the new motor which rendered necessary improved machinery. "The immediate result of this requirement was the bringing to the front a number of remarkable men, from Brindley to Nasmyth, to supply mechanism of a proportionate capacity and nicety for the new motive power to act upon." ("Evolution of Modern Capitalism," Hobson, p. 88.) And, therefore, it may safely be concluded that any great development of electric power will also have its effect in enormously extending that routine work which can suitably be performed by machinery.

There is another class of machinery which, since its exploitation would be of no pecuniary advantage to the capitalist but merely of great social value, is so far almost entirely undeveloped, and that is all the various kinds which might be utilized to take the place of

* See "Public Control of Electric Power and Transit," Fabian Tract No. 119.

† The institution of State experimental and testing stations for agriculture is fully dealt with in Fabian Tract No. 115. The National Physical Laboratory at Bushey is another instance; in particular the new special department of aeronautics there, to which problems of aerial navigation are to be submitted by the army and navy for investigation and assistance, is an example of the principle in operation.

human labor employed upon the necessary but more degrading work of society.*

This is an almost entirely unexplored avenue of invention, and will remain so while the inventor has no inducement to turn his attention to the solution of such problems.

To find out what can be done in this direction one has but to explore a modern battleship and see how most of the more physical and unintelligent labor in serving the guns is now done mechanically, leaving to the human agent the more "spiritual" work of training and firing.

Hydraulic or electric ammunition hoists are not employed with any idea of relieving the sailor of the less intellectual forms of labor, but merely for the sake of greater efficiency; but the very fact that they are used shows that other machines might be employed in the same way as substitutes for other forms of what is merely brute labor. And not only the ammunition hoist, but the evolution, from the three decker, of the battleship itself, is but an instance of what can be done to meet a social need, if society is only allowed to express and satisfy such needs.

On the other hand, with increased collective ownership and control, the restitution of leisure and opportunity to the workers must tend to enlarge that quasi-artistic field of production in which machinery cannot appropriately be employed. Such personal things as domestic crockery, fabrics of all kinds, ornaments, furniture, etc., which were formerly produced by craftsmen, will, as a better state of living leads to a more cultured demand, tend to pass once more into the hands of the art worker.

The necessity for regularizing production which has concentrated capital in the hands of the trust must find its logical consequence in collective ownership.

There exists in America to-day a system of regulating the introduction of invention by the simple expedient of buying up possible competitive devices; and as it is the unregulated, spasmodic introduction of new processes which convulses the labor market, it is reasonable to hope that the statesmen of the future may in a similar way find it possible to regulate the introduction of new machinery.

A greater regularity of employment, the performance of an increasing amount of onerous and degrading routine work by mechanical devices, the stimulation of international trade, are results which may be expected to follow on the collectivization of machinery.

The Conditions under which Machinists should Labor.

Under no conditions whatever should labor which produces preventable accident and death be tolerated. Factory inspection, at present utterly inadequate and inefficient, must be strengthened so as to bring every workshop under direct and continuous Government control. The Factory Acts demand wide extension, and all

* See Mr. H. W. Macrosty in *Economic Journal*, March, 1909, p. 6. A manufacturer was asked why he did not introduce certain mechanical devices which would have replaced some very toilsome forms of hand labor. He replied, "Why should I? . . . it will not reduce my cost nor increase my output. . . . So long as I can get the same results with the cheap labor I now employ, why should I change?"

those industries which inevitably cause "occupation diseases" must be either carried on by mechanical or innocuous manual methods, or abandoned altogether.

The acquiescence in habitual lead poisoning, mercurial, phosphorus, and arsenic poisoning, and anthrax is neither more nor less than national murder.*

Among many other urgent problems awaiting the attention of our "National College of Invention" there is none more important than the devising of appliances to terminate this national iniquity, which sacrifices annually so many lives. Even now, with our existing Factory Acts, the internal condition of the workshop leaves much to be desired. To the thousands of deaths caused by accidents and diseases of occupation must be added hundreds of thousands of cases of direct injury to health arising from work in unhealthy factories and workshops.

For the first time since the "Industrial Revolution," machinery must be devised with some reference to the physical and nervous system of its operator.

With the better organization of labor and stimulation of enterprise, the objection to automatic stokers, feeders, carriers, and endless bands, all of which reduce the total amount of unskilled labor, will be removed.

The spectacle of an electric power station where coal is reduced to gas, passed into an engine, and its energy transferred through a dynamo into the mains, under the supervision of only three persons, will no longer be suggestive of unemployment; but every new invention for saving labor will be hailed with joy as a release from toil and a gift of more time in which to do individual work.

* The figures for 1903 are as follows: killed or died from industrial poisoning (lead, mercury, phosphorus, arsenic poisoning, or anthrax), 70; injured or suffered from industrial poisoning, 875.

For 1907: killed or died from industrial poisoning, 40; injured or suffered from disease, 653.

For 1908: killed or died from industrial poisoning, 40; injured or suffered from disease, 727.

See also Mr. Ward's Paper on Industrial Occupations, read to the Royal Statistical Society, May 16th, 1905.

Dr. Legge (Medical Factory Inspector) has supplied tables showing the number of reported cases of lead poisoning for the years 1899 to 1908 inclusive, particulars of fatal cases of plumbism for 1908, and a detailed analysis of the reports by certifying surgeons on cases in 18 groups of industries according to severity, frequency of attack, and main symptoms. The figures are somewhat higher than they were in 1907, the greatest increase being noted in connection with the smelting of metals, where the cases have risen from 28 to 70. Referring to the increase in the number of poisoning cases noted above, he thinks it is perhaps indirectly due to the inclusion of lead poisoning in the third schedule of the Workmen's Compensation Act, 1906, in two ways—(1) by causing the prevalence of pre-existing plumbism to come to light; (2) by the tendency this has fostered in these trades to replace men suspected of lead impregnation by new hands, amongst whom the incidence of lead poisoning is greater than amongst old workers. Miss Vines has investigated a large number of cases of poisoning amongst women workers in potteries. She describes the bad effects of this poisoning, quoting details of many of the cases met with, and showing how little compensation does to mitigate the sufferings caused by it. She draws attention also to the hard position of lead workers who, although not suffering from lead poisoning, are suspended from working in a lead process as a precautionary measure, and who therefore get no compensation and frequently cannot obtain other work.

So long ago as 1896 the Fabian Society presented the following resolutions on factory legislation to the International Socialist Workers and Trade Union Congress, most of which have still to be put into effect :

Considering—

That it is one of the chief duties of the State to secure the health and safety of the workers, but that this duty cannot be effectually fulfilled unless it is undertaken in a scientific manner.

The Congress demands—

1. That every Government shall institute committees of experts (including machine workers) to study the best means of preventing accidents from the different kinds of machinery.

2. That every Government shall also establish laboratories for the investigation of the safest processes of manufacture.

3. That, supported by the opinion of his expert advisers, the Minister responsible for labor shall have power to issue departmental regulations in such matters as the fencing of machinery, precautions to be taken in manufacture, etc., and also, subject to revision of his orders by the Legislature, to prohibit processes as dangerous.

4. That the white lead industry and the making of matches from yellow phosphorus—dangerous occupations for which safe and effectual substitutes are acknowledged to exist—shall be at once prohibited.

The extent to which these resolutions have been acted upon is indicated by the following Home Office Orders.

Regulations were issued in 1898 concerning the manufacture of earthenware and china, the dusting of china for transfers, and the glazing of bricks with lead.

In 1899 concerning the sorting and carding of wool and goat hair.

In 1904 concerning the loading and moving of goods in docks, and, in 1907, the spinning of hemp and jute.

Besides these, the Alkali Works Act, 1906, imposes regulations on certain chemical works from which noxious gases may be emitted, and the White Phosphorus Matches Prohibition Act prevents the manufacture, sale, or importation of matches tipped with white phosphorus.

During 1908 new regulations were made for dealing with dangerous trades, in which brasscasting and vitreous enamelling are included. As to brass, the Midland Division is the one that will be most affected by the introduction of the new regulations in place of the old special rules, and steps are being taken to secure compliance when they come into force on January 1, 1910. Efficient means for the removal of fumes from the casting shop is one of the most important of the new requirements, and Mr. Redgrave reports that considerable structural alterations will be necessary. Very few works in the Walsall district will be able to comply with the standards required for the exemption allowed to casting shops with 2,500 cubic feet of space for each worker. Regret is expressed at the way the special rules are observed in the Staffordshire Potteries. The owners show too great a tendency to delegate responsibility to the foremen, while the workers themselves are indifferent. In the same period ten sample suspected materials were referred to the Government Laboratory for determination as dangerous or safe. Electricity and Indian wool were also regulated by order.

With regard to the prevention of accidents, the railway men succeeded in obtaining a Royal Commission which sat in 1899 to consider the question of accidents. The unanimous verdict of the Commission was "that lives are lost which might be saved and men are injured unnecessarily." As a result, the Railway Accidents Act of 1900 was passed.*

CONCLUSION.

The path of immediate practical reform lies in the direction indicated by the above resolutions. The limitation of hours, the restriction of juvenile and dangerous labor, alike tend to protect the worker as producer; but the provision of steady employment and the interests of the worker as consumer have still to be considered.

If it is evident that the existence of a class of unemployed, willing, but unable to find work, is the necessary result of the present industrial system, in which every improvement in machinery throws people at any rate temporarily out of employment by rendering their labor superfluous, it follows that only by the State organization of labor, by regulating the introduction of machinery, by increasing the purchasing power of the people, and by absorbing a large portion of the surplus product for the general collective good, can employment be finally regularized.

This, too, will strengthen the worker's power as consumer.

The concentration of enormous purchasing power in the hands of a few persons, most of whom have done nothing to justify their position, results in the workers wasting their brains and bodies to satisfy the whims of the idlers.

The motor car, if put to work where it was most wanted, might have meant the revival of agriculture in England, and been an incalculable stimulus to social intercourse and recreation. As controlled by the irresponsible demand of wealthy individuals, it began merely as one more luxury for the rich (its least important function); and it is still only the overflow of this supply which reaches the organic part of the nation.

Machinery is but a part, though an immensely important part, of our social life; and until the community realizes its responsibility to itself and takes steps to gain control over its own destiny by owning and controlling the materials which give it existence, it is unlikely that machinery or any other national asset will be employed otherwise than by the powerful few to extort profits out of the necessities of the many.

THE CASE FOR SCHOOL NURSERIES.

School Attendance of Children under Five.

TILL quite recently it has been the practice in England and Wales for children between three and five to attend school if their parents so desired and for school authorities to make regular provision for such children. "During the fifteen years previous to 1907 at least a third of all such children were on the registers of public elementary schools."* Soon after the passing of the Education Act, 1902, however, the question as to whether school attendance for very young children was desirable began to be much discussed. It was pointed out that the compulsory age limit was lower in England than in any other country, and that the methods employed in most of our infant schools were unsuited to the needs of such very young children. Enquiries were set on foot by some of the new education authorities and by the Board of Education, with the result that in the Code for 1905 the following clause was inserted:—

"Where the Local Education Authority have so determined in the case of any school maintained by them, children who are under five years of age may be refused admission to that school."

Accordingly no obligation rests at present on local education authorities to provide for children under five. There are in England and Wales three hundred and twenty-seven such authorities, and of these thirty-two wholly exclude children under five from their schools, one hundred and fifty-four retain all children between three and five who are sent to school, while the remaining one hundred and thirty-six take a middle course, retaining some and excluding others.†

Reasons for Excluding Children under Five from Elementary Schools.

The reasons given for this exclusion are of two kinds ; some have reference only to the ordinary infant school as it exists at present in England, others to any kind of public provision whatever. Among the former may be mentioned :—

I. THE VENTILATION DIFFICULTY.

It has been urged that under existing conditions of air space proper ventilation is almost impossible, and that the air has been actually found to be more impure in schools than in the dwellings of the poor.‡ It is argued that in the case of older children the risks

* Report of the Consultative Committee upon the School Attendance of Children below the age of Five (Board of Education, July 2nd, 1908), p. 12.

† Ibid. Appendix I. and V.

‡ Ibid. Appendix III.

from bad air are less while the advantages of education are greater, that it is a heavy and needless risk to herd very young children together in bad air. Such objectors take for granted that the present unsatisfactory conditions as to ventilation are to be looked on as inevitable, but, "it certainly seems anomalous, to say the least, that elementary schools should be allowed to remain as the classical example of bad ventilation, and that children should thus be taught by practical example to tolerate foul air."† It must be remembered, too, that the bad smell and intolerable stuffiness of the ordinary schoolroom, which are the outward and sensible sign of injurious air conditions, are due rather to dirt than to actual deficiency of air. "Far more could be done by cleanliness than by ventilation. The floors and walls should be capable of being properly cleansed, and the children themselves and their clothes kept clean and tidy."* Now in the nursery school cleanliness would always be specially insisted on, would indeed take the very first place among subjects of instruction, so that it may be hoped that the air would in them be less laden with impurities than in the ordinary elementary school. It must be noticed, too, that the children in such schools ought to spend a large part of their school time out of doors, and that no day nursery or nursery school is complete without ample playgrounds, both roofed and open, with facilities for resting out of doors in good weather.

2. THE DANGER OF INFECTION.

"In proportion to the number of children, the spread of infectious diseases caused by school attendance is greater before five than after; but it must be remembered that if more escape *before* five, the greater will be the incidence of the disease *after* five."* It is also noteworthy that "with the better training of teachers on the hygienic side and the appointment of school medical officers, a state of things will arise, and, in fact, is arising, in which attendance at school will become a means of decreasing the diseases (more especially diphtheria and scarlet fever)."+

3. THE DANGER OF PREMATURE MENTAL STRAIN.

"The question of overpressure has been rather exaggerated. Practically it does not exist in infants' schools, except in the case of children with defects to start with, children highly nervous or badly nourished, for whom the work is too much. At the same time, much of the instruction now given is without doubt unsuitable. . . . Play is the best way of educating young children; let them follow their natural instincts as in the nursery. . . . Above all, avoid any idea of enforcing discipline. Fine muscular movements (as of the eye or fingers in reading, writing, or sewing, etc.) should be post-

* Ibid. Appendix III. Memorandum by Dr. Haldane on the air in schools.

† Ibid. Evidence of Dr. James Niven, Medical Officer of Health, Manchester, pp. 80 and 81. Dr. Niven has since furnished statistics showing that over a period of five years in Manchester the case mortality was substantially the same amongst children attending and those not attending school.

poned until the child has obtained a fuller control over its muscles. . . . Drill is very important, and should consist of 'coarse' movements as contrasted with the 'fine' movements mentioned above. Organized games can be made into a very severe lesson ; their value is much exaggerated."* This danger of overstrain through unsuitable treatment is of the utmost importance ; and it is the special claim of the nursery school to avoid it by providing just that atmosphere of freedom and kindly encouragement which a sensible mother gives to her child, avoiding alike over stimulation and needless restraint.

But, in addition to these special and more or less avoidable dangers, general objections are raised against making any public provision for little children which would facilitate their removal from home. There is, for instance :—

4. THE DANGER THAT PARENTAL RESPONSIBILITY MAY BE WEAKENED.

Experience has shown over and over again that the parental burden is too heavy. All observers agree that children attending school are better looked after by their parents, kept cleaner and tidier, than they would be if they stayed at home. A marked difference may be noticed in almost any poor district in the appearance of the children on Saturdays and during the holidays. It would be much nearer the truth to say that any arrangement which involves the child's being periodically submitted to outside inspection would raise the standard of parental responsibility, and that this influence would be greatly increased by teaching and illustrating what the needs of young children really are. The hollowness of this objection is apparent when one considers that the wealthy ladies who think it so dangerous to relieve the hardworked mother of any of her duties to her little ones find it necessary to depute all such duties in their own case to a nurse. This fact furnishes an answer also to another objection which is often urged, viz., that little children require such constant individual and loving attention that they are better looked after by their mothers than by anyone else. Let us look at the facts. How does the rich mother who has free choice in the matter act ? Does she keep her three year old child constantly with her when she is reading, writing, talking to her friends, or eating her meals ? No ; she devotes, perhaps, a few hours in the day to it when she can give it a fair share of attention, and for the rest of the time she places it with a skilled attendant either out of doors or in an airy, sunny apartment, where it can play about freely under due supervision. What does the poor mother do ? If she is able to remain at home, she will allow her three year old to crawl about the kitchen floor or play in the street, or, perhaps, if he be a venturesome child, will tie him to the leg of the table, so that he may not tumble into the fire, while she is busy with the dinner, the housework, or the family washing. If, on the

* Ibid. Evidence of Dr. Kerr and Dr. Hogarth, Medical Officers of the Education Department of the London County Council, pp. 63 and 64.

other hand, she has to go out to work, she will leave him with a "minder," usually some old or feeble person who is not able to do more active work, or, if she can manage to hoodwink the attendance officer, with an elder brother or sister kept at home for the purpose. Can it be seriously alleged that it would be a disadvantage to the child to be removed from the minder, or even from the home kitchen and the tail of his mother's eye, to a nursery resembling that which the rich mother provides for her own child, but shared with a number of little neighbors of its own age? It is just because little children require constant and watchful attention that collectivist nurseries are so much needed. One capable, motherly, experienced woman, with a suitable number of trained assistants, can superintend the tending and training of a large number of infants; while one woman with a house to clean, a family to feed and clothe, and the washing to do, cannot properly care for one.

5. THE DANGER OF ENCOURAGING BOTTLE FEEDING.

But though this dread of lightening the responsibilities of motherhood may for the most part be dismissed as sentimental, yet there is one aspect of it, affecting our dealing with infants of only a few months old, the importance of which cannot possibly be exaggerated. The right place for a suckled infant is with its mother, and in a well ordered State no woman would be allowed to undertake work away from home until her child was nine months old; but any legal prohibition of this kind seems, unfortunately, a long way off, since it would necessarily imply State maintenance for nursing mothers. Meanwhile, as long as husbands are liable to be underpaid or unemployed, mothers who should be nursing their babies will accept laundry work or charring; and when this happens the unfortunate baby will fare better in a crèche, where it will receive pure milk, suitably diluted, out of a clean bottle, than with the casual minder. It does not necessarily follow, however, that the crèche baby should be hand fed. After the first few months, when the feeding has become less frequent, it is quite possible for nursing mothers to visit the crèches at suitable intervals. In French and Belgian crèches a room is usually set apart for this purpose.

The Need for Public Provision for Children under School Age.

It seems clear, notwithstanding all difficulties and objections, that public provision must be made for some children under school age. Even if we decide with the Consultative Committee* that the proper place for such children is at home with their mothers, yet we are bound to admit, as they do, that the home surroundings of large numbers of children are not satisfactory, and that children from these homes should be sent during the daytime to places specially intended for their training.* No responsible person in London, for instance, is prepared to recommend that the children under five now at school should be turned into the streets.

* Ibid. P. 57.

Kind of Provision Required.

We have already said that of actual teaching, in the ordinary sense of the word, children under five ought to receive very little. Information should be given very sparingly and only in response to awakened curiosity. Restraint, compulsion, and punishment should be almost unknown ; but there is one kind of education which must take place in these early years if at all, and on which health and efficiency in after life largely depend, I mean the formation of physical habits.* People are apt to forget that breathing, walking, eating, speaking and sleeping have to be learnt, and that there are right and wrong ways of doing each. They are all difficult arts to the baby learner, and he may be much helped in acquiring them by an expert and watchful guardian. As soon as a child is born one may begin to teach him regularity and periodicity in sleeping, eating and the evacuations of the body, and by the time he is a year old he is ready for one or two new lessons. Every year a little more may be done in the way of checking injurious habits and encouraging useful ones ; and it must be remembered that these nursery lessons are not less but far more important than the reading, writing, and counting that are taught in the ordinary infant schools. If we consider what are the differences that distinguish a well-bred person from an ill-bred one, we shall find that they depend for the most part on habits acquired in babyhood, modesty, refinement, consideration for others shown in such everyday matters as eating, drinking, and moving about, accurate and distinct utterance, and little points of personal cleanliness. Training of this kind should find a place in the crèche and the nursery school, while it is almost impossible that it should be given by the overworked mother in a workman's home.

Children must be Taught :

HOW TO WASH.

Cleanliness is, perhaps, the most important aspect of the question. The wish to be clean is not born with us. It has to be taught and trained. If a child can be induced to feel uncomfortable when he is dirty, a great step has been taken towards civilizing him and towards the establishment of a higher standard in living for the next generation. This is a point that needs emphasizing, for there is no doubt that we rank lower in regard to cleanliness of clothes and person than other European countries. One's nose testifies to this fact if, after travelling in crowded workmen's trains in England, one does the same thing in France or Germany.

* " Habits, whether they be born in us or are subsequently acquired, constitute man's whole nature, and they are the results of experience or education. Our education does not begin when we commence to learn to read or write, nor does it commence when we learn to breathe or suck. It has been steadily going on ever since our first foundations were laid in the immeasurable past. The education of the infant consists in teaching it how to acquire good and useful habits which are not born in it, and which will enable it to live a complete life, and take full advantage of the opportunities of its surroundings or environment."—" Infant Education," by E. Pritchard, M.A., M.D. (Oxon.), M.R.C.P. (London).

In England the crusade for cleanliness in the schools is only just beginning. The first step was taken when nurses were appointed to examine the children's heads. Some teachers insist on clean hands and faces, but investigations have seldom proceeded further. Now that medical inspection is at length instituted, terrible disclosures are being made of verminous bodies and diseases engendered by dirt. Now cleanliness is a lesson that can be taught. Few lessons are easier to teach, provided that necessary appliances are at hand, and none bring to the pupil a more immediate and obvious blessing. None certainly are more important if the first aim of our schools is to extend to the children of the poor the opportunity of leading a decent life. But this important lesson is not one that can wait for the school age. The evil results of dirt affect the health of a young child even more than of an older one. A child of two or three years old preyed on by parasites is an object so deplorable that nothing could be more absurd than to permit children to remain in this condition till they are five years old and then expend large sums on teaching them the three R's, often without any cleansing process at all.

In any public nurseries which may be established in England the bathing apparatus would have to play a very important part, and clothing would have to be rigorously inspected and, when necessary, replaced. A time may come some day when English mothers, like French ones, may be required to provide clean underlinen twice a week for their children and a clean pocket handkerchief every day; but to anyone familiar with our schools in poor districts such a time seems remote.

HOW TO SLEEP.

The children of the poor suffer almost as much from want of sleep as from want of food.* The regular midday rest, which is such an important feature in the régime of the nursery, is a luxury of the rich, and in a two roomed household it is almost impossible to put the little ones to bed early enough at night. Undisturbed sleep at regular intervals is in itself invaluable, especially as the means of forming a periodic physical habit which will last a lifetime. Any schools for children under six should be provided with suitable and sufficient sleeping accommodation. "The babies must be allowed to sleep when they want to, and should all be trained to sleep during the day."*

HOW TO EAT.

Another very important nursery lesson is the right way to eat. Recent experience in organizing school feeding has amply proved the need for it. That we teach children to read and write before they know how to eat is an example of our topsy turvey methods. If we instructed them early in the use of their teeth, and were careful to provide suitable materials for that instruction, we should need to spend less later on in dentistry. The dinner table, too, with its code of manners, founded on consideration for others, pro-

* Report of the Consultative Committee upon the School Attendance of Children below the age of Five, pp. 90-96.

vides an admirable field for moral instruction and for laying the foundations of civilized life.

HOW TO TALK.

Second only to the importance of learning to wash, to sleep, and to eat, is that of learning to talk. Speech, the widest and most distinctively human of the arts, must begin in the nursery; and much depends on whether it begins there well or ill. Nothing is more noticeable and more distressing to the visitor in our schools than the inarticulateness of the children. One has to delve deep to reach a response. To receive an answer prompt, fearless, and distinct is so rare as to be absolutely startling. There are many reasons for this, but the most obvious is an actual difficulty in utterance. The children have never been taught to speak, and most of them make very clumsy attempts at it. Of course, they soon acquire a code of half articulate sounds, which serve to express their more urgent needs and emotions; but their ears are not trained to recognize nice distinctions of sound, and as they grow older the possibility of such discrimination is lost. The vocal organs, too, having no demands made on them, lose their flexibility and become unmanageable. Bad habits of breathing, too, pass unnoticed, which are difficult to cure and have very bad results.

To impart some familiarity with spoken language, the child should be taught to pronounce very simple words correctly and delicately; and his vocabulary should be extended gradually as his field of observation widens. This should be the chief educational aim of the nursery school. No child can think to much purpose till he can speak, or make any real use of information till he can frame his thoughts into sentences. The power of expression is absurdly neglected throughout our schools. We proceed to teach children to read while they are still, to all intents and purposes, dumb, which is like forcing food on a sick man who can't digest.

But though speech is the most important of the nursery arts, it is not the only one. Much can be done to assist that long, unwearyed, ingenious campaign which any healthy child will devise and carry on for himself, and which has for its unconscious aim the control of his own nerves and muscles.

Limit of the Nursery Period.

It is impossible to make hard and fast rules as to the dividing points in a child's life. One child will be more developed at four than another at six, and it is difficult to decide at what age the sort of training sketched above should give place to ordinary school methods. There is much to be said, however, for fixing the break at six or seven rather than at five; and in this we may, perhaps, be guided by the practice in well-to-do households, where children migrate from nursery to schoolroom at about that age. For it is well to bear in mind that what we are pleading for is, after all, a peculiarly English institution. Those very advantages, unfortunately, on which the English middle class specially pride them-

selves, they are the least eager to share with their poorer neighbors. We boast of the playing fields of Eton, and of the admirable training in self-control and esprit de corps to be gained in them, and leave our elementary schools with a wretched square of asphalt, where nothing can occur but a disorderly scramble. We are proud of our English cleanliness and our cult of the daily morning bath, and yet we are content to allow our school children to remain the most filthy and ragged in Europe. So though England is the home of the nursery (the word being untranslatable), and the wealthy mother in Russia or Italy makes a point of securing an English nurse for her children, yet a nursery for the children of labor is a notion of foreign growth, and we must turn to France, to Belgium, and to Hungary to see anything like an adequate realization of it.

In all these countries the school age is six, and provision is made for children below it in two separate institutions, the *crèche* and the *école maternelle* or *école gardienne*, as it is called in Belgium.

The following account of these institutions is compiled from reports published by the Board of Education :—

The Crèche in England and France.*

In Paris the first *crèche* was opened in 1844 by private enterprise and supported by charity. Mothers paid twopence a day per child, emphasis being laid on the intention of helping those who were obliged to earn their living, rather than merely of feeding and sheltering the children of the indigent. In 1847 the Society of *Crèches* was inaugurated at the Hotel de Ville, and in 1869 it was recognized as an institution of public utility. In 1904 Paris, with a population of two and three-quarter millions, had sixty-six *crèches* accommodating two thousand four hundred and ninety-one children under three years old. It is instructive to compare these figures with those for London, where, with a population of four and a half millions in 1904, there were fifty-five *crèches*, accommodating one thousand six hundred and ninety-three children under three. "In other words, London had *crèche* accommodation for one child in every two thousand five hundred, Paris had *crèche* accommodation for one child in every thousand. The *crèches* in London are private, with no aid from State or municipality, while those in Paris have received both since 1862. London has no registration or system of State inspection. Paris has both, the *crèches* being inspected daily by doctors. Lastly, the London *crèches* are distributed quite irregularly, some of the poorest boroughs having none at all, while Paris *crèches* are evenly distributed among twenty *arrondissements*. Even more startling are the differences outside the capitals. France, not including Paris or the Department of the Seine, has three hundred and twenty-two *crèches*. England, not including London, or greater London, has nineteen." †

* Report of Miss M. B. Syngé, published by the Board of Education in July, 1908, together with the Report of the Consultative Committee previously quoted.

† The French statistics are taken from the Report of the Chief Officer of Public Control.

English crèches, or day nurseries, are, for the most part, organized by committees of ladies. They are mostly parochial and supported entirely by voluntary contributions. Few of them are in houses built for the purpose: most are in adapted premises.* Any private person may open a crèche in England without leave from any public body; crèches are unregistered and under no inspection.

The crèche in France, though not State supported, is generously subsidized. In the year 1904 Paris crèches received from the Minister of the Interior £1,468, from the Ville de Paris £67,045, and from the Conseil General des Départements £1,376.

No crèche may be opened in Paris without leave from the prefect of the department. In order to receive a grant it must be subject to inspection, conform to certain rules, and be administered by a council presided over by the mayor of the locality.

At the head of every crèche is a directress. Under her there is a berceuse to every six children and a gardienne to every twelve children under the age of one and a half years. In a large crèche there are also a cook and a laundry maid.

Each crèche has twenty or thirty "dames patronesses" or managers under a lady president. They are appointed by the mayor. Each lady has certain days or weeks in the year allotted to her and is definitely responsible for certain duties of management.

Children are admitted at the age of fifteen days and kept till the age of three. The mother is requested to bring the child clean. While she is feeding it herself she must come regularly to the crèche at least twice a day. She must pay her contribution, two-pence for one child, threepence for two, every morning, and she must show that she is obliged to go to work or is incapable of attending to the child at home.

Illegitimate children are admitted after due investigation.

The cost per day per child at the Paris crèches averages about one shilling, so that the mother's payment covers only one-sixth of it.

The children are supplied with clothes. These are changed when they arrive and again at night.

There are usually seven or eight doctors attached to a crèche, one of whom visits it every day. In many cases these doctors, who give their services entirely free, form a committee to decide all questions connected with hygiene.

To some crèches is attached a "School for Mothers," to which infants not in the crèche are brought for weekly inspection, and tables are kept of the weight and progress of each child.†

The forty-five crèches in Paris receiving municipal grants are subject to inspection. In addition to the ordinary inspectors, a lady inspector of crèches has recently been appointed.

* A movement towards a better condition of things has been recently made by the National Society of Day Nurseries, founded in 1906 with the object of assisting local committees and affiliating existing nurseries.

† For further details consult "The Nursling" (see Bibliography, page 19), Lecture X., and translator's preface.

All the Paris crèches can be visited by anyone who is interested in them without introduction.

The Crèche in other Countries.

The chief characteristic of the Belgian crèche is that it is nearly always run in connection with an école gardienne or nursery school, which admits children up to the age of six.

The crèche system is not by any means so widely developed in Belgium as in France (outside the capital the only town at all adequately provided being Liège, which has six crèches), but in the poorer suburbs of Brussels there are one or two crèches admirably installed and managed which far surpass anything of the kind in England.

Crèches or Krippen exist in most German and Swiss towns,* and are usually separate from the kindergartens or nursery schools. The krippe admits children from six weeks to three years, and is intended only for the children of mothers who are out at work. It is open from 5.30 or 6 a.m. till the factories close in the evening, or sometimes till 8 p.m. The charge is usually about twopence a day; sometimes, to nursing mothers only, one penny a day. Illegitimate children are not excluded. Krippen are, as a rule, in the charge of Sisters (Catholic or Protestant), with voluntary helpers, who have nearly always been trained in the management of infants. The krippen are not municipally organized or supervised, but they receive in many towns municipal grants varying a good deal in amount. The cost varies from sixpence to tenpence a head.

Nursery Schools.

Between the crèche and the elementary school there is obvious need for a half-way house. This is already supplied, after a fashion, in some parts of the country by the baby class in the infant school, but nowhere in England is it sufficiently recognized that what is needed is not a school at all in the ordinary sense. Children under five (or, as I should prefer to say, under six or seven) should receive little or no definite instruction. They need plenty of freedom for spontaneous activity among wholesome surroundings under the guidance and supervision of attendants who have been trained in matters relating to health, to conduct, and to the growth of intelligence. Large rooms, well lighted, well aired, well warmed, and a pleasant open air playground where, if possible, plants and animals can be watched and tended, not too much interference, but the constant care of kind and watchful nurses; these are the requisites for a nursery school. In England, although a kindergarten here and there comes near to this ideal, no attempt has been made to supply the need for them all over the country. For anything of the kind on a national scale we must turn to France, Belgium, or Hungary.

* See Report by Miss May published with that of Consultative Committee.

THE ÉCOLE MATERNELLE (FRANCE).

Yet it is consoling to our national vanity when we look up the history of the French écoles maternelles, from which we have now so much to learn, to find that in their origin they owe a good deal to an Englishman and a Socialist.

For their first germ, indeed, we must go to Switzerland and to the year 1771, when Pastor Oberlin started his first école à tricoter in the Vosges. Mme. Pastoret transplanted the idea to Paris in 1801 when she opened a salle d'hospitalité, where the children of working mothers could be taken in and cared for; but it was not till 1826 that anything approaching the modern maternal school was opened, and by that time Mme. Pastoret had learned all she could about the infant schools which had been started by the English cotton manufacturer, Robert Owen, in 1812.

It was in the blackest hour of English child slavery that these schools appeared like a dawn of hope, an illusory dawn unfortunately. Robert Owen, roused by the pitiable condition of the poor children collected together from public charities and poor houses in order to work in the cotton mills, put a stop in his own mills to the practice of employing them from the age of six, and persuaded the parents to send them to school at two and keep them there till ten. Of these eight years the earlier were, in his opinion, even more important than the later. His reasons for thinking so are to be gathered from the very interesting evidence which he gave in 1816 before the Select Committee of the House of Commons to Enquire into the Education of the Lower Orders in the Metropolis. In describing the treatment of the infants, he says:—

They were perpetually superintended, to prevent their acquiring bad habits, to give them good ones, and to form their dispositions to mutual kindness and a sincere desire to contribute all in their power to benefit each other. . . . In fine weather the children are much out of doors that they may have the benefit of sufficient exercise in the open air. . . . The children were not to be annoyed with books, but were to be taught the uses and nature or qualities of the common things around them by familiar conversation, when the children's curiosity was excited so as to induce them to ask questions. . . . All rewards and punishments whatever, except such as nature herself has provided . . . are sedulously excluded. . . . A child who acts improperly is considered an object not of blame, but of pity. . . . No unnecessary restraint is imposed on the children. . . . The dress worn by both boys and girls is composed of strong white cotton cloth of the best quality that can be procured. It is formed in the shape of the Roman tunic, and reaches in the boys' dresses to the knees and in the girls' to the ankle. These dresses are changed three times a week that they may be kept perfectly clean and neat. The parents of the older children pay threepence a month. Nothing is paid for the infant classes. . . . The infants, besides being instructed by sensible signs—the things themselves or models or paintings—and by familiar conversation, were from two years and upwards daily taught dancing and singing.*

Owen had some difficulty in finding teachers who would adopt his views and could carry them out.

I had therefore [he says] to seek among the population for two persons who had a great love for, and unlimited patience with, infants and who were thoroughly tractable and willing unreservedly to follow my instructions. The best to my mind in

* "An Outline of the System of Education in New Lanark," published, 1824, by Robert Dale Owen (Robert Owen's son); see "Life of Robert Owen," by F. Podmore (London: 1906).

these respects that I could find in the population of the village was a poor simple hearted weaver, named James Buchanan, who had been previously trained by his wife to perfect submission to her will, and who could gain but a scanty living by his now oppressed trade of weaving common plain cotton goods by hand. But he *loved* children strongly by nature, and his patience with them was inexhaustible.

This man was afterwards sent to London to superintend the first English infant school, which was opened in Westminster under the patronage of James Mill and other distinguished men. Owen gives an amusing account of his disappointment on the occasion of a surprise visit to this school :—

On entering the school, the first object that I saw was Mrs. Buchanan, whom I had never seen in the New Lanark school, brandishing a whip and terrifying the children with it. Buchanan I saw in another part of the room without authority or influence, and as much subject to his wife as the children.

Owen was full of ideas, and none of them were more original and valuable than those as to the education of infants ; but, as one may judge from the above extract, he does not seem to have had the knack of gathering round him the people who could satisfactorily carry out those ideas and render permanent the institutions which sprang from his warm heart and fertile brain. But England was deep in the trough of *laissez faire*, and one need not wonder that here Owen's preaching fell on deaf ears and produced no permanent results.

France, quickened by a stirring of revolt and intellectual awakening, offered more hopeful soil ; and there, as we have seen, the seed germinated when the first *salle d'asile* (or *salle d'essai*, as it was at first called) was opened in the Rue du Bac in 1826. Seven years later the *salles d'asiles* received their first recognition by the State, and in 1837 a commission was appointed to draw up rules for their conduct. These rules were revised from time to time, and a special training school for infant teachers was opened ; and at last, in 1881, the old name of *salles d'asiles* was changed to *écoles maternelles*, and the rules as to admission and the program were settled and codified.

At the head of every *école maternelle* is a directress, a certificated teacher, whose salary, paid in part by the State, in part by the commune, begins at one hundred and sixty-eight pounds a year, and rises gradually to a maximum of two hundred and eight pounds, with a right to a pension at the end of twenty-five years. She is helped by a number of assistants (one for every forty children), whose salaries begin at eighty-eight pounds, and rise to one hundred and twenty-eight pounds. There are, in addition, a number of nurses or servants chosen by the directrice and paid by the commune, whose wages vary from forty pounds to fifty pounds.

The directress has various registers to keep, which must be at the disposal of the inspectors.

On the arrival of the children in the morning, she must ascertain by personal inspection that each one is in good health and clean. She also inspects their baskets, and sees that each child has brought a pocket handkerchief. She receives the pence and keeps a list of those who are fed free of charge, and she supervizes the school canteen.

The assistants must be over seventeen and certificated. Each has a separate class, and a great deal depends on the ingenuity and child love of the teacher. They help with the midday meal if required. The school hours being very long, they take it in turns to stay overtime.

The nurses, or *femmes de service*, are a most important addition to the staff. There is one, at least, in every school; two, if the numbers justify it. Their duties are very various. They sweep out the school every day, and open it at eight in winter and seven in summer for any children whose mothers go early to work, taking charge of the children till the directress and assistants arrive at nine o'clock. The *femme de service* superintends the children at the water closets every morning and again at one o'clock. This, from a hygienic point of view, is most important and is much neglected in English infant schools. She also washes the children's hands and faces twice a day and, in some schools, gives them a weekly bath and helps to wait on them at the school dinner. As in the case of the *crèche*, the general superintendence of the school is in the hands of a committee of ladies presided over by the mayor. Members of this committee visit the homes of the children.

The *école maternelle* is optional and free. Children between the ages of two and six are admitted on producing a note of admission from the mayor of the commune. Mothers are specially asked to bring the children clean and to pack in their school bucket a spoon, a dinner napkin, some bread and wholesome drink.

The schools are entirely paid for out of public funds, the cost being divided between the State, the department, and the commune.

The "*Caisses des Ecoles*" is a benevolent society subsidized and controlled by the State. It originated in 1840 and has grown into an organization of great importance. It covers much the same ground as our newly established Care Committees, its object being to provide clothing, boots, and food to necessitous children. It also provides for country holidays and vacation schools.

About a third of the children in the *écoles maternelles* pay for their food and the rest have it free. The list of the latter is kept by the mayor. The food consists chiefly of milk, vegetable purées and other soups, maccaroni, semolina, and tapioca, with very little or no meat.

Many of the large towns in France are spending great sums in feeding the children in the *écoles maternelles*. Marseilles has made all the feeding in them free. St. Etienne charges three halfpence, for which wine is given.

The *écoles maternelles*, like the other French schools, are inspected at least twice a month by the medical inspector; but besides these there is a large staff of special lady inspectors.

With regard to medical inspection of Paris schools, it must be remembered that in every district there is, under the *caisse des écoles*, a free dispensary for children subsidized by the municipality. Here children from the schools can have baths, hair cut and washed,

medical advice with regard to teeth, eyes, ears, etc.; while a free distribution of cod liver oil is made to necessitous children in the winter.

It is difficult to give any idea of the school program in a few words. It includes games, manual work, such as building with bricks or cards and making artificial flowers, the first principles of moral education, knowledge of everyday things, drawing, and lessons on language. Reading is taught to children over five, but not much insisted on. The little talks on familiar subjects are, perhaps, what strike one most. Take this, for instance: "The house, the kitchen. Let the child describe it. What can we see? Kitchen fire, table, etc. The use of each object. What does mother do? Each child? Cat? Children should help their parents without complaining." Or this: "The pocket handkerchief. What is it? What is its use? Blowing your nose, spitting. Each must have a handkerchief. How to use it. Unfold, refold."

Simple, familiar topics, such as these, afford the best opportunities for inducing children to talk; and nothing is more important in dealing with the little ones from neglected homes.

The Ecole Maternelle in Other Countries.

France does not stand alone with regard to nursery schools. In Belgium an *école gardienne*, as it is called, is attached to every *crèche*, and is managed on much the same lines as the *écoles maternelles*.

Germany, Switzerland, Portugal and Hungary all have their maternal schools or kindergartens.

In Hungary* they are excellent. Early in the nineteenth century, a Countess of Brunswick, having been much impressed by the infant schools of Owen's follower, Wilderspin, in England, came back to Hungary, and urged the claims of infant education just at the moment when reform was rife there.

A normal school for training infant teachers was founded so early as 1837, and in 1875 kindergartens were recognized by the State as a definite form of public instruction.

By an Act of Parliament, passed in 1891, attendance at a kindergarten is compulsory for all children between the third and sixth years. These schools were dominated at first by the German idea, but by 1899, when Miss Catherine Dodd visited the country, the language, songs, and games used in them were markedly national in character, showing the influence of Hungarian life and history. One game, for instance, represented the shepherds taking care of their herds on the plains, and guarding them from the wolves which came down from the mountains; while another showed traces of the Hungarian struggles with the Turks. Weary soldiers march to fight the Turks. The village rouses into activity; the baker, the winepresser, the housewife, the tailor, and the shoemaker, all set to work to feed, clothe, and house the soldiers.

* Report on Hungarian Education, Special Reports, Vol. 8, p. 498.

"I visited a village kindergarten this year [she writes]. The village lay among vineyards in a celebrated wine district on the Danube. In front of the building was a large canvas tent covering a great patch of sand, and here, sheltered from the sun, were fifty bare legged mites playing. They played games which were characteristic of the district. There was a wind game, and the children imitated the wind which blew the boats along the Danube. There was a game of making wine casks. Groups of children formed the cask, and the other children walked round, hammering in imaginary nails; while other children cut down imaginary trees to make the casks. There were one hundred and fifty children in this kindergarten. They were all in charge of one qualified teacher and her little maid servant. Everybody admitted that the staff was small, but they urged that it was a poor district. The town kindergartens are well staffed and fitted up with all necessary apparatus.

"I found a class of five year old children, sitting on benches out of doors under the acacia trees, building with Gift III. They smiled at us and cried out, 'Tzen hozta' ('God has brought you'); and they showed the bridges to cross the Danube, the wells to get water on the plains, the mills to grind corn, which they had built.

"All kindergarten teachers play the violin. In the games and songs the teacher is leader. She marches first, playing her violin, and the children follow, singing. . . . I spent a day in a kindergarten training school during the examinations. In the garden we found some twenty girls, with their violins, practising the national songs of Hungary. They marched round the garden, singing and playing in chorus, until they were called in to meet the examiner.

"All kindergartens in Hungary must have open playing places shaded with trees. Children under three may be admitted, but, as the regulation quaintly states, not in swaddling clothes."

Though Hungary is the only country where the attendance of children under five is compulsory, yet we have seen that in all, except England there is some recognition of State responsibility with regard to children below school age; and it is clear that something must be done in this direction before long. It is, therefore, most important that the question should be thoroughly ventilated.

The proposal made in the Minority Poor Law Report that the entire supervision of maternity and infancy, and the administration of whatever public provision is made for these services should be in the hands of the local health authority has, of course, a very important bearing on it. This proposal would, if fully carried out, remove entirely from the domain of the education authority any public day nurseries or nursery schools which may be decided on. The common sense view seems to be that throughout the life of the child its interests should be guarded both by the education authority and the health authority; but that the province of the latter, which would at first cover the whole field, would become gradually more restricted. At the stage when health considerations are predominant, the local health authority must undertake the administration, making use of the teachers of the education authority as required; at the stage when educational considerations are predominant, the administration must be in the hands of the education authority, making use of the doctors of the health authority as required. In the crèche there should be, as in France, daily medical inspection, and the management should be chiefly in the hands of doctors; but even here questions for the educational expert will arise with reference to the qualification of the staff and the training of the older infants. In the nursery school, the medical inspection required will be almost as frequent, but the educational point of view will need to be rather more adequately represented in the committee of management.

How this joint action of the local health authority and the local education authority can best be attained, at all stages of the child's life, is a question of administration with which we need not meddle here,* but it seems desirable that there should be no sudden break at any age. The establishment of public crèches, under the direct control of the local health authority, would be an invaluable supplement to the system of combining the work of health visitors, either paid or unpaid, with that of the medical officer of health and his staff. This system, already successfully established in many parts of London, aims at keeping under observation every infant from the time of its birth by means of friendly visits of advice. As things are at present, a health visitor is often harrowed by the hopeless conditions into which a baby is born, and feels that her advice is little better than a mockery. Mothers are often quite unable, either from poor health or from the dire necessity of bread winning, to nurse their babies or attend to their constant needs; but there are worse cases still where, from sheer lack of any alternative, a new born infant must be left to the tender mercies of a drunken or dissolute mother, whose one precaution is to insure its life.

In cases of this kind, a public crèche, to which the medical officer of health had power to order the removal of any neglected infant, would be a great resource. Such enforced removal would never happen, of course, in the case of any decent home or of any mother who was nursing her child; but as an alternative for the casual minder, the feeble grandmother, or the ten year old sister, it would be invaluable.

The question of payment would have to be settled as in the case of school feeding, after inquiry into the family resources, and need not in any way interfere with the decision of the medical officer. The cases that would come before him may be classified as:—

1. Temporary.

Homes even of the best type are liable to be disorganized from time to time by the disablement of the mother or father, or by some other unavoidable misfortune; and the temporary removal of young children to a safe refuge affords invaluable help towards tiding over such a period, while it saves them from the evil consequences of neglect.

2. Wage Earning Mothers.

During the first three or four months of an infant's life, the mother might well be restrained by law from going out to work, home aliment being provided in necessitous cases; but as the child grows older, some mothers will certainly desire to return to their work, and provided that they are not in receipt of public assistance for the children, conditional on their devoting themselves to the care of the children, there seems no adequate reason why they should not do so.

* Cf. *Minority Poor Law Report* (Official Edition), Note on p. 1224.

3. Homes that have been or ought to be Broken Up.

The widower or deserted husband has no choice at present but to pay a neighbor to look after his children, a service often most unsatisfactorily performed ; but there are cases even more piteous. Bad health, bad habits, or merely unemployment on the part of the father, slatternly incompetence, or something worse, on the part of the mother, bring about a gradual and hopeless deterioration of the household which renders it unfit for little children to live in. Under such circumstances, it is essential that the medical authority should have power to order their removal to a public nursery, where they will be entirely under the parental control of the State.*

Reforms to Work for.

1. That the age for compulsory school attendance be raised to six, with a corresponding addition at the other end, making the compulsory period from six to at least fifteen or even older.

2. That the medical officer have power to enforce the attendance at a suitable nursery school of any child under six who is not suitably cared for at home.

3. That every local authority be required to provide adequately for children from three to six in free nursery schools, with sleeping accommodation and ample open air and covered playgrounds, and no teaching of the three R's.

4. That at such schools suitable meals be provided at the expense of the rates, table manners being an integral part of the curriculum.

5. That every local authority be also required to provide boarding schools in the country to serve as convalescent and holiday homes for the children attending nursery schools who are found by the medical officer to need country air, and also for the reception of children removed from their parents by the order of the medical authority.

6. That sufficient accommodation be provided in every district for infants under three in small day nurseries under the control of the local authority, such nurseries to be entirely free.

7. That the feeding of the children at these day nurseries be under direct medical supervision, mothers being encouraged to attend regularly for the purpose of suckling their infants.

8. That in connection with every such nursery there shall be a "school for mothers," or "consultation for nurslings," where babies may be brought by their mothers for free medical inspection and advice, and where pure and suitable milk will be provided free or at cost price.

SOCIALISM AND SUPERIOR BRAINS.

PREFATORY NOTE.

IN January, 1909, Mr. Keir Hardie delivered an address in which he pointed out that the remarkable increase in our national income, of which so much was being said in the controversy then raging between Free Traders and Tariff Reformers, had not been shared by the working classes, who were no better off than before. Immediately Mr. W. H. Mallock wrote to *The Times* accusing Mr. Keir Hardie of ignorance of political economy, on the ground that an educated man would have known that as the increase had been produced by the exceptional ability of the employers and inventors, there was no reason to claim any share of it for the employee class. Thereupon I lost patience with Mr. Mallock and wrote the following letter to *The Times*.

MR. MALLOCK'S IDEALS.

TO THE EDITOR OF THE TIMES.

Sir,—Mr. Mallock's controversy with Mr. Chiozza-Money over the figures of Mr. Keir Hardie may very well be left to the embarrassed silence in which good-natured people sit when a person of some distinction volunteers an absurd blunder as a contribution to a subject which he has not mastered. The notion that the people who are now spending in week-end hotels, in motor cars, in Switzerland, the Riviera, and Algeria the remarkable increase in unearned incomes noted by Mr. Keir Hardie have ever invented anything, ever directed anything, ever even selected their own investments without the aid of a stockbroker or solicitor, ever as much as seen the industries from which their incomes are derived, betrays not only the most rustic ignorance of economic theory, but a practical ignorance of society so incredible in a writer of Mr. Mallock's position that I find it exceedingly difficult to persuade my fellow Socialists that he really believes what he teaches. They regard me as a cynic when I tell them that even the cleverest man will believe anything he wishes to believe, in spite of all the facts and all the text-books in the world.

However, that is not the point that moves me to utterance on this occasion. If Mr. Mallock does not know the difference between the rents of land and capital and the "rent of ability"—if he is so ignorant of ordinary business and patent law as not to know that the cleverest inventor cannot possibly extract a farthing more from his invention than his stupidest competitor when it has been communized 14 years after its registration—he must not expect the Socialists to educate him. My quarrel with him is deeper than the technics of distribution. Mr. Mallock is preaching an ideal; and I want every gentleman in England to repudiate that ideal, whether he be Socialist, Individualist, Liberal, Free Fooder, Tariff Reformer, or Home Ruler.

The ideal is, not that the greatest among you shall be servants of all the rest, but that whenever one of us discovers a means of increasing wealth and happiness, steps should be taken to restrict the increase to the discoverer alone, leaving the rest of the community as poor as if the discovery had never been made. If Mr. Mallock does not mean this, he means nothing. If he does mean it, what does his University say to him? What does the Church say to him? What does every officer in the Army and Navy say to him? What does every Civil servant say to him, every statesman, every member of the humblest local authority, every professional man, every country gentleman, every man of honor, gentle or simple, who asks no more than a sufficient and dignified subsistence in return for the best service he is capable of giving to his country and to the world? This is not a question of the difference between the Socialist and the anti-Socialist: it is a question of the difference between the gentleman and the cad. Lord Lansdowne is not a Socialist, and Lord Charles Beresford is not a Socialist; but Lord Lansdowne has not asked for the hundreds of

millions he saved Europe by making our treaty with Japan, and Lord Charles Beresford, if the German fleet attacked ours, would not refuse to conduct our naval defence unless the country were to be given to him as prize money when he had saved it. It is true that we have tradesmen—some of them in business on a very large scale both here and in America—impudent enough and base enough to demand for themselves every farthing that their business ability adds to the wealth of their country. If these *canaille* were surgeons with a monopoly of a capital operation, they would refuse to save a patient's life until they had extorted his entire fortune as a fee. If they were judges, they would sneer at a judge's modest £5,000 a year, and demand the total insurance value of the protection they afforded to society. If they were lifeboat coxswains or firemen, they would bargain for the kit of a drowning sailor or the nighty of a child in a burning house before they would throw a lifebuoy or mount a ladder. They are justly despised by men of Mr. Mallock's profession and education; and when Mr. Mallock challenges the right of our workmen to a share in the increased product of industry by asking whether their labor "has become more productive in respect of the laborer's own exclusive operations," he not only lays himself open to the obvious counter-question as to whether the "exclusive operations" of our employers could produce anything more than the exclusive operations of our laborers, but, what is far more serious, he seems to be lending the credit of his reputation, his education, and the high social and intellectual prestige of his class to the most abandoned sort of blackguardism that is still outside the criminal law.

It is fortunate for us that few of our tradesmen are so vile or so silly as the commercial theory by which theorists attempt to justify them. The man who has "made" £20,000 a year for himself knows very well that his success does not afford the smallest presumption that his services have been more important than those of a police-constable with 24s. a week. He does not dream of posing as the superior of the captain of a battleship with a modest income of three figures. Mr. Carnegie "divides up" his surplus millions, and makes wildly Socialistic proposals, never for a moment suggesting that he is 50 times as clever as Mr. Mallock because he is 50 times as rich. I am not supposed to be an exceptionally modest man; but I did not advance the fact that I have made more money by a single play than Shakespear did by all his plays put together as a simple proof that I am enormously superior to Shakespear as a playwright. Our millionaires unload—awkwardly and unwisely sometimes, it is true, but still they unload—and do not talk nonsense about being 650 times as clever or as sober or as industrious as a dock-laborer because they have 650 times his income. The man who pretends that the distribution of income in this country reflects the distribution of ability or character is an ignoramus. The man who says that it could by any possible political device be made to do so is an unpractical visionary. But the man who says that it ought to do so is something worse than an ignoramus and more disastrous than a visionary: he is, in the profoundest Scriptural sense of the word, a fool.

In conclusion, may I confess that nothing is so terrifying to the Socialist to-day as the folly of his opponents? There is nothing to keep the inevitable advance steady, to force the rank and file to keep their best men forward. A paper called *The Anti-Socialist* is brought out with a flourish of trumpets. I open it, and find *vers de société* and a caricature of myself by a French artist, who depicts me in a French frock-coat, a Grand Old Man collar, and the countenance of Henri Rochefort. A Belgian navy is labelled "Ramsay Macdonald": an American knockabout from the *café chantant* is carefully marked "Keir Hardie." Is it worth while to spend so much money to provide our Socialist debaters with footballs? If the Socialists did not know the difficulties of Socialism better than their opponents, and were not therefore far sterner Tories than the tariff reformers and far sounder Liberals than the free-traders; if all decent men were not nine-tenths Socialists to begin with, whether they know it or not; if there were any possibility of controversy as to the fundamental proposition of Socialism that whoever does not by the work of his prime repay the debt of his nurture and education, support himself in his working days, and provide for his retirement, inflicts on society precisely the same injury as a thief, then indeed the prospect would be black for civilization. As it is, I will continue to back the red flag against the black one; and with that I leave the Anti-Socialist League to sweep up the fragments of Mr. Mallock and produce their next champion.

Yours truly,

G. BERNARD SHAW.

Feb. 2.

Mr. Mallock made two replies to this letter. The first was sent to *The Times*, the readers of which had had my letter before them. It is practically a surrender without a blow. The second was sent to the other daily papers, the readers of which had not seen my letter. It is an attempt to retreat in fighting order.

The *Times* letter is as follows.

MR. BERNARD SHAW ON MR. MALLOCK.

TO THE EDITOR OF THE TIMES.

Sir,—If Mr. Bernard Shaw cares to look into the pages of my "Critical Examination of Socialism," he will find the opinion or "ideal" which he attributes to me stated with the most minute precision and emphatically repudiated. So far as I myself am concerned, his long letter is absolutely without relevance.

I am your obedient servant,

February 5.

W. H. MALLOCK.

The letter to the other papers ran thus :

MR. MALLOCK AND G. B. SHAW.

TO THE EDITOR OF THE MORNING ADVERTISER.

Sir,—Mr. Shaw, although in his letter to the press, published this morning, he diverges into a variety of details, says that his main object is to criticise an opinion, or an "ideal" which he imputes to myself. The ideal translates itself into the doctrine that whatever increment of wealth is produced by ability as distinct from labor ought to be entirely appropriated by the gifted individual producing it, and that nobody else should receive from it any benefit. I have no right to demand that Mr. Shaw should read my writings, but it is reasonable to demand that he should read them before he attempts to criticise my opinions or "ideals." If he had taken the trouble to read my "Critical Examination of Socialism," he would have found that the particular ideal or opinion which he imputes to me is described in that book with the utmost precision, but is described only that it may be in precise terms repudiated.

On page 202 he will find the following passages :—"If, therefore, the claims of labor are based on, and limited to, the amount of wealth which is produced by labor itself . . . what labor would receive would be far less, not more, than what it receives to-day. . . . Is it, then, here contended, many readers will ask, that if matters are determined by ideal justice, or anything like practical wisdom, the remuneration of labor in general ought henceforth to be lessened, or, at all events, precluded from any possibility of increase? . . . If anyone thinks that such is the conclusion which is here suggested, let him suspend his opinion until we return to it, as we shall do, and deal with it in a more comprehensive way." This question is taken up again, page 283, as follows :—"Is it, then, the reader will ask, the object of the present volume to suggest that the true course of social reform in the future . . . would be to bind down the majority to the little maximum they could produce by their own unaided efforts? The object of this volume is the precise opposite. It is not to suggest that they should possess no more than they produce. It is to place their claim to a surplus not produced by themselves on a true instead of a fantastic basis." Mr. Shaw may be left to read what follows if he pleases.

With regard to two other definite points, he touches farther on what he calls my opinions, or my "rustic ignorance" of economics. One of these relates to the "rent of ability." If he turns to pages 191-193 of my "Critical Examination of Socialism," he will find this question discussed with great minuteness, the truth contained in the doctrine held by himself and other Socialists admitted and endorsed, and an element in the problem, which is yet more important, but to which they are entirely blind, specified. With regard to what Mr. Shaw says about conflagrations and "babies' nighties," he will find this precise point anticipated and dealt with on page 122, "Critical Examination." I have, let me repeat, no right to claim that Mr. Shaw should read a line of anything I have written; but if in attempting to criticise the opinions and "ideals" of a writer, he imputes to him an ignorance or neglect of problems, e.g., the rent of ability, which he has discussed far more minutely than has

Mr. Shaw himself, and attributes to him opinions which he has elaborately repudiated, Mr. Shaw will have hardly added to his reputation as a critic either of economic theory or of anything else. Mr. Shaw writes about myself very much as a man would write who mistook the Book of Genesis for the Koran.

I am, Sir, yours, etc.,

February 5, 1909.

W. H. MALLOCK.

I am usually willing "to build a bridge of silver for a flying foe," but in this case I cannot let Mr. Mallock off without pursuing him to utter extinction. The book to which Mr. Mallock refers as shewing that he has dealt with my argument does nothing of the kind: it reaffirms his error as strongly as he knows how to do it. Even if it contained a recantation, I should still have to deal with his unprovoked attack on Mr. Keir Hardie, and with his "Short Epitome of Eight Lectures on the Principal Fallacies of Socialism," in which he speaks of the Socialist "promise of distributing among the great mass of the population that portion of the annual income *which is at present in the hands of an exceptionally able minority.*"

But the Critical Examination of Socialism contains no recantation. What it does contain is a statement that though everything that men enjoy over and above what a savage can wring from nature with his unaided hands is due to the exceptional ability of the few (represented, Mr. Mallock implies, by our rich class to-day) yet it is not expedient to strip them of everything they possess above that level, as otherwise they would have no interest in civilization, and would revolt. Therefore Mr. Mallock promises to shew, in a future book, how society can be arranged so as to give us all just enough to bribe us to allow the rich to remain in undisturbed enjoyment of their present position. If anyone doubts the fairness of this description of Mr. Mallock's last chapter, the book is easily accessible in the excellent cheap edition published by John Murray in November, 1908. In spite of the extravagance of the fundamental proposition of the book, which is that what a man produces is "that amount of wealth which would not have been produced at all had his efforts not been made" (pp. 206-7), thereby making every necessary laborer the producer of the entire wealth of the world, it is well worth reading, because it happens that any prejudice that may still linger against Socialism is almost wholly based on such childish ignorance of existing social conditions, and defended by such absurd arguments, that Mr. Mallock is forced by his sense of intellectual honor to begin by making a clean sweep of the blunders of his own supporters. In doing so, he knocks the bottom out of Unsocialism as effectively as in his religious polemics he has knocked the bottom out of the vulgar sectarianism that passes for religion in this country. His object is to clear the ground for his own peculiar Individualism and Catholicism; but he has cleared it equally for the Fabian Society, which has the same interest as Mr. Mallock in dispelling ignorance and confusion of thought. Besides, it is as well that the world should know that just as it seems clear to many laborers that the men who walk about in frock coats and tall hats, talking and writing letters,

are not workers at all, and produce nothing, so these very frock-coated men believe, like Mr. Mallock, that the hired laborer is a brainless machine that owes the very fuel and grease that keep it working to the intelligence of the class that exploits it.

However, I need not argue the case with Mr. Mallock now. It happens that in 1894 a wave of discussion of Socialism was passing over the press. Mr. Mallock was then already ventilating his theory that the distribution of wealth in this country into big fortunes for the few and pittance for the many, corresponds to the natural division of the British race into a handful of geniuses and many millions of mediocrities. His diagrams are still extant to shew the lengths to which he went. Mr. Frank Harris was then editing *The Fortnightly Review*. He asked me could I answer Mr. Mallock. I replied boyishly that any Socialist over the age of six could knock Mr. Mallock into a cocked hat. He invited me to try my hand; and the result was the following essay, which appeared in the *Review* in April, 1894. I emphasize the date to shew that Mr. Mallock has had plenty of time to consider my case and answer it. When he put forth his *Critical Examination of Socialism* and accused Mr. Keir Hardie of illiterate ignorance, he forgot that his own Unsocialism had been critically examined, and that Mr. Keir Hardie had all the classic economists, from Adam Smith to Cairnes, at his back. Mr. Keir Hardie is, in fact, on this subject, demonstrably a better read and better informed authority than Mr. Mallock.

I reprint my arguments as they appeared in 1894. During the fifteen years since, Oblivion has made a few topical allusions unintelligible, and Death has changed some present tenses into past ones. I have dealt with these by a few inessential alterations, and omitted some chaff and some literary digressions; but the case against Mr. Mallock stands as it did.

SOCIALISM AND SUPERIOR BRAINS.

MR. MALLOCK's general proposition is, that exceptional personal ability is the main factor in the production of wealth, and that the Fabian essayists, by failing to grasp this, have greatly exaggerated the efficiency of mere labor in the production of wealth. Let me see whether the irrepressible smile which this accusation has produced upon the countenances of the essayists can be transferred to those of the public, and finally to that of Mr. Mallock himself.

First, it is clear that such huge populations as ours really do owe their very existence to what Mr. Mallock defines as Ability, and not to what he defines as Labor. The whole advantage of a Transatlantic steamship over a man paddling on a tree-trunk, of a Great Northern express over a pilgrim's staff, of a Nasmyth steam hammer over the lump of stone which St. Jerome uses to beat his breast in the pictures of the Old Masters, or of a power-loom over the plaiting power of the fingers: all this is the product, not of Labor, but of Ability. Give Labor its due, says Mr. Mallock; and it will receive only what it could produce if Ability had never existed. Now this would clearly be much less than enough to support even a fragment of our present population. Therefore, since Labor gets enough at present to keep it half alive or so, it must get more than its due (Mr. Mallock calculates forty per cent. more, though surely several thousand per cent. would be nearer the mark); and the excess is a clear tribute levied upon Ability for the benefit of Labor. I take it that this is an inexpugnable proposition. Far from repudiating it, as Mr. Mallock would seem to expect, I embrace it in the spirit in which Mrs. Gamp asked Mrs. Prig, "Who deniges of it, Betsy?" What on earth use would Ability be to us if it did not lighten our toil and increase our gain? We support and encourage Ability in order that we may get as much as possible out of it, not in order that it may get as much as possible out of us. Mr. Mallock seems to regard this as dishonest. Possibly it is; but it is the sole safeguard for the existence of men of Ability. Give them and their heirs the entire product of their ability, so that they shall be enormously rich whilst the rest of us remain just as poor as if they had never existed; and it will become a public duty to kill them, since nobody but themselves will be any the worse, and we shall be much the better for having no further provocation to the sin of envy.

The Able Inventor.

This does not seem to have struck Mr. Mallock until the first appearance of this article in 1894. He had been preoccupied by the danger of the opposite extreme—that of grabbing the entire product of exceptional ability, and thus depriving it of its commercial

incentive to action. Fortunately, society is not bound to go to either extreme: its business from the commercial point of view is to get the use of ability as cheaply as it can for the benefit of the community, giving the able man just enough advantage to keep his ability active and efficient, if it should really turn out that able men will act stupidly unless they are given extra pay. From the Unsocialist point of view this is simply saying that it is the business of society to find out exactly how far it can rob the able man of the product of his ability without injuring itself, which is precisely true (from that point of view), though whether it is a reduction of Socialism to dishonesty or of Unsociasim to absurdity may be left an open question. Happily we need not dwell on the moral question, since we have long ago adopted the Socialist point of view in every case in which the working of our industrial system admits of it. Take Mr. Mallock's pet example, the inventor. His ability produces untold millions. Machine after machine is invented of which we are told that it has multiplied the productivity of labor twice, ten times, two hundred times, fourteen thousand times, and so on beyond the bounds of belief; and processes are devised by which metals are so strengthened that the formerly impossible is now possible, the gain being consequently incalculable. What do we do with the public benefactors who shew us how to perform these marvels? Do we allow them and their remotest posterity to wallow in the full product of their ability, and so lose all incentive to further exertion? Not a bit of it. We announce to them our intention of making their invention public property in fourteen years time, during which, provided they pay us certain fees for the privilege, we allow them by patent such a power of veto on the use of the invention as enables them to secure during that period a share—and only a share—of its product. If at the end of the fourteen years they can prove to us that their invention has made its way so slowly that they have not been reasonably repaid for their actual expenditure in time and money, we may perhaps extend their privilege for a further short period. But after that comes naked Socialistic expropriation, making the use of the invention free to the stupid and the clever alike.

The Able Author.

To vary the illustration, let us take the case of Mr. Mallock himself. For aught we know, Mr. Mallock's novels may outlive Don Quixote and Tom Jones; and his economic essays may stand as long as Aristotle's. The difference in value between a page of one of his works and the advertisement sheet of a daily newspaper is wholly due to his ability, ability of an order which it is admittedly the highest duty of statesmanship to encourage to the utmost. Yet how socialistically we treat Mr. Mallock! We reward his exertions by an offer to lend him his own books for forty-two years, after which the dullest bookseller in the land will be free to send his works to the printer and sell them without paying a farthing to the author's heirs. And nobody suggests, as far as I know, that

if we were to extend the duration of patents and copyrights to a million years, we should get one book or one invention the more by it.

Now let us suppose that on the expiration of Mr. Mallock's copyrights the cheap bookseller of the period were to make £10,000 by getting out a cheap edition of *The New Republic*, and were to call his gains the product of literary genius. The statement would be quite accurate; but if he were to go on to claim any special sacredness (say from taxation) for his £10,000 on that account, he would be promptly met by the question, *Whose* literary genius? And when he replied, as he would have to, "Well, William Hurrell Mallock's genius," his fellow citizens would certainly inform him that they were not, if they could help it, going to privilege him because somebody else was a great writer. Now I will not say that any railway shareholder to-day is so absurd as to plume himself on the fact that his dividends are the product of inventive genius, leaving it to be inferred that the genius is his own and not George Stephenson's; but passage after passage in Mr. Mallock's anti-Socialist writings either means that a railway dividend is the reward of the ability which invented the locomotive steam-engine or else means nothing at all. The obvious fact that the interest on railway stock in this country is paid mostly to people who could not invent a wheelbarrow, much less a locomotive, he treats as an ingenious Fabian paradox. And a cool assumption that every child, every woman of fashion, every man about town, every commonplace lady or gentleman who holds shares in an electric lighting company, or a telephone company, or a Transatlantic steamship company, is a Wheatstone, a Bell, an Edison, a Bessemer, a Watt, or a Stephenson, he gravely reasons upon, and takes as a basis for elaborate statistical calculations and startling diagrams, as if it were sober sense instead of the most laughably extravagant bluff that has ever been attempted, even in a controversy on Socialism. I am convinced that Mr. Mallock himself, now that I have placed his argument naked before him, will throw himself on the mercy of the town, and ask whether it is likely that so clever a man as he could have meant anything so outrageous. But there are his figures, graphic and arithmetical, to shew that he meant that interest on capital is the price of exceptional ability, and that profits include payment for every human invention, from the potter's wheel to the marine steam-engine. Let me not here seem to disparage his common sense offensively. I cannot seriously believe that if some relative were to leave him a million of money, he would say to his stockbroker, "I am not satisfied with being a well-known author: I wish to be a great engineer too; so buy me some Manchester Ship Canal stock. I also yearn for fame as an aviator: get me instantly a few shares in the company which manufactured Monsieur Bleriot's aeroplane. As I wish to secure immortality as a great sculptor, I shall call a great statue into existence by my capital: no doubt Monsieur Rodin or some other professional person will put in the mere manual labor for a few thousand guineas. I have also, I must confess, a curious longing to be

remembered as a famous actress : I shall therefore build a theatre and engage Sarah Bernhardt, Eleonora Duse, and one or two other female proletarians, who, without the aid of capital, would be selling oranges like Nell Gwynne." I feel sure Mr. Mallock has far too much ability to go on in any such insane way ; and I even believe that if a laborer were to write articles claiming that labor was so mighty that one workman could with a single stroke knead a mass of metal as if it were a lump of dough or slice a bar of steel like a cucumber, Mr. Mallock would smash such idiotic pretensions with the utmost brilliancy. Therefore, as I say, I am loth to trip him up for having advanced cognate pretensions on behalf of the shareholding class. I had rather by far hold my tongue ; and I would have done so if only Mr. Mallock would leave the Fabians and Mr. Keir Hardie, who never injured him, unmolested. Why cannot a man write bad political economy without coupling it with an attack on the Fabian Society ? The profit is naught ; the retribution sudden, swift, and fearful.

Ability at Supply-and-Demand Prices.

The facts about "rent of ability" are not so simple as Mr. Mallock thinks. To begin with, the price of ability does not depend on merit, but on supply and demand. Plato was, on the whole, a greater author than Old Moore, the almanack maker ; but if he were alive now he would not make so much money by his books. When Ibsen died he was unquestionably the greatest dramatist of the nineteenth century ; but he was very far indeed from being the richest. Great philosophers and poets are apt to starve because, as their wares are above the heads of the public, there is no demand and therefore no price, although the commodity offered is very scarce and precious. But when the ability is of a sort everyone can appreciate, or, above all, that can make money or cure illness, there is no lack of demand. Sometimes there is no lack of supply either : for instance, in a modern city the policemen, the firemen, the sewer-men, are supposed to save property, life, and health wholesale : yet their ability is to be had without stint for twenty-four shillings a week or thereabouts, because the supply is large. Not so the supply of popular portrait-painters, novelists, dramatists, consultant physicians, special pleaders, and directors and organizers of industry. These popular persons get large sums, not because their talents are more useful to society than those of the policemen, but solely because they are scarcer.

Imaginary Ability.

I say popular persons rather than able persons ; for the public is often a very bad judge of ability. For example, there died a short time ago a barrister who once acquired extraordinary celebrity as an Old Bailey advocate, especially in murder cases. When he was at his zenith I read all his most famous defences, and can certify that he always missed the strong point in his client's case and the weak one in the case for the prosecution, and was, in short,

the most homicidally incompetent impostor that ever bullied a witness or made a "moving" but useless appeal to a jury. Fortunately for him the murderers were too stupid to see this: besides, their imaginations were powerfully impressed by the number of clients of his who were hanged. So they always engaged him, and added to his fame by getting hanged themselves in due course. In the same way a surgeon will get a reputation as the only possible man to consult in cancer cases simply because he has cut off more breasts than anyone else. The fact that in all the professions there is one first favorite means no more than the fact that there is only one editor of *The Times*. It is not the man who is singular, but the position. The public imagination demands a best man everywhere; and if Nature does not supply him the public invents him. The art of humbug is the art of getting invented in this way. Every generation invents great men at whom posterity laughs when some accident makes it aware of them. Even in business, the greatest reputations are sometimes the result of the glamor of city superstition. I could point to railway chairmen reputed indispensable, whom the shareholders and the travelling public might with great profit and comfort to themselves send to St. Helena with a pension of £10,000 a year.

The Ability that Gives Value for Money.

But in business, as a rule, a man must make what he gets and something over into the bargain. I have known a man to be employed by a firm of underwriters to interview would-be insurers. His sole business was to talk to them and decide whether to insure or not. Salary, £4,000 a year. This meant that the loss of his judgment would have cost his employers more than £4,000 a year. Other men have an eye for contracts or what not, or are born captains of industry, in which cases they go into business on their own account, and make ten, twenty, or two hundred per cent. where you or I would lose five. Or, to turn back a moment from the giants to the minnows, take the case of a woman with a knack of cutting out a dress. She gets six guineas a week instead of eighteen shillings. Or she has perhaps a ladylike air and a figure on which a mantle looks well. For these she can get several guineas a week merely by standing in a show-room letting mantles be tried on her before customers. All these people are renters of ability; and their ability is inseparable from them and dies with them. The excess of their gains over those of an ordinary person with the same capital and education is the "rent" of their exceptional "fertility." But observe: if the able person makes £100,000, and leaves that to his son, who, being but an ordinary gentleman, can only get from two and a half to four per cent. on it, that revenue is pure interest on capital and in no sense whatever rent of ability. Its confiscation would set an idle man to work instead of depriving ability of its motive for exertion. When the late Lord Goschen was Chancellor of the Exchequer, he confiscated a half per cent. of the interest on Consols without checking the exercise of

ability in the least. Later on, when the value of even the reduced Consols was further reduced twenty-five per cent. by the South African War, and simultaneously the Income Tax (which is pure confiscation) jumped up to a shilling in the pound, the effect was not to dull our wits but to sharpen them. Raise a tradesman's rent (a very common form of private confiscation) and he works harder, not softer.

Waste of Ability and Inflation of its Price by The Idle Rich.

Let us consider now how far exceptional payments depend really on the ability of the earner, and how far on the social conditions under which they occur. To begin with a striking instance. A famous painter charges, and gets, 2,000 guineas for painting a portrait. Such a price is rendered possible solely by the existence of a class of patrons so rich that the payment of 2,000 guineas inflicts less privation on them than the payment of sixpence to an itinerant photographer on Hampstead Heath inflicts on a courting costermonger. These portraits are as often as not portraits of persons of average or inferior ability. If such persons had to earn the price of their portraits by their own labor, they would not pay two guineas, much less 2,000, for a portrait. On the other hand, the painter demands 2,000 guineas solely because he finds that he can get it, not in the least because his genius refuses to operate under a weaker stimulus. He will paint as good a portrait for £50 as for £2,000 if £50 is the top of his market: greater painting than any yet produced in Melbury Road or Fitzjohn's Avenue has been worse paid than that. The fashionable physician, the surgeon pre-eminently skilled in some dangerous operation, the Parliamentary barrister, all owe the excess of their incomes over that of, say, a cabinet minister, to the competition among enormously rich people or huge companies for their services. In order to state the case in the most foolish possible way, let me put it that modern Capitalism has created thousands of guineas' worth of professional ability where only tens and hundreds existed before. All that this means is that it has raised the price of certain sorts of ability twenty-fold without at all improving their quality. And in enabling idle rich people to buy up the best of this ability, it has greatly wasted and nullified it. The eminent painter paints unmemorable people; the fashionable physician preserves the lives of useless people; the Parliamentary barrister would be more useful to society as an upper division clerk in the legal branch of some public department. Generally speaking, it may be said that our 'capitalists pay men of ability very highly to devote their ability to the service of Capitalism; and the moment society begins to outgrow the capitalistic system, it is no longer permissible to assume that ability devoted to the service of Capitalism is serviceable to society, or, indeed, that ability which can only flourish in that way is, from the social point of view, ability at all.

Artificial Rent of Ability.

One result of that social inequality which Capitalism produces, and which Mr. Mallock admires as innocently as Pendennis admired Miss Fotheringay, is to produce an enormous artificial rent of ability. Just as high farming increases the yield of an acre of land, so education may increase the yield of a man. But high farming cannot increase the natural rent of an acre, since all the other acres can be high-farmed too; so that the difference between the worst acre and the best (otherwise the "economic rent") can be reduced finally by equality of cultivation until it is no longer greater than the natural difference in fertility. Just so, by educating everybody, the social advantage which the educated man now has over the uneducated one can be destroyed, as it has been in the upper classes to-day. Again, enormous salaries are now paid to men because they add to ordinary business qualifications the habits and "manners and tone" of people who have unearned incomes of £10,000 a year and upward. By doing away with such incomes of idleness, society could make such habits impossible, and such manners and tone ridiculous. If Mr. Mallock will only consider that at present the mass of our population is so poor that any presentable sort of literateness or social amenity, down even to personal cleanliness and a reasonable reticence in the matter of expectoration, has a distinct scarcity value, he may gain some faint suspicion of how much of that £490,000,000 a year which we pay in profits and salaries represents rent, not of natural ability, but of social opportunity.

Artificial Ability.

There is another sort of artificial superiority which also returns an artificial rent: the superiority of pure status. What are called "superiors" are just as necessary in social organization as a keystone is in an arch; but the keystone is made of no better material than many other parts of a bridge: its importance is conferred on it by its position, not its position by its importance. If half-a-dozen men are cast adrift in a sailing boat, they will need a captain. It seems simple enough for them to choose the ablest man; but there may easily be no ablest man. The whole six, or four out of the six, or two out of the six, may be apparently equally fit for the post. In that case, the captain must be elected by lot; but the moment he assumes his authority, that authority makes him at once literally the ablest man in the boat. He has the powers which the other five have given him for their own good. Take another instance. Napoleon gained the command of the French army because he was the ablest general in France. But suppose every individual in the French army had been a Napoleon also! None the less a commander-in-chief, with his whole hierarchy of subalterns, would have had to be appointed—by lot if you like—and here, again, from the moment the lot was cast, the particular Napoleon who drew the straw for commander-in-chief would have been the great, the all-powerful Napoleon, much more able than the Napoleons who were corporals and privates. After a year, the difference in ability

between the men who had been doing nothing but sentry duty, under no strain of responsibility, and the man who had been commanding the army would have been enormous. As "the defenders of the system of Conservatism" well know, we have for centuries made able men out of ordinary ones by allowing them to inherit exceptional power and status; and the success of the plan in the phase of social development to which it was proper was due to the fact that, provided only the favored man were really an ordinary man, and not a duffer, the extraordinary power conferred on him did effectually create extraordinary ability as compared with that of an agricultural laborer, for example, of equal natural endowments. The gentleman, the lord, the king, all discharging social functions of which the laborer is incapable, are products as artificial as queen bees. Their superiority is produced by giving them a superior status, just as the inferiority of the laborer is produced by giving him an inferior status. But the superior income which is the appanage of superior status is not rent of ability. It is a payment made to a man to exercise normal ability in an abnormal situation. Rent of ability is what a man gets by exercising abnormal ability in a normal situation.

How Little really goes to Ability.

If Mr. Mallock will now take his grand total of the earnings of Ability, and strike off from it, first, all rent of land and interest on capital; then all normal profits; then all non-competitive emoluments attached to a definite status in the public service, civil or military, from royalty downwards; then all payments for the advantages of secondary or technical education and social opportunities; then all fancy payments made to artists and other professional men by very rich commonplace people competing for their services; and then all exceptional payments made to men whose pre-eminence exists only in the imaginative ignorance of the public, the remainder may with some plausibility stand as genuine rent of natural ability. But in making these calculations, I would warn him against exaggerating the life incomes of the most envied professional men and skilled workers. It is not for nothing that highly educated and cultivated men go into that part of Socialism which already exists, the Civil Service, and leave the competitive prizes of the professions to be scrambled for by persons who, as a class, are by no means their superiors. In the Civil Service there is status; there is pay from the time you begin work; there are short hours and at least the possibility of good health; there is security; there is a pension; and there is early marriage without imprudence or misalliance. In the professions the beginners are forty; there is no security; health is impossible without the constitution of a thousand horses; work never ceases except during sleep and the holidays which follow the usual breadown two or three times a year; shirking or taking things easily means ruin; the possibilities of failure are infinite; and the unsuccessful professional man is wretched, anxious, debt-crippled, and humbled beyond almost any

other unfortunate who has mistaken his vocation. If the income which a successful man makes between forty-five and sixty-five be spread over the preceding twenty years; if the severity of the brain-work as compared with that needed for any sort of routine be taken into account; and if a sufficient allowance be made for that part of the remuneration which may fairly be regarded as high interest on a frightfully risky investment, I think Mr. Mallock will begin to understand why the State can even now get into its service at moderate salaries men no less able than the professions attract, especially among those who have had a first-rate education, but who have to begin to support themselves immediately their education is finished.

The same care should be taken in estimating those high wages for manual labor which sometimes make the needy gentleman envy the boiler-maker or the steel-smelter. Such workmen, if their physique is extraordinary, can make £8 a week in the prime of life. But the prime of life does not last very long at work that fetches that price. It is as well worth a strong man's while to be a policeman with a sixth of such wages. Mr. Mallock was once greatly struck with the wages earned by the coal-hewers during the boom of 1872-3: he never tired of telling us stories of the dogs fed on beef-steaks, of the pipes with four bowls, and the rest of the evidence that the world is not going to be reformed offhand by giving £5 a week to men who have never had the chance of learning how to spend two. He might have added that mortality statistics bring out coal-mining as a healthy occupation, the truth being that when a miner is past his best working period, he has to fall back on some poorer occupation above ground, so that but few men die coal-miners. From one end to the other of the social scale nothing is more misleading than to assume, in the case of those who are paid competition wages, fees, or salaries, that they receive the top price paid in their profession or trade constantly throughout their whole working life. Further, in estimating the value of large salaries and high fees, it is necessary to take into account how much of it is mere payment of the expenses involved by the social position in which alone they can be earned. A young man building up a fashionable practice as a doctor in London cannot save a farthing out of £1,000 a year, though his personal tastes may be so inexpensive that in the Civil Service he would save £200 a year out of a salary of £400 without the least privation. As was pointed out, I think, in *Fabian Essays*, the servants in Dublin Castle are better paid than the Lord Lieutenant of Ireland, because they can live on their wages, whereas he cannot. Mr. Mallock expresses the greatest scepticism as to the Fabian estimate of £800 a year *real* salary as sufficient to attract men of first-rate ability and education at present. No doubt it seems a trifle when one fixes one's eyes on the men who are making from £10,000 to £20,000 a year at the professions, or on the millionaires of America. But you have only to look in other directions to find men of at least equal ability and character to whom an assured income of £800 a year would be

a fortune. At all events, the hard fact remains that neither in our civil nor military services do we find it necessary to pay salaries equal to the income of a leading financier, contractor, physician, or K.C. As to chemists, biologists, astronomers, mathematicians, economists, poets, and the higher brainworkers generally, no fairly prosperous publican would look at their professional incomes.

Socialism the Paradise of the Able.

It seems to me that Social-Democracy would, in comparison, be the paradise of the able man. Every step that we make towards it takes our industry more and more out of the hands of brutes and dullards. The fellow who in the first half of the nineteenth century (the wicked century, as posterity will call it) could make a fortune out of cotton spinning only on condition that he was allowed to use up nine generations of men mercilessly in one generation, has been driven out of the trade by that pioneer of Socialism, the factory inspector. When the working day in England is reduced to eight hours by law, and the employment of a human being at less than a living wage is made a felony, the incompetents who cannot make their trade self-supporting on these humane and reasonable conditions will simply have to see their business slip from them into the hands of those who can. The sweater will have to go the way of the flogging schoolmaster, or the captain who can only maintain discipline by making his ship a floating hell. Society will keep raising the standard of popular welfare to which industrial management must be adjusted, until an employer will no more be allowed to kill people by overwork or poisonous processes than he is now to kill them by sword or gun. And at every step of the process a fringe of the most selfish and stupid employers will be disqualified and beaten off into the ranks of the employed, their customers going to swell the business of men with ability enough to succeed under the new conditions. If there be any employer who will be "ruined" by having to reduce the hours of labor of his employees from ten, twelve, fourteen, or sixteen to eight, or to raise their wages from four, twelve, or sixteen shillings a week to twenty-four or thirty, then the sooner he is "ruined" the better for the country, which is not benefited by allowing its population to be degraded for the benefit of duffers. Mr. Mallock is right in supposing that Socialism, if it wants ability, will have to pay for it, but quite wrong in supposing that the price will be eight-thirteenths of the national product.

The Highest Work also the Cheapest.

I am by no means sure that an occupation so exceedingly agreeable to the men able to do it well as the organization of industry may not at last come to be cheaper in the market than the manual labor involved by such disagreeable and dangerous tasks as sewerage, foundry work, stoking, certain kinds of mining, and so on. Clearly, if Mr. Mallock or myself had to choose between managing an iron-works for £250 a year and puddling for £500, we should

jump at the £250. In fact, it is already evident that numbers of the occupations now filled by the working classes will eventually have either to be replaced by new processes or else dropped altogether, through the impossibility of finding men or women willing to submit to them. Nobody anticipates any such difficulty with regard to the pursuits of the middle classes. Already, in many manufacturing towns, it is difficult to get even a half-witted domestic servant. The girls prefer the mill to the kitchen. But there is no difficulty in getting matrons for public institutions. How is it that Mr. Mallock, who has himself chosen a profession in which, unaided by clerks, he has to exercise ten times the ability of a stockbroker for perhaps a fifth of what the stockbroker would consider handsome remuneration, seems never to have considered the very first peculiarity of exceptional ability, namely, that unlike mere brute capacity for the drudgery of routine labor, it is exercised for its own sake, and makes its possessor the most miserable of men if it is condemned to inaction? Why, bless my heart, how did Fabian Essays, which Mr. Mallock admires so much, come to be written? Solely because the writers were able to write them, and, having the usual allowance of vanity, would not hide that ability under a bushel, though they knew beforehand that not one of them would ever touch a farthing of any pecuniary profit that might arise from the publication. If an ordinance were issued to-morrow that every man, from the highest to the lowest, should have exactly equal pay, then I could quite understand difficulties arising from every man insisting on being head of his department. Why Mr. Mallock should anticipate rather that all the heads would insist on becoming subordinates is more than I can reconcile with the intelligence for which he is famous. As a matter of fact there would be no novelty about the arrangement. Equal pay for persons of the most varied attainments exists at present within class limits. As to chiefs receiving less than subordinates, a naval captain's salary is smaller than that of many men in subordinate and relatively undignified commercial positions.

The Economics of Fine Art.

I might go on to make many amusing conjectures about the prodigious fortunes which great artists will perhaps make under Social-Democracy by simply putting a turnstile at the door of their studio or music-room, and charging five shillings a head for admission, which would presumably be freely paid by the cultured and prosperous millions of that period. But the economics of Art deserve an essay all to themselves. The difference between the baker, who produces something that is destroyed by the first consumer, and the artist, who produces something that is none the worse after generations of consumers have had their fill of it, is full of matter for the economist. And yet none of our professors have thought of writing a chapter on the Royal Academy turnstiles, which coin shillings in defiance of all the normal laws of production and consumption.

Profits and Earnings versus Rent and Interest.

Mr. Mallock has never got away from that unfortunate economic discovery of his about the hundreds of millions annually paid as rent and dividends being created by the ability of the recipients. During his lifetime he has seen several thousand millions of it produced by labor and ability, and then handed over gratuitously to "the man who has only to take a pair of scissors and to clip coupons, or to write a receipt for the tenant who pays him rent" (I borrow the phrase from that excellent Conservative, the late Prince Bismarck). Large shares of it pass daily under Mr. Mallock's very nose from adults to infants, from able men to imbeciles, from thrifty men to wasters, from all sorts of persons who might conceivably be producing something voluntarily and without compulsion for the community in return for what it unconditionally gives them, as Ruskin did, to ladies and gentlemen who make no pretence of producing anything. Must I again quote that well-worn passage from the late Professor Cairnes's *Some Leading Principles of Political Economy*, which formulated the conclusions of the orthodox economy on this subject, and which has never been challenged or contradicted by any economist until to-day, when Mr. Mallock dashes his head against it under the impression that it is a novel and dangerous heresy launched by a few sophistical Fabians? Here is the passage, which I quote with the more satisfaction, as nobody would tolerate such strong language from me :—

That useful function, therefore, which some profound writers fancy they discover in the abundant expenditure of the idle rich, turns out to be a sheer illusion. Political economy furnishes no such palliation of unmitigated selfishness. Not that I would breathe a word against the sacredness of contracts. But I think it important, on moral no less than on economic grounds, to insist upon this, that no public benefit of any kind arises from the existence of an idle rich class. The wealth accumulated by their ancestors and others on their behalf, where it is employed as capital, no doubt helps to sustain industry; but what they consume in luxury and idleness is not capital, and helps to sustain nothing but their own unprofitable lives. By all means they must have their rents and interest, as it is written in the bond; but let them take their proper places as drones in the hive, gorging at a feast to which they have contributed nothing.

What is the secret of the difference between the views of Cairnes and those of Mr. Mallock? Simply that Cairnes knew the difference between profits and general earnings on the one hand, and rent and interest on the other; whereas Mr. Mallock has jumped at the conclusion that because ability can produce wealth, and is rare, and men who are rich are also rare, these rich and rare ones must also be the able ones? How else can you account for them? How, indeed, if you happen to be still at the wrong side of that *pons asinorum* of political economy, the law of rent, with all its very unexpected social reactions! The Fabian essayists have done their best to convince Mr. Mallock that if the Duke of Westminster makes 500 times as much as a landlord as Mr. Mallock does as an author, it is not because the Duke is 500 times as clever as Mr. Mallock. But Mr. Mallock is modest, and will have it so; and I will worry him no further about it.

Government of the Many by the Few.

Mr. Mallock is much impressed by the fact that throughout history, from the shepherd kings to the nitrate kings and beef barons, we find the few governing the many. If by this he means that the few have ever been able to raise the many to their own level, then he is blind to the historical tragedy of greatness. But it is true that such organization as the many have been capable of has always been directed for them, and in some cases imposed on them, by the few. And I have no doubt that under Social-Democracy the few will still organize, and that, too, without having to consider at every step the vested interests of moneyed noodledom in "the system of Conservatism." Well has Mr. Mallock pointed out that the evolution of society produces, not anarchy, but new types of ruler, and, I would ask him to add, new forms of government. Once it was the first William with his sword and his barons. Then it was the first Edward, with his commission of *quo warranto*, bending the necks of those barons. But yesterday it was the cotton king with his capital and his ogreish factory: to-day it is the Factory Code bending the necks of the ogre cotton kings. To-morrow it may be—who knows?—an able Labor Ministry, backed up by a bureaucracy nursed on Fabian Essays. But Mr. Mallock's historic generalization will hold good: the few will still organize the many. That great joint-stock company of the future, the Social-Democratic State, will have its chairman and directors as surely as its ships will have captains. I have already pointed out that ships must have captains, even when there is an absolute level of ability on board, just as an arch must have a keystone. I cast back to that now only for the sake of reminding Mr. Mallock that this fact of the direction by the few of the many which he finds involved in all forms of social organization, has no necessary connection with any natural superiority on the part of the few. Indeed, Mr. Mallock will find it impossible to prove that the governing few have ever, in any generally valid sense, been the ablest men of their time. James I. governed Shakespeare: was he an abler man? Louis XV. and his mistresses governed Turgot: was it by their superiority in ability or character? Was Mr. Balfour an abler man than Mr. Asquith until the last general election? and has Mr. Asquith been the abler since? Have all the men who have governed Mr. Mallock been abler than he is?

These questions are nonsensical because, as Mr. Mallock himself has remarked, ability is not an abstract thing: it always means ability for some definite feat or function. There is no such thing as the ablest man in England, though there is such a thing as the ablest high jumper, the ablest hammer thrower, the ablest weight lifter, etc. When we come to more composite questions, such as the ablest financier, or strategist, or organizer of some particular industry, we call that man the ablest who has most of the qualities which happen to be supremely important, *under existing conditions*, in finance, strategy, or the particular industry in question. Change the conditions, and quite another set of men will be the ablest. Every year

gives us a fresh example of the fact that a man who has succeeded conspicuously in some enterprise in America may fail ignominiously in it in England, the reason being that he is an able man for the purpose under American conditions, and an incompetent one under English conditions. The Owenite Socialists who had made fortunes in business, failed to make good their reputation even for common sense in their attempts to organize Owenism. Or, to take one of Mr. Mallock's own illustrations, the able man of feudal England was quite a different man from the able man of commercial England. At least, let us hope so. As to Mr. Mallock's exceedingly unhistoric apprehensions that the said able men will refuse to exercise their ability for good pay and pension from Social-Democracy, unless they are also provided with opportunities of investing their savings in order to make idlers of their children, I doubt whether the public will take the alarm. He may depend on it that Social-Democracy, like all other Ocracies, will have a great deal more trouble with its idle and worthless members than with its able ones.

The Incentive to Production.

"Men," says Mr. Mallock, "will not exert themselves to produce income when they know that the State is an organized conspiracy to rob them of it." My impression hitherto has been that the whole history of civilization is the history of millions of men toiling to produce wealth for the express purpose of paying the tax-collector and meeting the State-enforced demands of landlords, capitalists, and other masters of the sources of production. Mr. Mallock might as well deny the existence of the Pyramids on the general ground that men will not build pyramids when they know that Pharoah is at the head of an organized conspiracy to take away the Pyramids from them as soon as they are made. Are not those very rents and dividends over which Mr. Mallock has so ingeniously gone astray, produced to-day by workers of all grades, who are compelled by the State to hand over every farthing of it to "drones," as Professor Cairnes called them? But the Attorney-General does not retire from the Bar because he has to hand over part of his fees to the lord of the plot of English soil on which his private house is built; nor did the factory girl refuse to toil, amid poisonous fumes of whitelead and phosphorus, because from ten to thirty per cent. of what she and the rest of the factory staff produced was taken from them and handed over to shareholders who never saw the factory, and whose original contributions to the cost of its crection had been replaced out of its own produce long before. When the State said, to Attorney-General and factory girl alike, "Submit, starve, or go to prison; which you please," they submitted, that being the most comfortable of the three alternatives. A Social-Democratic State could "rob" (the word is Mr. Mallock's, not mine) in the same fashion if its constituents, against their own interests, gave it a mandate to do so. If "the idle rich" (Professor Cairnes again) were taxed so heavily as to leave them nothing but bare agents' fees for the collection of their incomes and their transfer to the Inland Revenue Department, there is no

reason to suppose that the production of income would be decreased by a single farthing through any sulking of the despoiled spoilers. If a man is producing nothing, nobody can be the worse for a reduction of his incentive to produce. The real difficulty in the way of taxing unearned incomes to extinction, is the impossibility of a seizure of £800,000,000 every year by a Government which, as at present organized, has no means of immediately restoring that sum to general circulation in wages and salaries to employees of its own. This difficulty has been explicitly dealt with in *Fabian Essays* (page 189, etc.), in a passage which Mr. Mallock's criticisms do not affect.

The Long and Short of the Matter.

The long and short of the matter is that Mr. Mallock has confused the proprietary classes with the productive classes, the holders of ability with the holders of land and capital, the man about town with the man of affairs. In 1894 I advised him to take up the works of the Individualist American economist, General F. A. Walker, who, before the Fabian Society was born, expounded the economics of ability in a manner to which neither Fabians nor Conservatives have raised, or need raise, any objection. He did not take my advice until he went to America and was accused of borrowing from the General by somebody who must surely have understood neither of the twain. But now that he has read him, he can appreciate the following passage from the same author's *Money in its Relation to Trades and Industry* (London, 1880, pp. 90-91):—

The attitude of both laborers and capitalists [during a period of five years industrial depression in the United States] has given the strongest testimony that the employing classes are completely the masters of the industrial situation. To them capital and labor are obliged alike to resort for the opportunity to perform their several functions; and whenever this class, in view of their own interests, refuse that opportunity, capital and labor remain unemployed, incapable of the slightest initiative in production.

There you have your skilled economist. He does not romance about capitalists inventing Atlantic steamers: he shews you the capitalist and the laborer running helplessly, the one with his money, the other with his muscle, to the able man, the actual organizer and employer, who alone is able to find a use for mere manual deftness, or for that brute strength or heavy bank balance which any fool may possess. And the landlord must put his acres into the same cunning hands. The landlord, capitalist, and laborer can none of them do without the employer: neither can he do without land, capital, and labor. He, as the only party in the transaction capable "of the slightest initiative in production," buys his three indispensables as cheaply as he can; pays the price out of what he makes out of them; and keeps the balance as his profit. If a joint-stock company offers him as much by way of salary as managing director as he can make on his own account, he has no interest in refusing the post. If the Government, or a municipality, offers him equivalent advantages as a State or municipal officer, he will not scorn their offer from a sentimental attachment to "the

system of Conservatism." The Fabians have shewn that the situation is changing in such a way as to set our governing bodies, local and central, outbidding the private employer for the services of the laborer, and competing with the private capitalist and landlord for the services of the employer, whilst concurrently confiscating, by familiar constitutional processes, larger and larger portions of the land and capital that has fallen into idle hands. Mr. Mallock, in reply, bids the Conservatives be of good cheer, since he can prove that nearly all wealth is the product of ability and not of labor—no great consolation to those Conservatives who deal in neither, but only in land and capital. And to set at rest any lingering misgivings which his economic demonstrations may have left, he adds that the gobbling up of proprietary incomes by Social-Democracy, on Fabian lines, is not "fundamental Socialism," but only "incidental and supplementary Socialism," which, rightly considered, are "really examples and results of a developing Individualism." This explanation has been of great comfort to the Fabians. Whether it will be equally relished by the Conservatives is a question upon which I am too modest to offer an opinion.

NOTE.—The authorities for the figures given on pages 14 and 22, with many other particulars as to the distribution of income in this country which should be in the hands of every citizen, will be found in Fabian Tract No. 5, *Facts for Socialists*, Fabian Tract No. 7, *Capital and Land*, should also be read in this connexion.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

FABIAN ESSAYS IN SOCIALISM. Paper 6d.; cloth 1/6; post. 2½d. and 4d.

WHAT TO READ on Social and Economic Subjects. Fifth edition, revised to October, 1910, and enlarged. Interleaved, paper, 1s. n. cloth 2s. n., post. 2d.

CAPITAL AND COMPENSATION.

By EDWARD R. PEASE.

PUBLISHED AND SOLD BY
THE FABIAN SOCIETY.

PRICE ONE PENNY.

LONDON :

THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.

DECEMBER 1909.

THE FABIAN SOCIALIST SERIES.

VOLUMES NOW READY:

- I. **SOCIALISM AND RELIGION.** CONTENTS: (1) Christian Socialism, by the Rev. Stewart D. Headlam. (2) Socialism and Christianity, by the Rev. Percy Dearmer. (3) Socialism and the Teaching of Christ, by the Rev. John Clifford. (4) A Word of Remembrance and Caution to the Rich, by John Woolman, of the Society of Friends.
- II. **SOCIALISM AND AGRICULTURE.** CONTENTS: (1) The Village and the Landlord, by Edward Carpenter. (2) State Aid to Agriculture, by T. S. Dymond. (3) The Secret of Rural Depopulation, by Lieut.-Col. D. C. Pedder. (4) The Revival of Agriculture, by the Fabian Society.
- III. **SOCIALISM AND INDIVIDUALISM.** CONTENTS: (1) The Difficulties of Individualism, by Sidney Webb. (2) The Moral Aspects of Socialism, by Sidney Ball. (3) The Impossibilities of Anarchism, by G. Bernard Shaw. (4) Public Service *versus* Private Expenditure, by Sir Oliver Lodge.
- IV. **THE BASIS AND POLICY OF SOCIALISM.** CONTENTS: (1) Facts for Socialists, by the Fabian Society. (2) Capital and Land, by the Fabian Society. (3) Socialism: True and False, by Sidney Webb. (4) Twentieth Century Politics, by Sidney Webb.
- V. **THE COMMONSENSE OF MUNICIPAL TRADING.** By G. Bernard Shaw. With a new Preface. "Whether you agree with it entirely or not, you are bound to admit its intellectual power and persuasive eloquence. The volume should be read by all who are interested in social reform."—*Freethinker*.
- VI. **SOCIALISM AND NATIONAL MINIMUM.** By Mrs. Sidney Webb, Miss B. L. Hutchins, and others. "The joint authors of this excellent little treatise give unanswerable reasons for the compulsory adoption of the minimum wage."—*Clarion*.
- VII. **WASTAGE OF CHILD LIFE.** By J. Johnstone, M.D. "Passing from one count to another, he puts together his huge indictment of national extravagance; showing also how the practice of thrift might ensure to the nation the possession of healthy and efficient citizens."—*Daily News*.

The first four volumes consist of a revised, collected, and classified edition of some of the most valuable "Fabian Tracts" in a style more suitable for the general reading public. Each booklet contains not less than 96 well-printed pages, good paper and good type, and is supplied in two forms, i.e., in attractive wrappers at 6d. each, nett, and in quarter cloth boards, gilt top, at 1s. each, nett. Postage: Nos 1. to 4, 1d. and 2d. each; No. 5, postage 1½d. and 2d.

BALLADS AND LYRICS OF SOCIALISM. By E. Nesbit. 6d. net and 1s. net (postages 1d. and 2d.).

"These two lyrics alone ('Inasmuch as ye did it not' and 'In Trouble') raise E. Nesbit higher than all the excellent fiction she has written; they leave the reader angry and ashamed, with his humanity painfully stirred, and his self-satisfaction in rags. For the rest, 'here are . . . many appeals to freedom . . . fine hopeless-hopeful fighting songs . . . poignant little sketches of individual types . . . and poems of sheer revolt.'"—*Morning Leader*.

THE FABIAN SOCIETY, 3 CLEMENT'S INN, STRAND, W.C.

CAPITAL AND COMPENSATION.

SOCIALISM as a modern political force was born of a book, and that book was called "Das Capital" because its author rightly conceived that Socialism is far more closely concerned with capital than with anything else.

The reorganization of society on Socialist lines is necessary because capital has reduced the majority of the people to workers dependent on others for their livelihood, and the chief demand of Socialism is that the powers now exercised by the owners of capital over the lives and liberties of others should be transferred to the community.

Socialism and Capital.

Socialists have opinions on all sorts of subjects, and sometimes sections of them make those opinions parts of their creeds. Socialist societies have taken upon themselves to formulate dogmas on war and peace, religion and materialism, monarchy and republicanism, marriage and the family, the citizenship of women, and the education of children. But on many of these subjects there is hardly more agreement amongst Socialists than there is among Liberals or Tories, or Nonconformists, or any other group of people. On one matter alone are all Socialists all the world over in complete accord, and that subject is what ought to be done with capital.

The chief purpose of all Socialists is to transfer the capital of each nation from the hands of private owners to the community organized as the State.

What "Capital" means.

But what is this capital which we desire to transfer to the community? How many of the Socialists who so often talk about it have a clear idea of what it means?

Unfortunately, the word capital has an endless variety of necessary and yet incompatible meanings, all good and useful and appropriate to particular purposes, but so numerous and contradictory that the wise man will never use the word capital without explaining at the same time exactly what he intends to denote or connote by it.

Here we are concerned with the capital which Socialists desire to nationalize, the capital which yields interest and profits, and enables its possessors, if they choose, to earn salaries out of proportion to the value of the work they do. It is unnecessary, therefore, to consider

whether the skill of a doctor or of a professional billiard player is or is not capital, because clearly it cannot be nationalized by an Act of Parliament. Nor need we discuss the capital value of the English climate, which some economists rate highly, nor of our natural harbors and navigable rivers, nor of the alleged moral and industrial superiority of our race, to which some writers, English and not foreign, attach much value.

Nor need we consider the claims of goodwill to rank as capital, since the goodwill, say, of a soapmaking company, consists for the most part in the advantages, acquired as a rule by lavish expenditure in advertisements, which one concern possesses over other makers of soap; and its existence is bound up in the continuance of a number of competing manufacturers. Under a complete monopoly, whether of a trust or of the State, goodwill ceases to exist.

Capital is Things.

' Capital for our present purpose is all sorts of *things* in a certain aspect. Things have different aspects for different people or the same people in different moods. A steamer to the artist may be a color contrast on the horizon; to the engineer it is a means of livelihood; to the passenger a conveyance; to the investor it is so much capital. But although capital is all sorts of things in a certain aspect, its characteristics are chiefly determined by one sort of thing, and that is machinery.

This is a proposition to which Socialists should give ready assent. The capitalist system is recognized by them as an equivalent phrase to the régime of machine industry. The industrial revolution, the growth of the factory system, are their constant subjects of study. Machinery is not only the typical form of capital, but it is that which determines its chief characteristics. Subsistence, the food of the laborer, may be the seed; abstinence on the part of the owner may be a prerequisite; but the thing itself is neither abstinence nor food, but machinery.

Now the first thing to remember is that an aspect of a thing or a quality of a thing cannot exist apart from the thing itself. For instance, weight is a quality of things, and everybody at once realizes that if you want weight as ballast for your boat or your balloon, you have to get *things* that are heavy.

What is true of weight is equally true of capital. All capital, at any rate all that Socialists are concerned with, is *things* that are valuable.

Perhaps this statement may appear obvious and commonplace. Nobody supposed that capital was anything else. But is this so? Does everybody realize that when the London Joint Stock Bank takes up a block of £1,000,000 London County Council Stock, that transaction, represented by a few entries in a ledger, is in fact the transfer from the Directors of the Bank to the London County Council, not of so much gold, or of so much of an abstraction called capital, or of a still more elusive abstraction called credit, but of a claim upon a weirdly miscellaneous assortment of all sorts and kinds

of things—lands and houses, goods in warehouses and on the high seas, locomotives in Australia and elephants in India, in all of which the County Council proceeds to exercise certain possessory rights?

The Parable of a Plough.

Let me explain by a parable. Once upon a time in the Mid-Victorian Age there lived a farmer whom I will call A, an exceptional farmer because he was prosperous and kept accounts, who possessed a steam plough as good as new, which had cost him £100 and was worth to him, as he discovered from his accounts, £20 a year in increased yield from his land after providing for all repairs and expenses. He was so prosperous that he decided to retire, and rather than let his plough lie idle, he lent it to Farmer B for a payment of £10 a year. Farmer B also found that he got £20 a year profit out of the plough, and so he was £10 to the good by the transaction. Next year B thought he could do better still by buying the plough. A was willing to sell. So B borrowed £100 from the Banker C on the security of the plough at five per cent. per annum, bought the plough of A, and paid for it by a cheque on the Banker C. A paid the cheque also into the bank of C, and put it on deposit at three per cent.

Now this simple transaction in fact contains in a nutshell the essence of all finance.

In the first year there was one man owning a plough which yielded £20 of profit, a machine, that is, which produced so much wealth, all going to the owner, A.

In the second year two men were concerned, A, the owner, who still owned the plough, and got £10 a year for lending it to B. B had the use of the plough and netted £10 a year clear profit. Still there was only one plough, yielding one profit of £20.

In the third year things were still more complicated. A had £100 on deposit at the bank, and was drawing £3 a year interest. B had a steam plough, yielding £20 a year, out of which he paid £5 as interest to the Banker C. C, the Banker, had an increase of his deposits of £100 on one side, and on the other a new loan of £100 secured on the plough. He received £5 from the borrower and paid £3 to the lender, so that he had £2 clear profit on the operation. All these men felt rich and prosperous: all were making interest or profits; all could talk of their capital and their loans; and yet all the time there was but one steam plough, yielding as before a profit of £20.

What is true of this steam plough is true of all financial and commercial transactions. In the last analysis loans and bank deposits, stocks and shares, cheques and bills, mortgages and debentures, all are founded on things—real, tangible things like ploughs. Their capital value depends on the value of these things, and the interest that they yield is produced by the things they represent, or, in other words, is due to the fact that the man with a machine, of whatever sort, can produce more wealth than the man without the machine.

Capital : Land : Wealth.

Capital, then, is things and nothing else whatsoever : of course it includes land. For the purposes of this argument no distinction between land and capital is possible. The wealth or the capital of the country (and there is no clear distinction between the form of wealth usually called capital and any other forms of wealth) consists in houses and lands, in machinery and goods, in stone and iron and coal, in cattle and corn and cotton ; in gold and a little silver and bronze, all tangible things, and in nothing else at all. This is the capital with which finance is concerned ; and this is the capital which we Socialists desire to nationalize.

It is perhaps difficult to realize that the 50 millions of deposits in some London bank, apparently a series of figures in ledgers, all expressed in terms of money, and convertible at longer or shorter notice into gold sovereigns, are in reality not money, or some abstraction called capital, but nothing else than such things as ploughs and the land they plough.

One great reason for this confusion of thought, this idea that capital is something apart from tangible things, is the fact that there is in commercial and general language another and quite different significance of the word capital.

The Capital of a Company.

The capital of a company is not things, and bears no necessary relation to things. When a mining company is started, a number of people who have capital, that is things, contribute (or lend) their things, say fifty each lending £1,000 worth of things to the promoters ; and they are allotted shares in the mine in proportion to their contributions. But the promoters allot to themselves for their services, real or imaginary, for their concession, for the mine, and so on, such other shares as they think fit, say another £50,000.

The whole "capital" of the mine then stands at £100,000, and this means that the ownership of the mine and the profits, if any, are divided amongst the shareholders in proportion to their holding of the "capital." Every holder of £1 in shares is to get one one-hundred-thousandth of the profits.

This capital therefore does *not* represent things. And of course the commercial world instantly recognizes this. Once the mine is started the value for buying and selling bears no relation to the capital. The £1 share may sell at £30 or at 6d. Its market price depends on the actual earnings and the valuation attached to the right to these earnings ; it depends, that is, on the things which the company possesses.

The value of these things is not in any way affected by the capitalization of the mine. If its net earnings are £10,000, it will pay ten per cent. on a capital of £100,000 or twenty per cent. on a capital of £50,000 or one hundred per cent. on a capital of £10,000.

Railway Stocks.

It is particularly important for Socialists to realize that the "capital" of such concerns as railways is now nothing else than a means for determining how the profits and control of the company shall be divided. A £100 North Eastern Railway Stock is not so called because the original subscriber paid £100 into the company. The capital of a company was often issued at a discount; that is, £100 of stock was given by the company for £70 or £80 or £90 in cash. On the other hand it is sometimes issued at a premium. The North Eastern Railway some years ago sold to the public a quantity of stock at £150 for each nominal £100 of "North Eastern Consols" issued. It does not mean that that part of the property of the railway is now worth £100. Only by a rare and mere chance is £100 railway stock bought or sold for £100. It may be worth anything from £10 to £200.

The capital of a company can be written down or watered up, just as the owners please, and it makes no direct difference to anybody else.

It is not necessary to discuss here various other sorts of company capital, guaranteed, preference and debenture, and so on. Such stocks represent other claims in addition to shares in the property. But these are details not affecting the main argument, which is that the share capital of a company is altogether a different sort of capital from the capital which is the main theme of this paper.

Consols and Municipal Stocks.

There is another sort of capital of which a few words must be said. What relation, it may be asked, have Consols, or Turkish Bonds, or London County Stock to things? The relation is this. The loan of a State or municipality consists originally of things—currency representing things—lent by private citizens to the State. In exchange they receive a charge on the property of the State, which is, for this purpose, the property of all the citizens. In fact, an owner of private property only holds it subject to any claims of the State against it. This is a truth of which passive resisters, whether Free Churchmen or Tax-refusing Suffragettes, are made acutely conscious. The State, central or local, has a claim on, that is in fact owns, a part of the possessions of each citizen. It demands its rates and its income-tax. If the citizen pays its demand, all is well. If he neglects or refuses to pay, the State promptly seizes his silver spoons or any other property it can lay hands on, and sells them at auction. Consols or London County Council Stock represents those things which private persons hold, subject to the claim of the State. The owner of land has to pay one part of its produce to the local authority and another part as land and income taxes to the revenue; and if, on the average, landlords pay twenty-five per cent. of the value of their land to the State, we may properly say that the State owns a quarter share of the land, and that it has transferred this ownership to the holders of Consols and municipal

loans, who are the real recipients of the income-tax and the rates. It is the case of the plough over again. As A, in reality, had not £100, but a plough valued at £100 in his bank, so the holder of Consols possesses in reality the essence, as it were, of the land and the many other things on which his right is secured, and out of the profits of which his interest is paid.

Interest on Capital.

What is true of capital is equally true of interest and profit on capital. That also consists of the things which capital—machinery—adds to the product of labor. The steam plough in the parable, by enabling the soil to be cultivated more thoroughly, produced more grains of wheat, heavier turnips, a greater growth of clover. The value to the farmer of this extra product, after all extra expenses had been met, was £20. The interest, then, even that ultimately paid through the bank to the depositor, was in essence wheat and turnips and clover. The depositor could draw interest because the plough produced larger crops.

All commercial interest is of this character, and all capital can command interest because some capital can always produce things which without it would not exist at all.

It is a common idea amongst some Socialists that there is something rather wicked in interest. Indeed they often say that interest under Socialism would be forbidden. Sometimes they seem to fancy that interest is the same as repayment of capital, and argue that payment of five per cent. for twenty years should be held to pay off the loan. Again, our Anglican brethren quote with much gusto the strong language which the Fathers of the Church used about a very different matter—*usury*, that is, the taking of interest for the loan, not of capital, but of means of subsistence. The Shylocks of old and the modern money lender are quite proper subjects of denunciation by bishops and judges and other superior persons. But that sort of borrowing and lending of money, the pandering to the vices of the dissolute, or the battenning on the necessities of the unfortunate, is a quite different thing from the loan transactions of Lombard Street and the great commercial system of borrowing and lending for the purposes of business.

Interest as the yield of industrial capital is an ultimate fact. The man with the plough can raise more wheat than the man with the spade. The woman with a sewing machine can make more shirts than the woman who sews by hand. So long as more machinery is required, until the world has all the machines that anybody wants, the man or the department with a machine will be more efficient than the man or the department without it; and that efficiency, that larger product, is interest. Interest is no more anti-social than rent, and is practically as eternal. What Socialists properly denounce is the *private ownership* of capital and of the interest it yields, just as they denounce the private ownership of land and of the rent that accrues from it.

Capital isolated from Things.

I have said that capital is things and nothing else than things, and that it cannot be separated from things. That is a proposition, like so many in economics, which you have first to get thoroughly into your head and then to get out again.

It is true that Farmer A's £100 deposit in the bank was entirely dependent on the plough. In fact, it was the plough. Obviously there was nothing else but some orders written on paper.

But, none the less, those orders altogether changed the situation. In fact, A possessed not a claim on that particular plough, but equally on countless other things, all temporarily pledged to the bank. Moreover the transaction had, so to speak, extracted and isolated the capital out of the plough, so that A owned the qualities of the plough which are capital, and B owned and administered all the rest.

The whole secret of the financial system of the present day is this divorce between ownership and administration of capital. The banks are great pawnshops, where one set of people deposit as pledges cargoes of cotton and wool and wheat, lands and houses, ships and factories, the profits of which go in part to those who administer them, in part to the banker for his services and risks, and the rest to the depositors in the bank, who in the last resort have a right to them.

Everywhere this system prevails in name or in fact. Nominally the shareholders in a railway or a great joint stock "industrial" control their company through their elected board of directors. In fact, they do nothing at all but cash their dividend warrants.

In the case of bank deposits, municipal and Government loans, mortgages on land and houses, and many other things, the owner of the capital has no control whatever over the use which is made of it. He finds the money, but he does *not* call the tune. All he can claim is his pound of flesh, his half-yearly interest warrant.

Control divided from Ownership.

The importance of this distinction between the administration of capital and the ownership of capital has not, I think, been adequately recognized.

In the gradual transfer of capital from individual to communal ownership and control, it plays a principal part, because the ownership and the control of capital are transferred at different times and by different methods.

When, as recently happened in London, a waterworks company is taken over by the community, and water stock is given to the shareholders in exchange for their shares, the administration of industrial capital is transferred to the community, but the ownership may fairly be said to remain in private hands. London in 1908 was not only no richer, but even poorer than before the change was made. All the profits of the waterworks were needed to pay the interest on the water stock.

The position is exactly that described in the third year of the parable. London has the use of the water plant as Farmer B had the use of the plough, but London has to pay the real owner, the old shareholders, just as Farmer A still drew his share of the profits of the plough after he had sold it to B.

Transfer in Two Stages.

In practice, the transfer of capital to the community is always taken in two stages. At the first stage the State takes over the administration, as of gasworks, tramways, telephones, waterworks, and so on; and at this stage the State always compensates the dispossessed owner by giving him a charge on the profits of the thing transferred or, what is equivalent, by giving him cash.

In these cases compensation is always given because it accords with the sense of justice of the community to pay it; in other words, both parties to the transaction expect this course and are satisfied to take it. The city or community gets its waterworks and the shareholders get, what in reality is all they cared for before, an annual payment of interest and a saleable "stock," that is, saleable documents giving the right to receive this annual interest and an ultimate right to a lump sum.

We "compensate" then when we take over the administration of capital by dividing it into two parts; the State takes the control of the actual things, and leaves to the original owners their wealth producing qualities, that is, their capital value.

But how about the next stage?

We can give water stock in exchange for the plant of water companies, but when we want to take the water stock, what exchange *can* we give? To buy it is of no avail. The purchase by the State of £100 of stock at the market price does not affect the distribution of property. The private owner formerly possessed one sort of capital and later possessed another sort; but the amount he possesses is not altered. Capital in the form of stocks or Consols or cash is interchangeable because it is sublimated and refined till it may be said to be absolutely pure. It has no specific powers; it involves no duties; it requires no abilities. It is simply and purely the right to levy a tax on the labor of the community. It may be beneficial to that community if it is expended in scientific research or the endowment of education, or in the proper support of the old and the sick. But usually it is the means of livelihood of the idle rich.

This distinction* between ownership and administration of capital is the key to the compensation difficulty. It is found convenient to compensate when the administration of capital is transferred; but when the turn comes for the ownership also to be transferred, it will prove not only inconvenient, but impossible, to compensate, except on some such lines as a "time limit," which is not really compensation, but confiscation with notice.

* It is expressed in French by the contrast between "l'usufruit" and "la nue propriété."

Analysis of Ownership.

Ownership of capital, therefore, is by no means so simple a matter as is often supposed. It may be classified into four categories :—

The first is complete and undivided ownership. Such was Robinson Crusoe's ownership of his hut and his canoe, and even of his man Friday. No law or State Government controlled his power to do what he liked with his own : no landlord or mortgagee, no debenture holder or shareholder or stockholder had any claim on his wealth.

Outside fiction, the British factory owner a century ago, the Southern States factory owner of to-day, and, in practice, it is said, the American millionaire trust owner, is nearly in that position. These men can or could use their capital to achieve their ends as they think fit, and no power on earth or elsewhere holds them in check.

The second form of ownership is when a capitalist may only do with his own as far as the community thinks fit. The owner of a cotton factory in Lancashire or in Germany is subject to a quite stupendous code of laws, which tell him what he may do and what he may not do with his capital. One set of rules lays down how he shall build his factory ; another set provides for the sort of machinery he must put in. The hour of opening and of closing is fixed by law, the place where he must pay his hands, and the form in which he is to pay them. Other laws regulate whom he may employ, and how many hours a week he may work children, young persons, and women. A quite other set of regulations is imposed on him by his employers' association and the trade union.

The second pair of categories which divide ownership of capital on a different plane has already been described. Farmer A at first owned his plough right out. All its profits went into his pocket. Except for the claims of the community for taxes, etc., he was full owner. At a later stage Farmer B also owned the plough, but it was charged with a loan from the bank, and part of the profits ultimately came to Farmer A as before. The possession was, in fact, divided ; A owned, B administered.

The Politics of Capital.

The task of Socialism in relation to capital is therefore threefold.

It has to meet and overthrow the ideal of *laissez faire*, that of the capitalist who can do what he likes with his own. It clips and curtails his power to harm by Factory Acts, Sanitary Acts, Truck Acts, Minimum Wage Acts, Eight Hour Acts, and every other device that can be discovered for restraining his vicious propensities. It encourages trade unions, which regulate what the law cannot yet touch, and co-operative societies, which oust him from his most profitable preserves.

The next step is to seize on the administration of his property. It takes his gasworks and his waterworks, his trams and his tele-

phones and his railways. It no longer allows him to manage them even under the strictest of regulations, but transfers them to itself and pays him a fixed share of the profits as compensation for his property.

But it must here be noted that the share of the profits of capital, usually called *interest* in the narrower sense, which goes to "pure" capital is a small one. In the plough parable the yield of the plough was put at twenty per cent., and the interest received by A when he deposited his plough at the bank was only three per cent. The return on capital embarked in industry is very various, and the risk of its loss has always to be allowed for. But, as a rule, the trader earns between five per cent. and fifty per cent. on his enterprise; and if he uses capital lent to him, through a bank for example, the ultimate owner of the capital only receives three or four per cent.

The transfer to the community of the administration of industrial capital therefore involves the transfer of the administrator's share of the profits, and this is a large one. The gas and waterworks of our provincial towns, the electric lighting works and the tramways of London, yield very large profits indeed over and above the interest paid to the private persons who hold the municipal stock.

The transfer of the administration of industrial capital to the community is a comparatively simple process. It is going on around us every day. Parliament when it grants franchises for any local monopoly carefully provides nowadays, as French law has long provided with regard to the railways, that it may take place in due time.

We want to speed up the machinery, of course. We want to take over the railways next year and the mines the year after, and then the cotton factories; and we know that it will not be done at that rate. Still it is quite simple, if we steadily bear in mind that this step in the process is, and must be, separate from the step of transferring the ownership; and there is every possible disadvantage in confusing the two.

The last step is the transfer of ownership of capital from private persons to the State, and this the community has hardly yet begun. It has made some attempt to pay off its national debt, which may be regarded as a mortgage, in the first instance, on its industrial capital, such as the Post Office. Local authorities which borrow in order to purchase gasworks and trams, or to build houses or buy small holdings, are required to save out of their rates or their profits in order to repay the loan, that is, to buy out the real owners. Josiah Wedgwood, M.P., has made the useful suggestion that local loans should be arranged for short rather than for long terms of years, because the shorter the term the quicker the public authority is compelled to accumulate capital. But all this is the saving of new capital and not the transfer from private holders of existing capital.

If, however, the State constantly accumulates new capital and private persons gradually cease to do so, the share of the capital of the nation in private ownership will gradually decrease.

Quantity versus Quality of Capital.

But there is another consideration. It is commonly believed that the moral validity of the right of private ownership in capital varies according to the quality or kind of that capital. It is thought, for instance, that the moral right to ungotten minerals or mining royalties is highly disputable, since it is obvious that the owner took no part whatever in creating them. The case against private ownership of uncultivated land is scarcely less strong, and all land values are held by many people to belong properly to the State. But against this contention it is argued that all these rights have been bought and sold freely for generations, and since Consols, state obligations whose validity is generally held to be beyond dispute, can be sold and the proceeds invested in mining royalties, it is unfair to penalize the owner of one class of property at a given moment as compared with the owner of another class. In effect the State has guaranteed all classes of ownership equally, and it must not turn round and declare its sanction in one case less valid than in another.

On the other hand, we may have regard to the quantity of property in individual ownership. It has always been held that the rich should contribute more to the State than the poor. Excessive wealth is universally regarded as a public danger. By common consent the objectionable feature of modern civilization, as of that of ancient Rome, is the possession of great wealth by a few, with the accompanying poverty of the masses.

In this connection the kind or quality of the wealth is irrelevant. If some regard the great landlord with special disapproval, others concentrate their hostility on the Stock Exchange financier, and a third set reserve their censure for the trust magnate. This much, therefore, seems clear, that in the measures taken to transfer capital from private to public ownership, regard must be had in the main, not to the quality, but to the quantity, of the property owned by each person. We shall deal with the rich owner as opposed to the poor owner, and not with mining royalties or land values as opposed to steel trust stocks or steamship shares.

Capitalists as Bondholders.

There is another reason for this. We have already explained that whenever the community takes over any particular things—gasworks, tramways, railways—it compensates by giving stocks or borrowing the necessary money on stocks, and thus reduces ownership to a common denominator of annuities payable by the State. As this process goes on, the private owner of capital will become more and more a receiver of a fixed income from the State. The privately owned capital of the future will be gradually reduced to its simplest terms, the payment to individuals by the State of the income, or a part of it, from the property they or their predecessors formerly held, which has been taken over in exchange for water stock, or gas stock, or Consols.

All we shall then be able to consider is the quantity of State obligations held by an individual. Any differentiation between one

class of State guaranteed stock and another, any historical enquiry whether it was given in exchange for mining royalties or for inventions and patent rights, will be impossible.

Capital in Consols.

Consols are properly called Two and a half per cent. Annuities. In reality each £100 consists of the right to receive £2 10s. per annum, with the right *to the State* to redeem that payment by a lump sum of £100. Some stocks give rights to the holders to claim repayment after a term of years, but this right only has value when the market price of the security is below par. When it is above par, the right is useless; and if the company or corporation has the reciprocal right to pay off at par, it becomes a disadvantage. Moreover, public authorities nearly always extinguish their obligations by purchase, if the price is below par. We may therefore disregard the nominal capital amount of State obligations. Their only important feature is the annual payments. The nationalization of the ownership of capital will therefore gradually take the form of the extinction of annual payments made by the State to individuals, and it is easy to see that this will take place in two ways.

Income Tax and Death Duties.

Any deduction made by the State from these annuities is pro tanto an extinguishment of them. A two shilling income tax is a reduction of the State debt by ten per cent. Already the State has begun to differentiate against unearned incomes, and this process will no doubt continue.

The idle rich, the recipients of income which comes to them by inheritance or gift, pensioners of the community on account of ancestral rights to capital acquired under an ancient and abandoned system, will be regarded by our enlightened successors as obvious subjects for the heaviest taxation.

Secondly, there are the death duties. Already the State takes no inconsiderable share of property left at death. The time is not far distant when the right of inheritance will be still more narrowly limited. Before long the principle of the death duty and the super tax will be largely extended.

One millionaire has already enunciated the doctrine that no man should die rich. A simple deduction from this is that no man should live rich, and the habit of regarding millionaires as social pests is rapidly growing. Legislation deliberately directed to penalizing the wealthy in the interests of the community already commends itself to the community. The "vindictive" Budget of 1909 appears to be a popular measure.

Moreover, the right of inheritance and bequest should be closely limited. At present the State only puts in a claim when it has exhausted every effort to discover the remotest cousin of a dead property owner who has been too lazy to dispose of his own fortune. The press and the lady's maid novelists would no doubt deplore a world state in which rich uncles dying in Australia or remote

cousins slain in railway accidents were no longer possible rescuers of the poor but well-born hero, eager to wed the lovely daughter of the haughty earl. But such Ollendorffian occurrences will not be wanted to add zest to a world busy with the thrilling task of social reconstruction on a large scale. The State might well enact in a future not excessively remote that it should be the sole heir of all who die without children.

A third method, already adopted in the case of Indian railways, is to give terminable, or perhaps life, annuities in place of the perpetual annuities which we usually call stock or bonds.

Summary.

The argument is now concluded. It has been shown that the capital which we have to nationalize is exclusively tangible things, but that our financial system, the great structure of credit which economists describe with reverent wonder, consists of isolating the value of these things, so that the ownership can be separated from the control.

We have next seen that the State nationalizes capital in two stages. It first takes over the administration and control, and compensates the private owners by leaving to them the value of the capital in the new form of annual payments of interest. The second step is to transfer the ownership itself. In this distinction we have found the explanation of the confusion on the subject of compensation in the minds of Socialists, who maintain that compensation is both unjust and impossible, although they acquiesce in and sometimes advocate it in any particular instance of the taking over of the administration of actual things.

Compensation, we have shown, is both possible and proper when the State takes over the administration of capital. It is impossible when the ownership (in the sense just explained) is taken over, and therefore it is unnecessary to consider whether it is just or politic.

Finally, we have discussed the methods by which the ownership of capital will be transferred to the State, and have taken the view that no distinction can be drawn between various classes, or kinds, or sorts, or qualities of capital. All we should do is to differentiate between owners of much and owners of little; in other words, between the relatively rich and the relatively poor.

With the wide expansion of social reconstruction which must accompany this transfer of capital to the State we have here no concern. Nor is there space to deal with the new organization of industry which must follow it.

The purpose of this paper has been to indicate the nature of the capital which Socialists desire to socialize and the methods by which it is being and will be emancipated from private ownership and control and transferred to the community for the use and benefit of the whole people.

FABIAN SOCIETY.—The Fabian Society consists of Socialists. A statement of its Rules and the following publications can be obtained from the Secretary, at the Fabian Office, 3 Clement's Inn, London, W.C.

THIS MISERY OF BOOTS. By H. G. WELLS. 3d., post free 4d.
"THOSE WRETCHED RATES!" a Dialogue. By F. W. HAYES. 1d.

MARCH 1910.

WHAT A HEALTH COMMITTEE CAN DO.

"With all deductions the triumphs of sanitary reform, as well as of medical science, are perhaps the brightest page in the history of our century."—W. E. H. LECKY.

MEMBERSHIP of a Health Committee opens up opportunities for social work of the highest importance. The duty of a Health Committee is a very extensive one. It is to prevent all preventable sickness in their district, from whatever cause, and to see that no sickness goes neglected, whatever its nature. Public health administration in the past has done wonderful things in the way of preventing disease and prolonging life. Typhus fever and relapsing fever, which were formerly scourges of the poor, have been swept out of the country; the mortality from typhoid fever, scarlet fever and tuberculosis has been greatly diminished, and the general death-rate has fallen from 21·8 in 1848 to 14·7 in 1908.

Amongst the many influences which have been at work to bring about these results public health administration has certainly been the most important. But although much has already been accomplished, much remains to be done, and the object of this tract is to show in what directions further progress can and ought to be made.*

A Whole-time Officer of Health.

The Medical Officer of Health is the chief of the Public Health Department, and much depends on what sort of man he is and how he is supported by the Health Committee. It is most important that he should devote the whole of his time to public health work. All areas of not less than 50,000 population should have a whole-time Medical Officer of Health, and in many districts with less population, especially industrial towns with a large number of workshops, and scattered districts covering a wide area, a whole-time Medical Officer of Health is necessary. Private practice greatly interferes with his public duties. If he is a capable, energetic and popular man—and a Medical Officer of Health should be all this—he will gain a large private practice and can find little time for his public health duties. Moreover, you cannot reasonably expect a Medical Officer of Health to expose the insanitary cottages or slum dwellings owned by his own clients. Smaller districts should combine together to appoint a whole-time officer, which can be done under the Public Health Act, 1875 (Sec. 191). Towns over 50,000 need one or more Assistant Medical Officers. It is essential that every

* This tract applies more particularly to England and Wales, outside the County of London. In London the Public Health powers are divided between the L.C.C., the Metropolitan Borough Councils, and the Metropolitan Asylums Board.

Medical Officer of Health should be specially qualified for his work, and therefore no applicant should be considered who does not possess the Diploma of Public Health (D.P.H.).

The Health Committee should see that only

Whole-time Sanitary Inspectors

are appointed. Unfortunately, in many districts the sanitary inspector (or inspector of nuisances, as he is called outside London) is also surveyor, and may even hold other posts. This always leads to the public health work being neglected. In the Urban District of Braintree with a population of 6,000 the inspector of nuisances is also surveyor of highways, surveyor of buildings, engineer to the waterworks, engineer to the sewage works, surveyor to the cemetery, and superintendent of the scavenging. For three months this inspector was engaged in re-numbering the houses in the town, and had no time for his other duties.*

A sanitary inspector should devote the whole of his time to his duties and he should hold a proper qualification. On no account ought any candidate to be appointed merely because he is a good fellow, or a honest man, or the victim of misfortunes, or the friend of one of the Councillors. The qualification recognized by the Local Government Board is the certificate of the Sanitary Inspectors Examination Board, without which no sanitary inspector can hold office in London. The certificate of the Royal Sanitary Institute is, however, a good qualification. At least one of the sanitary inspectors of any district should hold a special certificate qualifying him in meat inspection.

How many Sanitary Inspectors are wanted ?

This depends upon the population, area, and social circumstances of the district. An industrial district covering a wide area will need more inspectors (among whom there should always be at least one woman) than a residential district of the same population with a smaller area. Furthermore, county boroughs administer the Food and Drugs Acts, which in the smaller boroughs and in urban and rural districts are under the charge of the County Council. As a general rule a district should appoint not less than one sanitary inspector to every 10,000 population, in addition to health visitors ; and if the women inspectors act also as health visitors more inspectors are required.

The most progressive towns already exceed this scale. For instance, Liverpool employs 43 male sanitary inspectors and 21 female, besides a milk depôt staff, inspectors of meat and animals, of fish and fruit, inspectors under the Food and Drugs Acts and the Factory and Workshops Acts, and others. The total sanitary administration staff consists of 162 persons (116 men and 46 women) besides the clerical staff. This is about 2 per 10,000 population.

* Dr. Reece's Report to the Local Government Board on the sanitary circumstances of Braintree.

Women Sanitary Inspectors

are particularly needed in districts where female labor is employed. The women inspectors should ascertain whether proper and sufficient sanitary conveniences are provided for women in factories, workshops and work places, and they should supervise the general sanitation of workshops and work places where female labor is employed and of the homes of outworkers. Women inspectors may take part in house-to-house inspection and in the supervision of tenement houses, and they can do very useful work in making enquiries in cases of infectious disease, investigating cases of overcrowding and other insanitary conditions. In some districts the women sanitary inspectors devote part of their time to health visiting; in others this work is carried out by special

Health Visitors

who give their whole time to the work. Health visiting is a most important department of the work of a Health Committee, and in every district there should be one or more properly salaried and qualified women for this work, as well as a staff of volunteer helpers.

The duties of health visitors are various, but perhaps most important is to visit mothers in their own homes and to give sympathetic counsel on what is necessary for the successful rearing of babies. It is desirable that the health visitor should have had some experience in nursing, and even if she is not to be employed as a sanitary inspector she should have had training in practical sanitation and should possess a certificate as a sanitary inspector.

An enquiry instituted by the National League of Physical Training shows that in at least ninety places there are one or more health visitors paid entirely from the rates, in twenty places there are from three to four women sanitary inspectors whose official duties include health visiting. In many districts bodies of voluntary health visitors have been organized, and if these are carefully supervised by the paid staff the results are often satisfactory. In thirty-five districts it is believed that infant mortality has been reduced through health visiting, and these include such towns as Glasgow, Hanley, Huddersfield, Macclesfield and Middlesbrough, where the conditions cannot be considered generally favorable to infant life.

At Brighton the Town Council has started municipal home nursing. A trained nurse is employed who attends at home on such cases as puerperal fever or erysipelas, when removal to hospital is not considered desirable. Nurses to visit the sick poor in their homes are also provided by the Health Committee of the Worcestershire County Council, and this example might well be imitated elsewhere. The Barry Urban District Council also sends out its hospital nurses into the homes.

Having briefly described the chief officers of a health department, we may now proceed to indicate some of the more important features of its work.

Now the bulk of a Health Committee's work may be summed up by saying that it strives to secure

Systematic Cleanliness.

"Cleanliness," said Sir B. W. Richardson, "covers the whole field of sanitary labor. It is the beginning and the end." This rather overstates the case ; but at all events we may agree with Sir John Simon, who said that "Uncleanness must be reckoned as the deadliest of our present removable causes of disease." We want cleanliness in many places, and in the first place we want

Cleanliness in the Atmosphere.
